  - The remaining 8 were an alcohol, a pthalate, a substituted alkane, chemical oxygen demand (COD), pH, total dissolved solids (TDS), total alkalinity and one miscellaneous organic compound.

- Of the 95 parameters detected in C&DD leachate, 28 exceeded health based standards, including:
  - 16 heavy metals, light metals, and trace elements.
  - 4 chlorinated solvents and pesticides.
  - 4 other ions and TDS.
  - 4 that were a gasoline component, a PAH, a phenolic, and a phthalate.

- Of the 95 parameters detected in C&DD leachate, 46 exceeded surface water quality standards, including:
  - 18 heavy metals and trace elements.
  - 10 chlorinated solvents and pesticides.
  - 5 other ions and TDS.
  - 4 phenolics.
  - 2 gasoline components.
  - 2 light metals.
  - 2 PAHs.
  - 3 that were a non-chlorinated solvent, a phthalate, and a substituted benzene.

- Of the 95 parameters detected in C&DD leachate, 52 raised a concern when compared with health based standards or surface water quality standards. Of those 52 parameters, 27 raised a concern with both sets of standards.

- Of the 95 parameters detected in C&DD leachate, 18 were identified in a 2008 Ohio EPA study as showing indications of impact on ground water at Ohio C&DD landfills, including:
  - 6 light metals and trace elements.
  - 4 other ions.
  - 2 gasoline components.
  - 6 that were a substituted benzene, a heavy metal, COD, pH, TDS, and total alkalinity.

Introduction

Ohio EPA is revising its C&DD disposal rules pursuant to legislative changes that occurred in late 2005 (see Attachment 1 for Ohio's definition of C&DD). By statute, the C&DD program in Ohio is administered by Ohio EPA and local health departments approved by the director of Ohio EPA. The majority of Ohio's C&DD landfills are regulated directly by approved local health departments. Ohio EPA promulgates rules and guidance documents, and provides technical assistance to the health departments. The local health departments issue licenses, conduct inspections, review data submittals, and conduct enforcement actions when needed, at times assisted by Ohio EPA.

The first Ohio C&DD rules were developed through negotiations with stakeholders in the early 1990s. There was little environmental data available to Ohio EPA. Leachate monitoring and ground water monitoring at these landfills was rare in Ohio, as was the case nationally. When ground water monitoring was present at C&DD landfills, the standards for ground water monitoring were inadequate to document background ground water quality and to determine if landfills were impacting ground water (National Demolition Association, 1995).

The industry put forth the assumption that C&DD is largely harmless or relatively inert material and that state-of-the art demolition landfills pose no significant environmental risk (National Demolition Association, 1995). The industry also indicated that it is unlikely that leachate from a state-of-the art demolition landfill would exceed U.S. EPA primary drinking water standards (National Demolition Association, 1995). As a result, the siting, engineering, operational, and monitoring requirements in the first set of Ohio rules, which were effective in 1996, were limited. That set of rules was largely consistent with rules in 40 other states that were surveyed by the National Demolition Association (National Demolition Association, 1995).

Since the mid-1990s a number of reports were published from such organizations as U.S. EPA, the University of Florida, Hamilton County Health Department in Ohio, and the Florida Center for Environmental Solutions. The reports evaluated the characteristics of C&DD leachate and impacts C&DD landfills were having on ground water and surface water. The following are examples of such reports.

In 1995, U.S. EPA published a draft report that found 11 cases of damage from C&DD landfills. Damage included ground water contamination that exceeded state ground water protection standards or federal drinking water criteria from inorganic parameters, such as iron, manganese, total dissolved solids (TDS), and lead. Surface water and sediment contamination that exceeded applicable state standards and U.S. EPA's ambient water quality criteria for the protection of freshwater aquatic life was documented at six sites. The contamination was due, most frequently, to parameters such as iron, zinc, lead, copper, and pH, with two sites showing contamination from polynuclear aromatic hydrocarbons (PAHs). The study concluded that there was insufficient data for U.S. EPA to determine whether C&DD landfills pose sufficient risk to human health and the environment to warrant additional controls nationwide (US EPA, Draft 1995b).

In 1995, U.S. EPA also published a 305-parameter evaluation of C&DD leachate from 21 landfills. Of the 305 parameters, 93 parameters were detected at least once. Almost all of the other 212 parameters that were never detected were organic compounds. Most of the inorganic and conventional parameters sampled were detected one or more times. The report also states

that 24 parameters had at least one measured value above regulatory or health-based standards. Seven parameters in C&DD leachate were identified as potentially problematic: 1,2-dichlorethane, methylene chloride, cadmium, iron, lead, manganese, and TDS. The report indicated that having data from only 21 landfills was insufficient to determine if the results were representative of C&DD landfills nationwide. (US EPA, Draft 1995a).

In 2001, Hamilton County General Health District in Ohio published its findings of the review of ground water data from wells around seven C&DD landfills in Hamilton County. The conclusions of the report included detections, sometimes above health based standards, of such parameters as iron, manganese, sulfate, chloride, lead, nitrate-nitrite, ammonia, 1,1,1-trichloroethane, carbon disulfide, and other organic compounds. However, due to site conditions and the sporadic nature of some of the detections, the health department could not determine if the landfills were the source of the elevated parameters (Hamilton County General Health District, 2001).

After evaluating the data contained in the Hamilton County report, Ohio EPA concluded that more information is required for the seven landfills to provide a conclusive evaluation of the ground water quality. However, based solely upon the limited information provided, the data indicated that at least four of the seven landfills may be impacting ground water quality (Ohio EPA, 2006).

In 2002, Townsend et al. provided an update of current rules and an assessment of environmental impacts by C&DD landfills in the U.S. The report concluded that issues involving C&DD waste had become more of a concern, as evidenced by almost half of the states requiring some sort of liner for C&DD landfills, and hydrogen sulfide gas having been a concern at some landfills. For ground water monitoring impacts evaluated in the report, 60 of 70 landfills were shown to have at least one exceedance of a parameter in downgradient wells. From 3 to 17 Florida landfills were found to exceed ground water standards downgradient from the landfill for aluminum, TDS, sulfate, ammonia-nitrogen, iron, cadmium, lead, total phenols, bromodichloromethane, chloride, nitrite-nitrogen, benzene, chromium, copper, pH, sodium, arsenic, methyl bromide, trichloromethane, mercury, dibromochloromethane, and turbidity (Townsend, Jambeck, & Clark, 2002).

in 2004, Townsend et al. concluded that there is a potential for concern with respect to leachate quality from lined landfills, ground water quality at unlined landfills, and processed wood mulch from C&DD that includes treated lumber. Townsend also wrote that additional research was needed to determine the magnitude of the problem at actual disposal sites (Townsend, Tolaymat, Solo-Gabriele, Dubey, Stook, & Wadanambi, 2004).

In 2006, Clark et al. summarizing several other studies stated,

> Various potentially dangerous materials, however, are now recognized to occur in some sources of C&D debris. Heavy metals such as lead (paint, pipe solder, flashing, batteries), mercury (lighting, electrical switches, thermostats), cadmium (batteries, paints), and arsenic (treated wood) are common ingredients of many building components. Polychlorinated biphenyls are still encountered in many older lighting ballasts, transformers, and capacitors, as well as numerous other materials. Asbestos building products include floor tiles, roofing mastic, pipe insulation, and cement siding. As a result, the unsafe management of C&D debris can pose a risk to human health and the environment from its generation (e.g., the demolition process) to its final disposition (e.g., disposal in a landfill).

> Even the primary building components themselves (e.g., drywall, wood) can impact the quality of ground water underneath an unlined C&D debris disposal facility. The growing awareness of potential risks posed by C&D debris has spurred the development of regulatory programs to limit unsafe management practices (Clark, Jambeck, & Townsend, 2006).

Information of the type noted above raised the level of legislative, Ohio EPA, and public concerns with the protectiveness of design and operational requirements and the adequacy of monitoring at C&DD landfills in Ohio. U.S. EPA involvement in closure of one landfill in Ohio and numerous complaints from Ohio citizens about the effects of C&DD landfills on their neighborhoods led to an Ohio legislative study committee on the subject and passage of three different Ohio House bills in 2005. The resulting legislative changes to Ohio Revised Code (ORC) Chapter 3714 mandated such requirements as new fees for funding regulatory activities and ground water monitoring; significant restrictions on the locations where C&DD landfills can be sited, prohibiting acceptance of pulverized debris; prohibiting disposal of solid waste; requiring permits, operational plans, hydrogen sulfide contingency plans, compliance disclosures, increased leachate monitoring, increased ground water monitoring; a statewide C&DD information database maintained by Ohio EPA; and an overhaul of Ohio EPA's C&DD disposal rules. The agency published draft regulations in 2006 and received extensive comments from stakeholders and other interested parties

As a result, the Ohio EPA conducted a study to evaluate the hydrogeologic settings and impacts, if any, to ground water by C&DD landfills in Ohio. Ohio EPA evaluated 98 Ohio C&DD landfills. Forty-seven of the 98 landfills had complete data sets making them eligible for further evaluation. Of these 47 landfills, 31 (66 percent) had indications of ground water impact. The parameters indicating ground water impact at these landfills, in order of prevalence, included sulfate, chloride, magnesium, ammonia, sodium, potassium, organic compounds, calcium, bicarbonate, iron, chemical oxygen demand (COD), specific conductance, manganese, total alkalinity, TDS, pH, arsenic, and nitrite (Ohio EPA, 2008).

In addition, Ohio EPA conducted a study to evaluate and understand the nature of Ohio C&DD leachate. In the summer and fall of 2007, staff sampled all of the operating C&DD landfills in Ohio where access to leachate existed (30 landfills).

The evaluation of the results of the 2007 leachate sampling by Ohio EPA is the subject of this report. This report includes a description of the categories of parameters present in the leachate, and quantitative comparisons of the results of the laboratory analyses of the leachate to health based standards and surface water quality standards. This report also includes a comparison of the parameters showing indications of ground water contamination in the Ohio EPA 2008 C&DD ground water study with the 2007 Ohio C&DD leachate data.

Materials and Methods

During the statewide C&DD leachate sampling event in 2007, Ohio EPA collected samples from all of the Ohio C&DD landfills that had a sump, pipe, or tank to draw samples from (See Figure 1). This resulted in 30 landfills being sampled. No attempt was made to obtain samples from the remaining Ohio C&DD landfills since it would have required boring into the disposed debris.

Figure 1. C&DD landfills that were sampled as part for this report

The laboratory had specific collection requirements and supplied the containers. Ohio EPA obtained the samples. Staff followed the standard operating procedures for field sampling used by Ohio EPA. Sample containers were secured with Teflon-lined lids. Samples were stored in ice to maintain the appropriate preservation temperature until they were received by the laboratory.

For every 10 samples taken, one duplicate sample was also taken. At each sampling location, there was ample leachate present to obtain enough volume for samples. When only one sample was taken for the day, no duplicate sample was collected. The log sheets, chains of custody, and data reports contain the duplicate information. Trip blanks went with VOC samples.

Results and Observations

This section is divided into the following parts:

- A summary and evaluation of the parameters that were sampled and analyzed.
- A comparison of the descriptive statistics from the leachate analysis results against health based standards. Health based standards used in this report include the U.S. EPA Maximum Contaminant Levels And Action Levels (MCL) (US EPA, 2006), Ohio EPA, Voluntary Action Program (VAP) Generic Unrestricted Potable Use Standards (proposed OAC Rule 3745-300-08, Tables V and VI), U.S. EPA Lifetime Health Advisory (LTHA) (US EPA, 2006), U.S. EPA Drinking Water Equivalent Level (DWEL) (US EPA, 2006); and the U.S. EPA Secondary Maximum Contaminant Levels (SMCL) (US EPA, 2006).
- A comparison of the descriptive statistics for the leachate analysis results against Ohio surface water quality standards from OAC Chapter 3745-1.
- A comparison of the parameters detected in the C&DD leachate with the constituents showing indications of impact to ground water at Ohio C&DD landfills from the 2008 Ohio EPA study titled "Hydrogeologic evaluation of construction and demolition debris (C&DD) facilities in Ohio.

Labeling of SMCLs as health based standards in this report

The use of health based standards in this report is for the purpose of providing a benchmark to gauge the possible effects that C&DD leachate could have if released to the environment. The use of health based standards in this report is not intended to be used to indicate that the leachate from any given landfill should not exceed those standards and is not intended to indicate that leachate that does exceed those standards is causing harm to public health or the environment. A determination of harm to public health or the environment would require site specific evaluations, analysis, and assessment.

Although U.S. EPA SMCLs are not limits based on toxicity or carcinogenicity, they are included as health based standards in this report because they represent limits for parameters in water that would make the water objectionable for use and to simplify the narrative when discussing the standards. It is understood by Ohio EPA that SMCLs are non-regulatory recommended guidelines that were created due to adverse cosmetic (tooth and skin discoloration) and aesthetic effects (taste, odor, color) (US EPA, 2006). Every attempt has been made to be clear in the tables and narrative when exceedances of what this report terms as "health based standards" are exceedances of SMCLs.

Some ground water can naturally contain parameters that have SMCLs. However, good quality ground water that becomes degraded from human sources could require significant expense on the part of the user of the water to treat the water prior to use to avoid the objectionable effects. Eight parameters (aluminum, sodium, chloride, ammonia, sulfate, pH, TDS, and iron) use SMCLs as the health based standards in this report. The remaining parameters had health based standards derived to protect against adverse toxic or carcinogenic effects that could be used.

Description of the parameters that were sampled and analyzed

Leachate samples were collected from all of the Ohio C&DD landfills that had sampling points, such as pipes, sumps, or tanks available. This resulted in 30 landfills being sampled. The leachate from each landfill was analyzed for 299 parameters. The parameters were selected to provide a wide spectrum of analysis to account for the wide variety of materials that can be disposed in Ohio C&DD landfills. The parameters chosen for analysis also included parameters specified in Ohio statutes and rules. Information about each parameter is in Attachments 2 to 4.

Each metal parameter and trace element parameter had both the total concentration and the dissolved concentration analyzed. All nine of the heavy metals and all seven of the light metals that had total concentrations detected also had dissolved concentrations detected. Eight of the nine trace elements that had total concentrations detected also had dissolved concentrations detected. One trace element, phosphorus, had only total analysis run.

The dissolved heavy metals, dissolved trace elements, and dissolved light metals are not included as parameters in any of the tables, figures, or calculations unless specifically identified. This was done to avoid double counting each metal and trace element.

Chemical oxygen demand (COD), pH, total dissolved solids (TDS), and total alkalinity are being handled separately in this report and are not included in any of the tables, figures, or calculations unless specifically identified.

Of the 299 parameters analyzed, 26 were for dissolved metals and trace elements. This means that the leachate was analyzed for 273 distinct parameters. These 273 parameters will be the focus of this report.

The organic parameters were grouped into the following parameter categories:

- Alcohols
- Chlorinated solvents
- Chlorofluorocarbons
- Gasoline
- Non-chlorinated solvents
- PAHs
- Pesticides
- Phenolics
- Phthalates
- Substituted alkanes
- Substituted benzenes

One organic compound, Bis (2-Chloroethoxy) Methane, was difficult to categorize, so it was labeled as "Other organics".

The metals and inorganic parameters were grouped into the following parameter categories:

- Heavy metals, totals
- Heavy metals, dissolved
- Light metals, totals
- Light metals, dissolved
- Trace elements, totals
- Trace elements, dissolved
- Other ions
- COD
- pH
- TDS
- Total Alkalinity

The term "heavy metals" is poorly defined in the literature, leading some to hold it is a "meaningless term" (Duffus, 2001). Ohio EPA categorized parameters in this document as "heavy metals" if they were generally accepted as being toxic to humans, could not be categorized as micronutrients, and were denser than cobalt. Two exceptions to these criteria were included as heavy metals. The first exception is beryllium, which is toxic but less dense than cobalt. The second exception is arsenic, which is technically a nonmetal or metalloid. Some of the trace elements in this report may be toxic at higher dosages and are sometimes considered heavy metals by regulatory agencies. However, they are also considered micronutrients at low dosages. As a result, they are categorized as trace elements in this report.

Description of the parameters that were detected

Of the 273 parameters analyzed, 95 parameters were detected at one or more C&DD landfill (See Table 1) including COD, pH, TDS, and total alkalinity. Dissolved parameters were not included in the count of parameters in Table 1 so that metals and trace elements would not be counted twice.

Of those 95 parameters:

- 61 percent were organic parameters.
- 23 percent were light metals, trace elements, and other ions.
- 9 percent were heavy metals.
- The remaining percentage was made up of COD, pH, TDS, and total alkalinity.

See Attachment 11 for the descriptive statistics and comparisons for all parameters detected in Ohio C&DD Leachate during the 2007 leachate sampling event. See Attachment 12 for a listing of all of the parameters that were analyzed but not detected during the 2007 leachate sampling event. Two metals (silver and tin) were not detected at any C&DD landfill. Organic compounds comprised the remaining 176 parameters that were not detected.

Table 1. Number of parameters in each parameter category detected at one or more Ohio C&DD landfills

Parameter Category	Number of parameters detected	Percentage (%)
Organic Parameters		
Pesticides	19	20
Chlorinated solvents	11	12
Non-chlorinated solvents	7	7
Gasoline	5	5
Substituted benzenes	5	5
Phenolics	4	4
Chlorofluorocarbons	2	2
PAHs	2	2
Alcohols	1	1
Phthalates	1	1
Substituted alkanes	1	1
Other organics	1	1
Metals and Inorganic Parameters		
Heavy metals	9	9
Light metals	7	7
Trace elements	9	9
Other ions	7	7
COD	1	1
pH	1	1
TDS	1	1
Total Alkalinity	1	1
Total	95	

The parameter categories with the most parameters having detections were pesticides, chlorinated solvents, heavy metals, trace elements, light metals, non-chlorinated solvents, other ions, gasoline, substituted benzenes, and phenolics. Parameter categories with the fewest parameters having detections were chlorofluorocarbons, PAHs, phthalates, substituted alkanes, and alcohols.

Table 2 and Figure 2 show the number of detections that occurred in each parameter category. The most frequently detected parameters in order from most to fewest were trace elements, light metals, other ions, heavy metals, gasoline, chlorinated solvents, pesticides, non-chlorinated solvents, substituted benzenes, PAHs, phenolics, and chlorofluorocarbons accounting for 89 percent of the parameters detected. COD, pH, TDS, and total alkalinity were measured at all of the landfills, which accounts for 10 percent of the detections. The remaining one percent of detections included phthalates, substituted alkanes, alcohols, and one other organic parameter. Also expected was the high detection frequency of trace elements, light metals, other ions, and heavy metals.

What was unexpected was the high detection frequency of gasoline, chlorinated solvents, pesticides and non-chlorinated solvents.

The pesticides detected included both herbicides and insecticides. Pesticides usually adhere to soil particles or the materials they were applied to such as wood, carpeting, and textiles. Pesticides are often low in solubility and have relatively low mobility; yet 19 different pesticides accounted for 68 detections and were detected at numerous landfills. This may indicate that the quantity of pesticides in the disposed C&DD is quite large.

Table 2. Number of detections in each parameter category at Ohio C&DD landfills

Parameter Category	Number of Detections	Percentage (%)
Organic Parameters		
Gasoline	94	8.1
Chlorinated solvents	81	7.0
Pesticides	68	5.9
Non-chlorinated solvents	60	5.2
Substituted benzenes	23	2.0
PAHs	22	1.9
Phenolics	9	0.8
Chlorofluorocarbons	8	0.7
Phthalates	4	0.3
Substituted alkanes	4	0.3
Alcohols	2	0.2
Other organics	1	0.1
Metals and Inorganic Parameters		
Heavy metals	138	11.9
Light metals	181	15.6
Trace elements	185	15.9
Other ions	161	13.9
COD	30	2.6
pH	30	2.6
TDS	30	2.6
Total Alkalinity	30	2.6
Total Detections	1161	

The counts for dissolved parameters for 24 metals and trace elements were not shown in Table 2 or Figure 2 so that the metals and trace elements would not be counted twice.

The high number of detections for gasoline may be from fuel spills from equipment and storage containers during construction and demolition activities. It could also be coming from petroleum contaminated soils, which are often not regulated as waste by Ohio, but are used as operational cover at Ohio C&DD landfills.

Table 3 shows the 59 organic parameters grouped by parameter category that were detected in leachate at one or more Ohio C&DD landfills. Highlighted parameters in Table 3 were also listed as detected in the study, "Construction and Demolition Waste Landfills" (US EPA, Draft 1995a)

Table 4 shows the 36 metals and inorganic parameters grouped by parameter category that were detected in leachate at one or more Ohio C&DD landfills. For completeness, pH, COD, TDS and total alkalinity are also shown. Highlighted parameters in Table 4 were also listed as detected in the study, "Construction and Demolition Waste Landfills" (US EPA, Draft 1995a).

Chemical Oxygen Demand	COD
pH	pH
Total Dissolved Solids	TDS
Total Alkalinity	Total Alkalinity

*Highlighted parameters were also listed as detected in the study, "Construction and Demolition Waste Landfills" (US EPA, Draft 1995a).

Based on historical information, such as the sources cited in the introduction (see especially (US EPA, Draft 1995a)), it was expected that approximately 90 parameters would be detected; 95 were detected. It was also expected that metals and inorganic parameters would be the primary constituents detected in Ohio's C&DD leachate; with approximately 55 of the 90 parameters being metals and inorganic compounds. However, the results from Ohio EPA's leachate analysis provided the surprising result that only 36 metals and inorganic parameters were detected, which was lower than expected. It was also expected that approximately 35 organic parameters would be detected in Ohio's C&DD leachate. However, what was found was that 59 organic parameters were detected. There were a wide variety of organic parameters detected. It was surprising that pesticides, chlorinated solvents and non-chlorinated solvents would be such a large proportion (40 percent) of parameters detected when compared with the proportion of metals and inorganic parameters detected (38 percent).

Evaluation of pH, Total Alkalinity, TDS, and COD

pH

The pH of Ohio C&DD leachate ranges from 6.6 standard units (S.U.) to 7.94 S.U. with a mean measurement of 7.1 S.U. The 95 percent confidence limits for the mean shows that the mean is expected to be from 7.0 S.U. to 7.3 S.U. Iron Valley C&DD landfill and TWL - Penn Ohio C&DD landfill each had a pH measurement (7.71 and 7.94 S.U., respectively) that was a high outlier when compared with the other C&DD landfills (See Figure 3).

For two of the landfills that had multiple samples measured for pH (Summit C&D Disposal, Inc. and TWL-Penn Ohio), each had one result for pH recorded at 9.04 S.U. This value is extreme

when compared with the pH measurements of the other landfills and with the other pH measurement taken at each of those two landfills. It is also unusual that both landfills would have exactly the same extreme pH. It is suspected that field measurement bias resulted in the two anomalous pH readings. They were, therefore, excluded from the tables and calculations in this Ohio EPA study. If additional sampling confirms the high pH values, then the understanding of the pH of Ohio C&DD leachate will need to be revised.

C&DD landfills that dispose large amounts of concrete and cement debris may tend to have higher pH. Landfills that dispose a broad mixture of C&DD may tend to have near neutral pH. Landfills that dispose large amounts of wood and cardboard may tend to be more acidic (Townsend, Jang, & Thurn, 1999). The variation of pH across the Ohio C&DD landfills may be reflective of the differences in the types of C&DD that were disposed. Dilution from ground water infiltration, surface water, and precipitation may also have an effect on the pH from landfill to landfill.

Total Alkalinity

The total alkalinity of Ohio C&DD leachate ranges from 145 mg/L to 3750 mg/L with a mean concentration of 1692 mg/L. The 95 percent confidence limits for the mean shows that the mean is expected to be from 1400 mg/L to 1885 mg/L. Springfield C&DD landfill had the lowest total alkalinity measured at 145 mg/l. This value is a low outlier when compared with the concentrations at the rest of the C&DD landfills. TWL – LAS had the highest total alkalinity measured at 3750 mg/L. This value is a high outlier when compared with the concentrations of the rest of the C&DD landfills. The total alkalinity at all of the remaining 28 landfills ranges from 502 mg/L to 2970 mg/L (See Figure 4). The low measurements of total alkalinity at Springfield C&DD landfill may be the result of dilution by ground water infiltration, surface water, or precipitation. Springfield C&DD landfill also had lower concentrations of other parameters and fewer parameters that exceeded standards when compared with the other 29 landfills; this supports the possibility that dilution affected the concentrations of the parameters in the leachate at this landfill. The other 29 Ohio C&DD landfills show a range for total alkalinity expected (Townsend, Jang, & Thurn, 1999).

TDS

The TDS of Ohio C&DD leachate ranges from 634 mg/L to 7040 mg/L with a mean concentration of 3055 mg/L. The 95 percent confidence limits for the mean shows that the mean is expected to be from 2562 mg/L to 3549 mg/L. TWL – LAS C&DD landfill and RKDF C&DD landfill had the highest TDS measured at 7040 mg/L and 6990 mg/L, respectively. Those values are high outliers when compared with the other C&DD landfills. The maximum TDS of leachate measured at the other 28 landfills is 5460 mg/L (See Figure 5). These 28 Ohio C&DD landfills show a range for TDS that would be expected (Townsend, Jang, & Thurn, 1999). It is unknown why the TDS at TWL – LAS and RKDF would be higher than expected. It is possible that these two landfills have less dilution due to ground water infiltration, surface water run-on, and precipitation than the other landfills or it may be reflective of the type of debris being disposed.

COD

The COD of Ohio C&DD leachate ranges from 50.1 mg/L to 4390 mg/L with a mean concentration of 826 mg/L. The 95 percent confidence limits for the mean shows that the mean is expected to be from 501 mg/L to 1151 mg/L. RKDF and TWL – LAS had the highest

measured COD at 4390 mg/L and 4320 mg/L, respectively. These values are extreme when compared with the COD measurements of the other landfills. The maximum COD measurement of leachate at the remaining 28 landfills is 1560 mg/L (See Figure 6). The range of COD measurements at Ohio C&DD landfills falls in a range similar to what would be expected of C&DD leachate (Townsend, Jang, & Thurn, 1999). It is unknown why the COD measurements at RKDF and TWL-LAS are higher than the remaining 28 landfills. The TDS concentrations are higher at these two landfills also and these two landfills were among the landfills with a higher number of parameters that exceeded standards. This may support the theory that less dilution is occurring at these two landfills or that the type of debris being disposed is different.

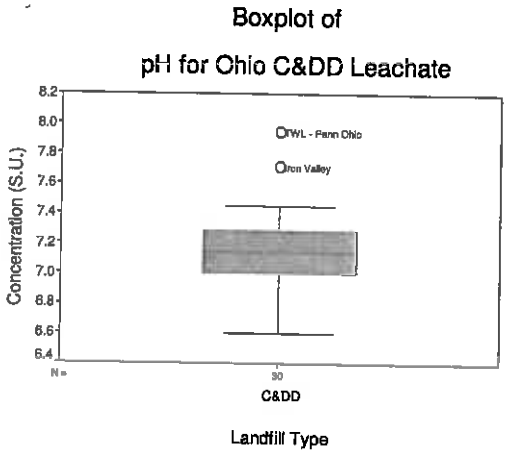

Figure 3. Boxplot of pH measurements for Ohio C&DD leachate

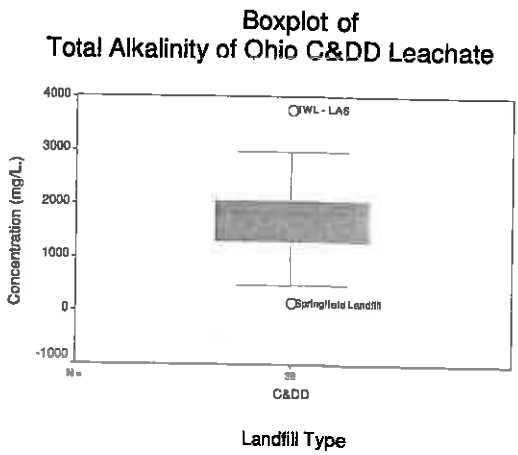

Figure 4. Boxplot of Total Alkalinity measurements for Ohio C&DD leachate

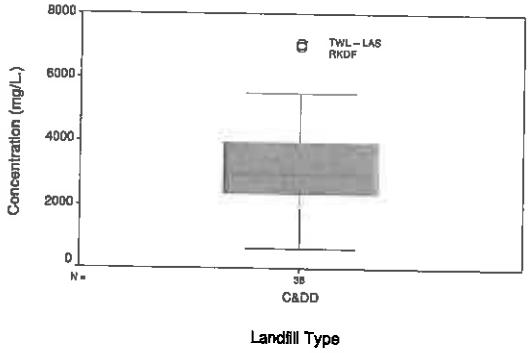

Figure 5. Boxplot of TDS measurements of Ohio C&DD leachate

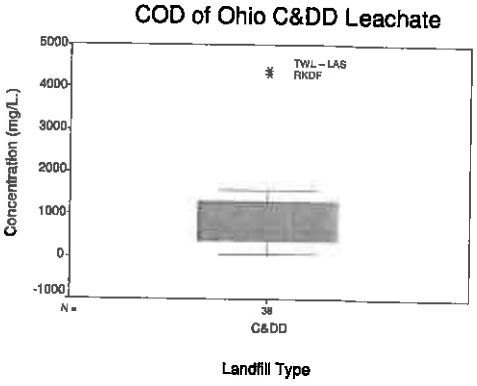

Figure 6. Boxplot of COD measurements of Ohio C&DD leachate

Notes for Figure 3 to Figure 6

o = value is an outlier compared with other landfills (an outlier concentration has a value from 1.5 to 3 box lengths from the upper or lower edge of the box. The box length is the interquartile range).

* = extreme value compared with other landfills (an extreme concentration has a value more than 3 box lengths from the upper or lower edge of the box. The box length is the interquartile range).

With a few exceptions, the measurements of pH, TDS, COD, and total alkalinity from Ohio C&DD leachate are similar to the findings in the literature for leachate from C&DD landfills in other states as described in the sources summarized in the introduction.

Evaluation of major cations and anions

Figure 7 shows a Piper diagram of the leachate analysis results for the 30 Ohio C&DD landfills. The Piper diagram displays the ratios of major anions and cations in the leachate and is useful for understanding similarities and differences between the leachate from landfill to landfill. Bicarbonate was not a parameter used by Ohio EPA during this sampling event. The following formula was used to convert the total alkalinity results to bicarbonate equivalents for the purposes of constructing the Piper diagram.

BICARBONATE (HCO_3) = TOT ALK/0.82 (Hem, 1985, reprinted 1992)

Cation Proportions

Figure 7 shows that there was no dominant type of major cation for C&DD leachate. This means the sodium plus potassium, magnesium, and calcium cations were of similar proportions in the leachate at each of the landfills. Three exceptions exist that include four landfills. The exceptions are marked A, B, and C on Figure 7.

Exception A is the James Bros. C&D landfill (ID 33488), which has a higher proportion of calcium than the other C&DD landfills.

Exception B is Ohio Demo (BFI C&D) landfill (ID 26919), which has a higher proportion of magnesium than the other C&DD landfills.

Exception C includes two landfills that had a higher proportion of sodium plus potassium than the other C&DD landfills. The two landfills are Frank Road (AGG ROK Demo LF) (ID 230321) and RKDF (ID 54266).

Anion Proportions

Figure 7 shows Ohio C&DD landfill leachate has a higher proportion of bicarbonate than chloride or sulfate. Two exceptions exist that include four landfills. The exceptions are marked D and E on Figure 7.

Exception D includes three landfills that had a higher proportion of sulfate than the other Ohio C&DD landfills. The three landfills that had leachate that were proportionately higher in sulfate are: RKDF (ID 54266), TWL – Penn Ohio C&DD landfill (ID 145884), and Springfield C&DD landfill LLC (Ron's Demolition) (ID 54297).

Exception E is the Boyas Excavating, Inc. C&DD landfill (ID 54264), which has no anions with a dominant proportion. This landfill has higher proportions of chloride and sulfate compared with the other C&DD landfills, but the sulfate was not as high as the landfills in Exception D.

Frank Road C&DD landfill (ID 230321) has a higher proportion of chloride than any other C&DD landfill. However, the proportion of chloride was not high enough to be considered dominant, so it was still considered as having a bicarbonate dominant leachate.

Cation-Anion Proportions

The diamond shaped portion of Figure 7 shows the plot of the cation proportions and the anion proportions together for the Ohio C&DD landfills sampled for this report. Ohio C&DD landfills had a higher proportion of calcium plus magnesium and bicarbonate in their leachate than sodium plus potassium, chloride, and sulfate. Five of the seven landfills that are exceptions in the cations or anions portions of Figure 7 are also exceptions on this part of the graph.

Exception F includes three landfills that had sulfate as higher proportion and bicarbonate in a lower proportion in their leachate than the other C&DD landfills. The three landfills in this exception are: TWL – Penn Ohio C&DD landfill (ID 145884), Springfield C&DD landfill LLC (Ron's Demolition) (ID 54297) and the Boyas Excavating, Inc. C&DD landfill (ID 54264). It can be seen on this plot that Springfield C&DD landfill LLC also has a higher proportion of calcium plus magnesium than almost all of the other C&DD landfills.

Exception G is RKDF (ID 54266), which has a higher proportion of sulfate and sodium plus potassium than the other C&DD landfills. This landfill also has a lower proportion of calcium plus magnesium and bicarbonate than the other C&DD landfills.

Exception H is Frank Road (AGG ROK Demo LF) (ID 230321), which has higher sodium plus potassium, and was among the landfills with a lower proportion of bicarbonate than the majority of the other C&DD landfills.

Figure 7. Piper diagram showing the distribution of major ions in Ohio C&DD leachate

The dominant anion in Ohio C&DD leachate was bicarbonate. There was no dominant cation, though calcium and magnesium tended to be higher in proportion of major cations in Ohio C&DD leachate. Sulfate was the dominant anion at three landfills, with one additional landfill having sulfate higher than the other landfills, but not high enough in proportion to the other anions to be considered dominant. Chloride typically made up less than 20 percent of the major anions in Ohio C&DD leachate. Sodium and potassium were the dominant cations at two landfills.

Since the majority of the C&DD landfills plot in only one quadrant of each section of the Piper diagram, Piper diagrams may prove useful when comparing C&DD leachate with leachate from other types of landfills, ground water, and surface water. However, seven of the landfills (1/4) do not fit the typical profile of C&DD leachate demonstrated by the other 23 landfills. This shows that there was wide variability from landfill to landfill in the proportions of the major ions in leachate.

The differences in the proportions of major cations and anions identified as A through H in Figure 7 could be the result of dilution by ground water infiltration, precipitation, and surface water run-on. Other reasons for the differences could be the type of materials disposed in the landfill, the presence or absence of leachate recirculation, the amount of compaction and size reduction the disposed material undergoes as it is being disposed; the amount and type of cover used; or the amount, depth, and age of the disposed materials. Without further study, Ohio EPA cannot draw a conclusion as to which, if any, of these reasons account for the differences.

Comparison against health based standards

Health based standards used in this report were applied to each parameter in the following order:

- U.S. EPA Maximum Contaminant Levels or Action Levels (MCL).

  The U.S. EPA MCLs are the highest level of a contaminant that is allowed in drinking water (US EPA, 2006).

- Ohio EPA, Voluntary Action Program (VAP) Generic Unrestricted Potable Use Standards (GUPUS) (proposed OAC Rule 3745-300-08, Tables V and VI).

  The Ohio EPA, VAP, GUPUS contained in Table V and Table VI of proposed OAC Rule 3745-300-08 were determined using the assumption that the ground water on, underlying and emanating from the property will be used as a source of water for drinking, cooking, showering and bathing.

- U.S. EPA Lifetime Health Advisory (LTHA).

  U.S. EPA LTHAs are the concentration of a chemical in drinking water that is not expected to cause any adverse non-carcinogenic effects for a lifetime of exposure. The LTHAs are based on exposure of a 70-kg adult consuming two liters of water per day. Where appropriate, U.S. EPA has made adjustments to the LTHA for certain types of possible carcinogens (US EPA, 2006).

- U.S. EPA Drinking Water Equivalent Level (DWEL).

  U.S. EPA DWELs are the lifetime exposure concentrations protective of adverse, non-cancer health effects that assumes all of the exposure to a contaminant is from drinking water (US EPA, 2006).

- U.S. EPA Secondary Maximum Contaminant Levels (SMCL).[1]

  U.S. EPA SMCLs are non-enforceable federal guidelines regarding cosmetic effects (such as tooth or skin discoloration) or aesthetic effects (such as taste, odor, or color) of drinking water (US EPA, 2006).

Eight parameters (aluminum, sodium, chloride, ammonia, sulfate, pH, TDS, and iron) had SMCLs assigned. The remaining parameters had health based standards that could be used that were derived to protect against adverse toxic or carcinogenic effects.

Seventeen of the parameters detected did not have a health based standard to be assigned.

Ninety five parameters were detected in Ohio C&DD leachate. Of the 95 parameters that were detected, 78 parameters had health based standards assigned. Fifty of the 78 parameters that have health based standards (64 percent[2]) were below the standards and 28 of the parameters (36 percent) exceeded the standards at one or more landfill.

Table 5 and Figure 8 show the number of parameters that exceeded a health based standard in each parameter category at one or more landfill. There were 28 parameters that exceeded the health based standards (excluding dissolved heavy metals, dissolved trace elements, and dissolved light metals). Twenty one parameters exceeded health based standards determined by toxicity or carcinogenicity. The remaining seven parameters exceeded standards based on SMCLs.

Heavy metals account for 8 of the exceedances (29 percent); light metals, trace elements, and other ions account for 11 of the exceedances (39 percent); and organic parameters account for 8 of the exceedances (29 percent). TDS accounts for the remaining percentage.
The exceedances of health based standards at Ohio C&DD landfills occurred mainly due to heavy metals, light metals, trace elements, other ions, chlorinated solvents, and pesticides, with one parameter exceeding the health based standards from the categories of gasoline, PAHs, phenolics, and phthalates. TDS also exceeded the health based standard.

Seven of the parameters that exceeded the standards were aluminum, chloride, iron, ammonia, sodium, sulfate, and TDS. The standards for these parameters are SMCLs[1].

There were 12 metals and trace elements with results for dissolved concentrations that exceeded the health based standards that also had total concentration results that exceeded health based standards. To avoid double counting parameters that had both dissolved and total concentration results, the dissolved results were not counted in Table 5 or shown in Figure 8. Total cadmium was detected at two landfills and did not exceed the health based standard (it was 57 percent and 91 percent of the standard). Dissolved cadmium was detected at one landfill and did exceed the health based standard (1.17 times). This was the only heavy metal where the total concentrations measured did not exceed the standard but a dissolved concentration did. It is unusual for a dissolved concentration of a metal to be higher than the total concentration in a sample. So, some questions arise about the validity of the dissolved cadmium result. However, the literature indicates that cadmium has been identified as a parameter of concern at C&DD landfills (US EPA, Draft 1995a), (Townsend, Jambeck, & Clark, 2002), (Clark, Jambeck, & Townsend, 2006).

Because cadmium has been identified in the literature as a parameter of concern at C&DD landfills and because it was detected at 10 percent of the C&DD landfills sampled by Ohio EPA,

[1] See Labeling of SMCLs as health based standards in this report on page 13 for more information.
[2] All percentages are rounded to the nearest integer.

cadmium was included, for the purpose of discussion, in the list of heavy metals that exceeded the health based standards in Table 5, shown in Figure 8, and other figures and tables throughout the report. For clarity, cadmium is called out each time it is included in totals or subtotals of figures, tables, or in the narrative.

However, due to the questions regarding the unusual occurrence of a dissolved concentration being higher than totals concentrations, cadmium was ultimately categorized as a noteworthy parameter, rather than a parameter with a high level of concern or a parameter with a moderate level of concern (See Table 8. Parameters of concern in Ohio C&DD leachate when compared with health based standards.

Table 5. Number of parameters in each parameter category that exceeded health based standards at one or more Ohio C&DD landfills.

Parameter Category	Number of parameters that exceeded a HB Standard	Percentage (%)

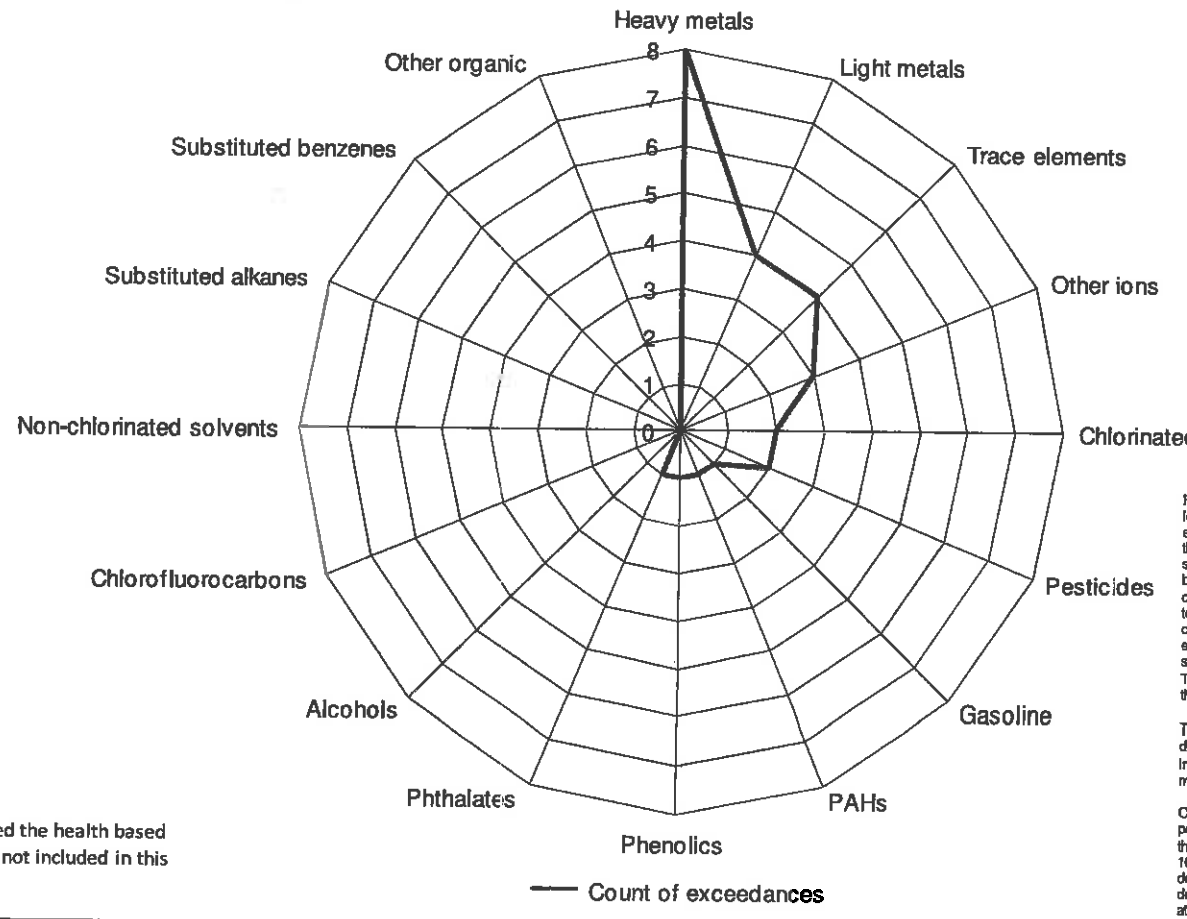
Light metals	4	14
Trace elements	4	14
Other ions	3	11
TDS	1	4
Total	28	

The pesticide, MCPA, and dissolved cadmium which exceeded the standard included in Table 5 were detected at one landfill (total cadmium was detected at two landfills though it was detected at 91 percent of the standard). All the other parameters were detected at three or more C&DD landfills.

Not shown in Table 5 are one additional parameter in the category "other ion" (fluoride), one additional pesticide, (disulfoton), and pH that were 70 percent to 100 percent of the health based standards. Fluoride was detected at all C&DD landfills, disulfoton was detected at one C&DD landfill, and pH was measured at all C&DD landfills.

Number of leachate Parameters that Exceed Health Based Standards at One or More C&DD Landfills

Sorted by Parameter Categories with Most to Fewest Parameters Exceeding



TDS also exceeded the health based standards but is not included in this figure.

Five dissolved heavy metals, (antimony, arsenic, lead, nickel, thallium), Four dissolved trace elements (boron, chromium, iron, manganese) and three dissolved light metals (aluminum, sodium, strontium) also exceeded health based standards but are not included in this figure to avoid double counting parameters that had both dissolved and total concentration results. The exception is for cadmium, where the totals concentrations did not exceed the HB standards (it was 91% of the HB standard) but the dissolved concentration did. Therefore, cadmium was counted as a heavy metal that exceeded the HB standard.

The pesticide, MCPA, included in this figure was detected at one landfill. All other parameters included in this figure were detected at three or more landfills.

One additional anion (fluoride), one additional pesticide, (disulfoton), and pH were not included in this figure, but were detected between 70% and 100% of the health based standards. Fluoride was detected at all C&DD landfills disulfoton was detected at one C&DD landfill, pH was measured at all of the C&DD landfills.

Figure 8. Number of parameters in each parameter category that exceeded health based standards sorted by parameter categories with the most to fewest parameters exceeding.

Table 6 shows the list of 59 organic parameters sorted by parameter category that were detected in C&DD leachate. Eight parameters, methylene chloride, vinyl chloride, benzene, naphthalene, MCPA, pentachlorophenol, 3-,4-methylphenol, bis(2-ethylhexyl) phthalate, are highlighted in Table 6 because they exceeded health based standards at one or more landfill.

Table 7 shows the 60 metals and inorganic parameters sorted by parameter category that were detected in C&DD leachate. The 20 parameters that exceeded health based standards at one or more landfill, antimony, arsenic, barium, beryllium, lead, nickel, thallium, aluminum, sodium, strontium, vanadium, chloride, ammonia, sulfate, boron, chromium, iron, manganese, TDS, and dissolved cadmium, are highlighted in Table 7. The other dissolved parameters are also included in the table and highlighted so that it is clear which totals parameters and which dissolved parameters exceeded the health based standard.

Table 8 shows the parameters in Ohio C&DD leachate that are of concern due to exceedances of health based standards. The level of concern for a parameter was determined by evaluating:

- The number of landfills where it was detected.
- The type of health based standard that was exceeded (SMCL[3] vs. a health based standard derived to protect against toxic or carcinogenic effects).
- The magnitude of exceedance of a health based standard for the minimum, maximum, mean, and median concentrations.
- Whether either of the confidence limits of the mean exceeded the health based standard

[3] (See Labeling of SMCLs as health based standards in this report on page 13 for more information).

There is a high level of concern for nine parameters, including one chlorinated solvent (vinyl chloride), one gasoline component (benzene), two heavy metals (arsenic and lead), one light metal (strontium), one phenolic (3-,4-methylphenol), one phthalate (bis(2-ethylhexyl)phthalate), and two trace elements (boron and manganese).

These parameters were detected at multiple C&DD landfills and frequently exceeded health based standards. The health based standard exceeded was for protecting against toxic or carcinogenic effects. The magnitude of the exceedances were large, with maximum concentrations detected from 2.3 times (strontium) to 80 times (bis(2-ethylhexyl)phthalate) the health based standards.

Two parameters (3-,4-methylphenol and bis(2-Ethylhexyl)phthalate), were assigned a high level of concern even though they were detected less frequently because when detected they were likely to exceed the health based standards.

Based on the median concentrations measured, the leachate at half or more of the Ohio C&DD landfills exceeded the health based standards for:

- Manganese by at least 6 times.
- Boron by at least 10 times.
- Arsenic by at least 4 times.

Based on the upper and lower confidence limits of the mean, during future leachate sampling, the mean concentrations across all of the Ohio C&DD landfills of manganese, boron, arsenic, and strontium are expected to be:

- 5 to 9 times the health based standard for manganese.
- 8 to 12 times the health based standard for boron.
- 3 to 7 times the health based standard for arsenic.
- 71 percent to 96 percent of the health based standard for strontium.

Excepting three parameters, all of the parameters assigned a high level of concern had mean concentrations that exceeded the health based standards from 1.03 times (lead) to 10.12 times (boron).

Excepting two parameters, all of the parameters assigned a high level of concern had upper confidence limits of the mean that exceeded the health based standard from 1.25 times (benzene) to 12.35 times (boron).

Of the three parameters that were assigned a high level of concern even though they had mean concentrations that did not exceed the standard:

- Vinyl chloride was assigned a high level of concern because it:
  - Is a known carcinogen.
  - Is mobile in the environment.
  - Is indicative of chlorinated solvents being present in the disposed debris.
  - Was detected at 43 percent of the C&DD landfills.
  - Had a maximum concentration detected of 3.5 times the health based standard.

- Benzene was assigned a high level of concern because it:
    - Is a known carcinogen.
    - Was detected at 80 percent of the C&DD landfills.
    - Had a maximum concentration detected that was 9 times the health based standard.
    - Had an upper confidence limit of the mean that was 1.25 times the health based standard.

- Strontium was assigned a high level of concern because it:
    - Was detected at 100 percent of the C&DD landfills.
    - Had a maximum concentration detected that was 2.3 times higher than the health based standard.
    - Had mean and median concentrations at 80 percent of the health based standard or higher.
    - Is likely that the mean concentration measured across all C&DD landfills during future leachate sampling would be greater than 70 percent of the health based standard and may be as high as the standard itself.

There is a moderate level of concern for 10 parameters, including one chlorinated solvent (methylene chloride), five heavy metals (antimony, barium, beryllium, nickel, thallium), one light metal (vanadium), one PAH (naphthalene), one pesticide (pentachlorophenol) and one trace element (chromium). These parameters were determined to be of moderate concern because:

- Less than 50 percent of the landfills sampled exceeded the standard for these parameters.

- Based on the upper and lower confidence limits the mean concentration across all of Ohio's C&DD landfills would be expected to be less than 60 percent of the standard for each of these parameters, except methylene chloride, which has an upper confidence limit of 99 percent of the health based standard.

  Methylene chloride could have been assigned a high level of concern because it has toxic effects and is a suspected carcinogen. However it was assigned a moderate level of concern even though the maximum detected concentration was more than 16 times the standard and the upper confidence limit was 99 percent of the standard because the parameter was detected at seven landfills and exceeded the standard at only two landfills. If additional sampling shows that methylene chloride is detected more frequently, or exceeds the health based standard at more landfills, it is recommended that the level of concern be raised to "high."

- None of the parameters had minimum detected concentrations that exceeded a standard.

- However, the maximum concentrations detected of these parameters exceeded the health based standard from 1.15 times (naphthalene) to 16.44 times (methylene chloride).

Aluminum, chloride, iron, ammonia, sodium, sulfate, and TDS were determined to be noteworthy because they exceeded SMCLs[4] and are likely to exceed the SMCLs during future leachate sampling at C&DD landfills. For these parameters:

- They were detected at 70 percent or more of the landfills.
- With the exception of ammonia, half or more of the landfills exceeded the SMCLs by 1.2 times (chloride) to 30.9 times (iron).
- With the exception of ammonia, the mean concentrations for all ranged from 1.4 times (chloride) to 79 times (iron) the SMCL. The mean concentration for ammonia was 82 percent of the SMCL.
- The maximum concentrations detected exceeded the SMCLs from 3.1 times (ammonia) to 2,323 times (iron).
- Based on the lower and upper confidence limits, the mean concentrations across all of Ohio C&DD landfills during future leachate sampling for chloride, iron, sodium and TDS would be expected to exceed the SMCLs.
- TDS exceeded the SMCL at all C&DD landfills by at least 1.3 times.

Other noteworthy parameters include: pH, cadmium, fluoride, and the pesticides, MCPA and disulfoton either because they were found in all C&DD landfill leachate samples and exceeded 70 percent of the health based standards or were infrequently found but exceeded 100 percent of the health based standards.

For pH, the maximum detected pH was 93 percent of the SMCL for maximum pH. The minimum detected pH was 98 percent of the SMCL for minimum pH. This is noteworthy because it shows that the pH of C&DD leachate runs from the minimum standard to the maximum standard; and because pH affects leachability, the ease of migration of some parameters in the environment, and the toxicity of some metals.

The insecticide, MCPA, was considered noteworthy because, even though it was detected at only one C&DD landfill, it exceeded the health based standard by 11.2 times.

Cadmium, fluoride, and disulfoton were considered noteworthy because they were detected at concentrations above 70 percent of the health based standards. Total cadmium was detected at two landfills and dissolved cadmium exceeded the health based standard at one landfill. Fluoride was detected at all 30 landfills and the maximum detected was 84 percent of the health based standard. The insecticide, disulfoton, was detected at one landfill and the detection was 74 percent of the health based standard.

[4] (See Labeling of SMCLs as health based standards in this report on page 13 for more information).

*At one landfill, dissolved cadmium exceeded the health based standard (by 1.2 times).

Table 9 shows the individual parameter information (columns 1 – 5), descriptive statistics (columns 6 – 12), and the results of the comparisons of the minimum detected, maximum detected, mean, and 95 percent confidence limits for each parameter with the health based standards (columns 13 – 20). The parameters are grouped by parameter category.

To calculate the mean concentration and the 95 percent confidence limits in Table 9, non-detects at the method detection limit were set equal to zero and estimated lab values were included in the calculation. This may have resulted in the mean concentrations being slightly lower than if analytical methods with lower method detection limits had been used.

Seven C&DD landfills had more than one sample analyzed. To ensure that the data from all of the landfills carried equal weight when making comparisons with health based standards, the results for each landfill that had more than one sample analyzed were adjusted. The adjustment that was made was to average the concentration values for each parameter for each of the seven landfills.

Some objections to this adjustment may be raised. These include, possibly having the effect of diluting the representation of the concentrations of those parameters for those landfills in the calculation of the overall mean across all landfills, lowering the upper confidence limit since the standard error of the mean could possibly be reduced because the influence of the higher maximum values was muted for those landfills, and increasing the lower confidence limit because the standard error of the mean might be reduced because of the muted influence of the lowest values for those landfills.

However, the maximum concentrations measured for each parameter across all of the landfills are also compared against the health based standards and the surface water quality standards. Doing this provides the appropriate information for this report and mitigates the possibly muted results that may have occurred for a few parameters, while at the same time providing the benefit that the seven landfills that had multiple samples analyzed would not skew the results. See Attachment 12 for a detailed discussion of this issue.

In Table 9, the minimum detected column (Column 7) is the minimum concentration measured above the method detection limit at any one landfill. The maximum detected column (Column 8) is the maximum concentration detected at any one landfill.

Columns 13 through 20 in Table 9 show the health based standards and the results of the comparisons of the descriptive statistics with those standards. The darker highlights identify comparisons that show exceedances of the health based standards. The lighter highlights identify comparisons that show results 70 percent to 100 percent of the health based standard.

The results of the comparison of the descriptive statistics to the health based standards in columns 15 through 20 of Table 9 were calculated by taking the ratio of the descriptive statistic to the health based standard. This means if a number is equal to or greater than 1.0, it can be read as the number of times the parameter exceeds the health based standard; if the number is less than 1.0 and is multiplied by 100, it can be read as the parameter being a percentage of the health based standard.

As used in Table 9 the health based standards include:

- MCL = US EPA Maximum Contaminant Level or Action Level
- VAP = Ohio EPA, Voluntary Action Program Generic Unrestricted Potable Use Standard
- LTHA = US EPA Lifetime Threshold Health Advisory
- DWEL = US EPA Drinking Water Equivalence Level
- SMCL = US EPA Secondary MCL[5]

Table 9 includes both the dissolved and total concentration results for the metals and trace elements so that the descriptive statistics and comparisons with the health based standards can be seen for both types of parameters. Table 5 does not count 12 of the dissolved[6] concentration results for metals and trace elements. That is why Table 9 contains information for 40 parameters that exceeded the health based standards and Table 5 includes a total count of 28 parameters that exceeded the health based standards.

---

[5] (See Labeling of SMCLs as health based standards in this report on page 13 for more information).

[6] The 13th dissolved metal, cadmium, is counted in Table 5 as a heavy metal for the reasons discussed in the narrative found immediately above Table 5.

The 12 dissolved parameters that are shown in Table 9 but not counted in Table 5 are as follows:

- Five heavy metals (antimony, arsenic, lead, nickel, thallium).
- Four trace elements (boron, chromium, iron, manganese).
- Three light metals (aluminum, sodium, strontium).

Parameters that are also shown in Table 9, but are not counted in Table 5 because they had concentrations between 70 percent and 100 percent of the health based standards are the parameter in the category "other ion", fluoride, the pesticide, disulfoton, and pH. Fluoride was detected at all C&DD landfills, disulfoton was detected at one C&DD landfill and pH was measured at all of the C&DD landfills. These three parameters were included in Table 9 for completeness because they were discussed as noteworthy parameters previously.

Methylene chloride is a common lab contaminant. Sufficient concentrations of methylene chloride were found in trip blanks for two of the samples (Rosby Resource C&DD landfill and Silver Oak C&DD landfill) to cast doubt on the validity of the methylene chloride results for those samples. Therefore, the suspect sample results were removed from the data set used to produce this summary.

For two landfills that had multiple samples measured for pH (Summit C&D Disposal, Inc. and TWL-Penn Ohio), each had one of the results for pH recorded at 9.04 S.U. This value is extreme when compared with the pH measurements of the other landfills and with the other pH measurement taken at each of those two landfills. It is also unusual that both landfills would have exactly the same extreme pH. It is suspected that field measurement bias resulted in the two anomalous pH readings. They were, therefore, excluded from the tables and calculations in this Ohio EPA study. If additional sampling confirms the high pH values, then the understanding of the pH of Ohio C&DD leachate will need to be revised.

Table 9. Statistics for Ohio C&DD leachate parameters that exceeded health based standards and also showing parameters that were 70% to 100% of the standards.

44	36	30	pH	pH[D]	none-8	S.U.	6.6	7.94	7.147556	7.14	7.039762	7.25533	6.5-8.5	SMCL	0.98	0.93				

Note A - For the purpose of calculating descriptive statistics in this table, non-detects at the method detection limit were set equal to zero and lab estimated values were included in the calculation. Because of this, minimum and median concentrations showing zero concentration value cannot be interpreted as "not present," but should be interpreted as "concentration is less than the method detection limit."

Note B - Non-detects below the method detection limit are not included in the minimum detected columns.

Note C - Methylene chloride is a common lab contaminant. Sufficient levels were found in trip blanks for two samples to cast doubt on the validity of the methylene chloride results for those samples. As a result, the suspect sample results were removed from the data set used to produce this summary.

Note D - For pH, two landfills had two suspect identical values that were extremely high compared to other pH measurements at the same facility and the pH of leachate at other C&DD landfills. The two anomalous pH measurements may possibly be from sampling bias in the field. These two landfills had two measurements for pH each. The descriptive statistics for pH were calculated excluding the two suspect high values, but included the other two values. Column 15 is calculated by dividing the minimum pH standard of 6.5 by the minimum pH measured at any one landfill . Column 16 is calculated by taking the maximum pH measured and dividing it by the maximum health based pH standard of 8.5.

Note E - MCL = US EPA Maximum Contaminant Level or Action Level; SMCL = US EPA Secondary MCL; VAP = Ohio EPA, Voluntary Action Program Generic Unrestricted Potable Use Standard; LTHA = US EPA Lifetime Threshold Health Advisory

Note G - Multiple samples were taken from seven C&DD landfills. To prevent those seven landfills from skewing the results for mean, median, and confidence limits, the results for each parameter at each landfill that had multiple samples were averaged and used as a single data point in the calculations.

All 30 C&DD landfills had from 1 to 12 parameters with concentrations that exceeded health based standards for toxicity and carcinogenicity. If parameters that exceeded SMCLs are added all 30 C&DD landfills had from 3 to 19 parameters with concentrations that exceeded health based standards. The median was 4 parameters exceeding the health based standards for toxicity or carcinogenicity. The median was 9 parameters exceeding if SMCLs are added (See Figure 9).

The leachate from 25 of the C&DD landfills had 3 or more parameters that exceeded health based standards for toxicity or carcinogenicity. When parameters that exceeded SMCLs are added, 29 landfills had five or more parameters that exceeded health based standards.

The top five landfills with the most parameters that exceeded health based standards are:

- Warren Recycling C&DD landfill with 12 (19 when parameters with SMCLs are added)
- TWL – LAS C&DD landfill with 10 (17 when parameters with SMCLs are added)
- Fallsburg Road C&DD landfill with 9 (14 when parameters with SMCLs are added)
- RKDF C&DD landfill with 8 (14 when parameters with SMCLs are added)
- C&D Disposal Tech landfill with 7 (14 when parameters with SMCLs are added)

There were from one to six additional parameters at each landfill that were 70 percent to 100 percent of the health based standards

It is known that some of the C&DD landfills have ground water infiltration, and the cover used for C&DD during operations and the C&DD itself has a relatively high hydraulic conductivity. It is unknown what effect, if any, dilution from ground water infiltration, precipitation, or surface water run-on is having on the concentration of the parameters found in the C&DD leachate.

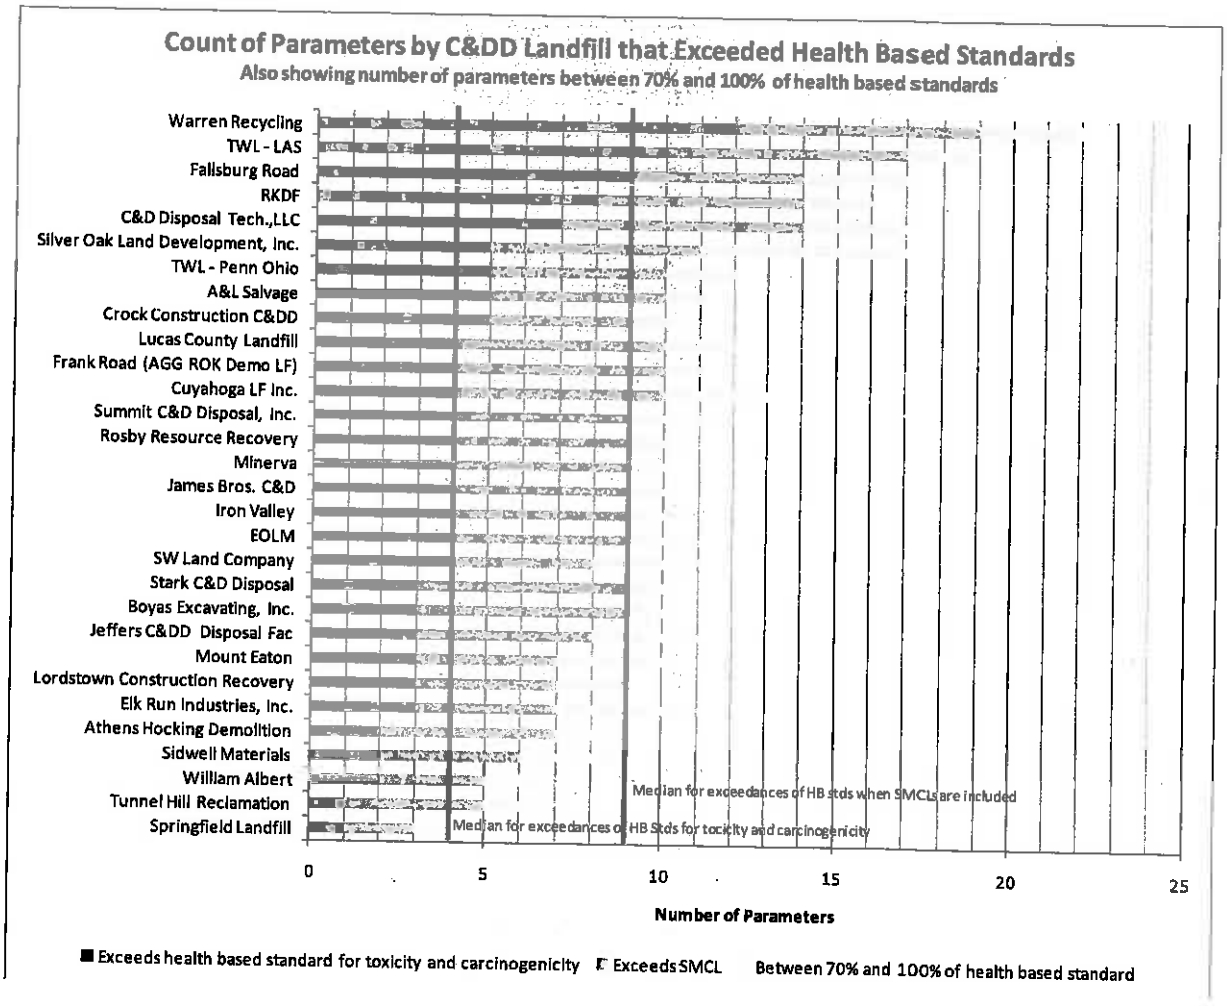

Figure 9. Number of parameters at each landfill that exceeded the health based standards and also showing the number of parameters that were 70% to 100% of a health based standard

The concentrations of the parameters in Ohio C&DD leachate that exceeded health based standards, excluding SMCLs[7], were such that discharge of C&DD leachate to the environment is not lawful in Ohio. For example, the concentrations of 21 of the parameters in C&DD leachate exceeded the endangerment standards contained in Ohio EPA's Underground Injection Control Program rules (see paragraph (A) of OAC Rule 3745-37-07). The maximum concentrations detected exceeded the endangerment standards by as much as 80 times. The mean concentrations exceeded the endangerment standards by as much as 10 times.

The concentrations of the seven parameters in Ohio C&DD leachate that exceeded SMCLs were such that discharge of the leachate with maximum concentrations of parameters (exceeding SMCLs by as much as 2,323 times) or the mean concentrations of parameters (exceeding SMCLs by as much as 79 times) could render good quality ground water objectionable or unusable for consumption, washing, and industrial production without installing treatment equipment.

[7] (See Labeling of SMCLs as health based standards in this report on page 13 for more information).

There were numerous parameters that were often detected, including a wide variety of metals, inorganic parameters, and organic parameters, in Ohio C&DD leachate of sufficient concentration that, if released to ground water would violate discharge limits of Ohio rules, could cause or contribute to water pollution, and could adversely impact downgradient residential wells and public drinking water supply wells. Of particular concern are those parameters that were detected in the C&DD leachate that were multiples of the health based standards (such as vinyl chloride, benzene, arsenic, lead, boron, and manganese), carcinogens (such as vinyl chloride and arsenic), mobile in the environment (such as vinyl chloride, benzene, and arsenic), and persistent in the environment (such as antimony and lead).

Comparison against surface water quality standards

The surface water quality standards used in this report originate with the Ohio surface water quality standards from OAC Chapter 3745-1. The surface water quality standard for strontium is being updated by Ohio EPA. The updated standard was used instead of the standard for strontium contained in OAC Chapter 3745-1.

The surface water quality standards for the aquatic life criteria for metals have a range that is based on the hardness of the stream water. The surface water quality standards shown in Table 10 that were used in this report are based on the mean water hardness in Ohio of 275 mg/L.

Table 10. Surface water quality standards based on hardness of receiving stream for select metals

Parameter	Range (ug/L)	Used in this report
Cadmium	2.5-7.3	5.5
Chromium	86-270	200
Copper	9.3-30	22
Lead	6.4-37	23
Nickel	52-170	120
Zinc	120-390	280

Ninety five parameters were detected. Of the 95 parameters that were detected, 71 parameters had surface water quality standards assigned. Twenty five of the 71 parameters that have surface water quality standards were below the standards (35 percent) and 46 of the parameters exceeded the standards at one or more landfill (65 percent).

Table 11 and Figure 10 show the 46 parameters that exceeded a surface water quality standard in each parameter category (excluding dissolved metals and dissolved trace elements). The exceedances of surface water quality standards at Ohio C&DD landfills occurred mainly due to heavy metals, trace elements, pesticides, other ions, phenolics, chlorinated solvents, gasoline, light metals, and PAHs, with one parameter exceeding the surface water quality standards from the categories of non-chlorinated solvents, phthalates, and substituted benzenes. TDS also exceeded the surface water quality standards.

Heavy metals account for 9 of the exceedances (20 percent); light metals, trace elements, and other ions account for 15 of the exceedances (33 percent); and organic parameters account for 21 of the exceedances (44 percent). TDS accounts for the remaining percentage.

Not counted in Table 11 or shown in Figure 10 are seven additional dissolved heavy metals, (antimony, arsenic, barium, lead, mercury, nickel, and thallium), six dissolved trace elements (boron, copper, iron, manganese, and selenium) and two dissolved light metals (aluminum and vanadium), which also exceeded surface water quality standards. These were not included to avoid double counting parameters that had both dissolved concentrations and total concentration results that exceeded the surface water quality standards.

Total cadmium did not exceed the surface water quality standard (it was 83 percent of the standard). Dissolved cadmium did exceed the surface water quality standard at one landfill. This was the only heavy metal where the total concentrations measured did not exceed the standard but a dissolved concentration did. Therefore, cadmium was added to the list of heavy metals that exceeded the surface water quality standards in Table 11 and shown in Figure 10.

However, due to the questions regarding the unusual occurrence of a dissolved concentration being higher than totals concentrations, cadmium was ultimately categorized as a noteworthy parameter, rather than a parameter with a high level of concern or a parameter with a moderate level of concern

Also not counted in Table 11 or shown Figure 10 is pH and one additional parameter in the category "other ion" (fluoride). These parameters were between 80 percent and 100 percent of the surface water quality standards. Fluoride was detected at all 30 landfills and pH was measured at all 30 landfills.

Of the 46 parameters counted in Table 11, one PAH (acenaphthene), five pesticides (4,4'-DDE, 4,4'-DDT, dieldrin, heptachlor, and heptachlor epoxide), one phenolic (2,4-dimethylphenol), and one substituted benzene (dibenzofuran) were detected at one landfill each. All the other parameters were detected at two or more C&DD landfills.

Table 12 shows the list of 59 organic parameters sorted by parameter category that were detected in C&DD leachate. The 21 parameters that exceeded surface water quality standards at one or more landfill are highlighted.

Table 13 shows the list of 36 metal and inorganic parameters sorted by parameter category that were detected in C&DD leachate. The 25 parameters that exceeded surface water quality standards (including dissolved cadmium) at one or more landfill are highlighted. For metals and trace elements, the information for both total and dissolved concentrations that exceeded the surface water quality standards are included in the table and highlighted so that it is clear which totals parameters and dissolved parameters exceeded the surface water quality standards.

Table 11. Number of parameters in each parameter category that exceeded surface water quality standards at one or more Ohio C&DD landfills

Parameter Category	Number of parameters that exceeded a SWQ	Percentage (%)
Organic Parameters		
Pesticides	8	17

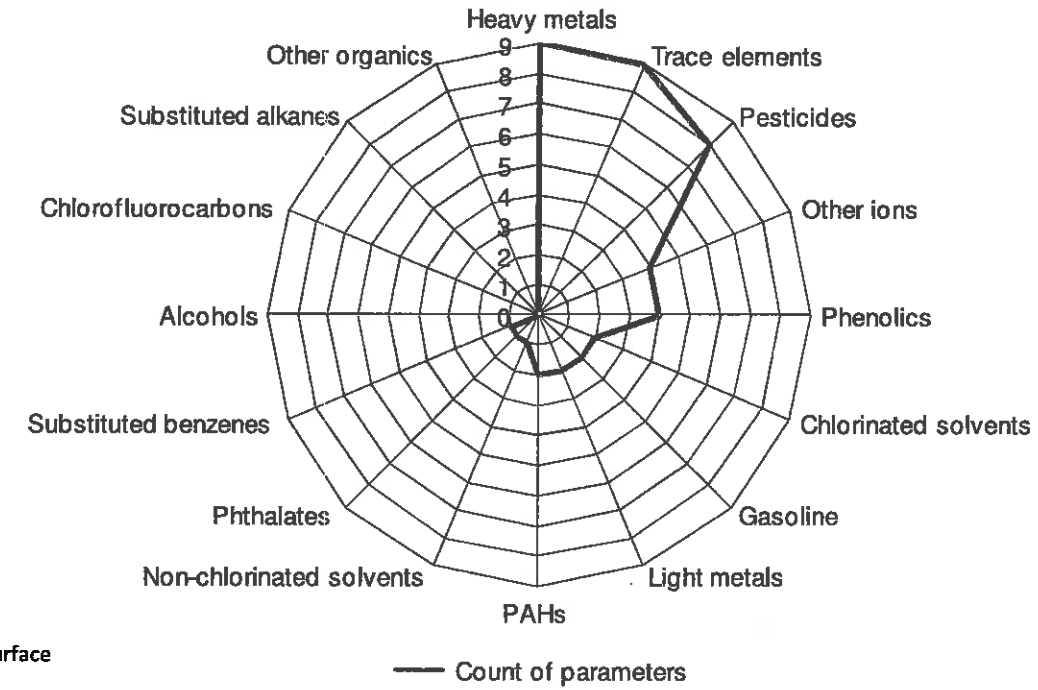
TDS	1	2
Total	46	

Number of Leachate Parameters that Exceed Surface Water Quality Standards at One or More C&DD Landfills

Sorted by Parameter Categories with Most to Fewest Parameters Exceeding



TDS also exceeded the Surface Water Quality Standards

Seven additional dissolved heavy metals, (antimony, arsenic, barium, lead, mercury, nickel, and thallium), five dissolved trace elements (boron, copper, iron, manganese, and selenium) and two dissolved light metals (aluminum and vanadium), also exceeded surface water quality standards. These were not included in this figure to avoid double counting parameters that had both dissolved concentrations and total concentration results that exceeded the surface water quality standards. The exception is that dissolved cadmium exceeded the surface water quality standard, but total cadmium did not (it was 83 percent of the standard). Therefore, cadmium was counted with the heavy metals that exceeded the surface water quality standards.

One PAH (acenaphthene), five pesticides (4,4'-DDE, 4,4'-DDT, dieldrin, heptachlor, heptachlor epoxide), one phenolic (2,4-dimethylphenol), and one substituted benzene (dibenzofuran) were detected at one landfill each. All the other parameters were detected at two or more C&DD landfills.

Also not counted in this figure is one additional parameter in the category "other ion" (fluoride), one additional dissolved trace element (zinc), and pH. These parameters were between 80% and 100% of the surface water quality standards. Fluoride was detected at all 30 landfills, dissolved zinc was detected at 16 landfills, and pH was measured at all 30 landfills.

Table 14 shows the parameters in Ohio C&DD leachate that are of concern due to exceedances of surface water quality standards. The level of concern for a parameter was determined by evaluating:

- The number of landfills where it was detected.
- The magnitude of exceedance of a surface water quality standard for the minimum, maximum, mean, and median concentrations.
- Whether either of the confidence limits of the mean exceeded the surface water quality standard.

A high level of concern exists for one chlorinated solvent (vinyl chloride), one gasoline component (benzene), four heavy metals (arsenic, barium, lead, and mercury), one light metal (aluminum), four other ions (chloride, cyanide, ammonia, and sulfate), one pesticide (gamma chlordane), two phenolics (3-,4-methylphenol and phenol), one phthalate (bis(2-ethylhexyl)phthalate), seven trace elements (boron, copper, iron, manganese, phosphorus, selenium, and zinc), and TDS.

The maximum detected concentration for these parameters exceeded the surface water quality standards from 4.7 times (cyanide and chloride) to 2,323 times (iron).

Based on the median concentrations measured, the leachate at half or more of the Ohio C&DD landfills exceeded the surface water quality standards for:

- Manganese by 35 times.
- Iron by 31 times.
- Boron by 11 times.
- TDS by 6 times.
- Arsenic by 4 times.
- Ammonia by 2 times.
- Barium by 1.7 times.
- Sulfate by 1.3 times.
- Chloride by 1.2 times.

Based on the upper and lower confidence limits of the mean, during future leachate sampling, the mean concentrations across all of the Ohio C&DD landfills are expected to be:

- 28 to 56 times the standard for manganese.
- 16 to 142 times the standard for iron.
- 8 to 13 times the standard for boron.
- 7 to 11 times the standard for ammonia.
- 5 to 79 times the standard for mercury.
- 5 to 7 times the standard for TDS.
- 3 to 7 times the standard for arsenic.
- 1.4 to 3 times the standard for barium.
- 1 to 1.7 times the standard for chloride.

Excepting seven parameters, all of the parameters assigned a high level of concern had mean concentrations that exceeded the surface water quality standards from 1.1 times (vinyl chloride) to 79 times (iron).

Excepting two parameters, all of the parameters assigned a high level of concern had upper confidence limits of the mean that exceeded the surface water quality standard from 1.2 times (lead) to 142 times (iron).

Of the seven parameters that were assigned a high level of concern even though they had mean concentrations that did not exceed the standard:

- Benzene was assigned a high level of concern because it:
    - is a known carcinogen.
    - Was detected at 80 percent of C&DD landfills.
    - Had a maximum concentration detected that was 9 times higher than the surface water quality standard.
    - Had an upper confidence limit of the mean that was 1.25 times higher than the surface water quality standard.
- Copper was assigned a high level of concern because it:
    - Was detected at 50 percent of the Ohio C&DD landfills.
    - Had a maximum concentration detected that was 8.3 times higher than the surface water quality standard.
    - Had a mean concentration that was greater than 90 percent of the surface water quality standard.
    - Had an upper confidence limit of the mean that was 1.6 times the surface water quality standard.
- Cyanide was assigned a high level of concern because it:
    - Was detected at 50 percent of the C&DD landfills.
    - Had minimum concentrations detected of 1.1 times the standard and maximum concentrations detected of 4.7 times the standard.
    - The mean concentration was 90 percent of the standard.
    - The upper confidence limit was 1.3 times the standard.
- Lead was assigned a high level of concern because it:
    - Was detected at 37 percent of the landfills.
    - Had a maximum concentration detected that was 10 times the surface water quality standard.
    - And has an upper confidence limit of the mean that was 1.2 times higher than the surface water quality standard.
- Phosphorus was assigned a high level of concern because it:
    - Was detected at 67 percent of the Ohio C&DD landfills.
    - Had a maximum concentration detected of 22.8 times the surface water quality standard.
    - Had a mean concentration greater than 90 percent of the surface water quality standard.
    - Had an upper confidence limit of the mean that was 1.5 times greater than the surface water quality standard.

- Selenium was assigned a high level of concern because it:
    - Was detected at of the 20 percent of the C&DD landfills.
    - Had a minimum concentration detected that was 1.2 times higher than the surface water quality standard.
    - Had a maximum concentration detected that was 6.2 times higher than the surface water quality standard.

- Zinc was assigned a high level of concern because it:
    - Was detected at 70 percent of the C&DD landfills.
    - Had a maximum concentration detected that was 11.4 times the surface water quality standard.
    - Had a 95 percent upper confidence limit that was 90 percent of the surface water quality standard.

A moderate level of concern exists for one chlorinated solvent (methylene chloride), one gasoline component (toluene), three heavy metals (antimony, nickel, and thallium), one light metal (vanadium), one non-chlorinated solvent (carbon disulfide), one PAH (naphthalene), two pesticides (alpha chlordane and pentachlorophenol), and two trace elements (chromium and cobalt).

Toluene, antimony, nickel, thallium, vanadium, carbon disulfide, naphthalene, pentachlorophenol, chromium, and cobalt were determined to be of a moderate level of concern because:

- Based on the upper and lower confidence limits the mean concentration across all of Ohio's C&DD landfills would be expected to be less than 60 percent of the surface water quality standard for each of these parameters.

- None of the parameters had minimum detected concentrations that exceeded a standard.

- However, the maximum concentrations detected of these parameters were from 1.1 times (toluene) to 6.5 times (vanadium) the surface water quality standards.

Methylene chloride could have been assigned a high level of concern because it has toxic effects and is a suspected carcinogen. However it was assigned a moderate level of concern even though the maximum detected concentration was more than 16 times the standard and the upper confidence limit was 99 percent of the standard because the parameter was detected at seven landfills and exceeded the standard at only two landfills. If additional sampling shows that methylene chloride is detected more frequently, or exceeds the surface water quality standard at more landfills, it is recommended that the level of concern be raised to "high."

Alpha chlordane could also have been assigned a high level of concern because it is persistent in the environment and causes adverse effects to aquatic life at very low concentrations. However, it was assigned a moderate level of concern because the parameter was detected at only two landfills and exceeded the standard at both, even though the minimum concentration detected was 98 times the standard, the maximum detected concentration was 260 times the standard, and the upper confidence limit was 31 times the standard. If additional sampling

shows that alpha chlordane is detected more frequently, or exceeds the surface water quality standard at more landfills, it is recommended that the level of concern be raised to "high."

Parameters that are noteworthy are beryllium, cadmium, fluoride, acenaphthene, 4,4'-DDE, 4,4'-DDT, dieldrin, heptachlor, heptachlor epoxide, 2,4-dimethylphenol, 2-methylphenol, dibenzofuran, and pH.

The PAH, acenaphthene, the pesticides, 4,4'-DDE, 4,4'-DDT, dieldrin, heptachlor, heptachlor epoxide, and 2,4-dimethylphenol, the phenolic, 2-methylphenol, and the substituted benzene, dibenzofuran, were determined to be noteworthy because even though they exceeded the surface water quality standards from 3.6 times (acenaphthene) to 3,277 times (dieldrin), they were detected at only one or two landfills.

Beryllium was considered noteworthy because it was detected a six landfills and exceeded the standard at one landfill with the maximum concentration detected of 4.2 times the surface water quality standard.

Other parameters that were determined to be noteworthy include pH and fluoride, because the concentrations detected exceeded 80 percent of the surface water quality standards.

For pH, the minimum pH detected (6.6 S.U.) was 98 percent of the surface water quality standard for minimum pH and the maximum pH detected (7.94 S.U.) was 88 percent of the surface water quality standard for maximum pH. The effects of pH alter leachability, the ease of migration of some parameters in the environment, the toxicity of some metals, and can have adverse effects on some aquatic organisms.

For total cadmium and fluoride, detection occurred at multiple landfills (3 for cadmium, all 30 for fluoride) and the maximum detected concentrations exceeded 80 percent of the surface water quality standards. In the case of cadmium, dissolved concentrations were detected at 1.06 times the surface water quality standard at one landfill.

Table 14. Parameters of concern in Ohio C&DD leachate when compared with surface water quality standards

*At one landfill, dissolved cadmium exceeded the surface water quality standards by 1.1 times

Table 15 shows the parameter information (columns 1 – 5), descriptive statistics (columns 6 – 12), and the results of the comparisons of the minimum detected, maximum detected, mean, and 95 percent upper confidence limits for each parameter with the surface water quality standards (columns 13 – 19). The parameters are grouped by parameter category.

To calculate the mean concentration and the 95 percent confidence limits in Table 15, non-detects at the method detection limit were set equal to zero and estimated lab values were included in the calculation. This may have resulted in the mean concentrations being slightly lower than if analytical methods with lower method detection limits had been used.

In Table 15, the minimum detected column (Column 7) is the minimum concentration measured above the method detection limit at any one landfill. The maximum detected column (Column 8) is the maximum concentration measured at any one landfill.

In Table 15, columns 13 through 19 show the surface water quality standards and the results of the comparisons of the descriptive statistics with those standards. The darker highlights identify comparisons that show exceedances of the surface water quality standards. The lighter highlights identify comparisons that show results 70 percent to 100 percent of the surface water quality standard.

In Table 15, columns 14 through 19 were calculated by taking the ratio of the descriptive statistic to the surface water quality standard. This means that if a number is equal to or greater than one it can be read as the number of times the parameter exceeds the surface water quality standard. If the number is less than one, it can be multiplied by 100 and read as a percentage of the surface water quality standard.

Table 15 used the Ohio surface water quality standards from OAC Rule OAC 3745-1 as the standards for comparison with the descriptive statistics for each parameter. The surface water quality standard for strontium is being updated by Ohio EPA. The updated standard was used instead of the standard for strontium contained in OAC Chapter 3745-1.

Table 15 includes both the dissolved concentration and total concentration results for the metals and trace elements so that the descriptive statistics and comparisons with the surface water quality standards can be seen for both types of parameters. Table 11 does not count 14 dissolved concentration results for metals and trace elements. That is why Table 15 contains information for 60 parameters that exceeded surface water quality standards and Table 11 includes a total count of 46 parameters that exceeded surface water quality standards.

The 14 parameters that had both dissolved and totals concentrations that exceeded the surface water quality standards are as follows:

- Seven additional dissolved heavy metals (antimony, arsenic, barium, lead, mercury, nickel, and thallium).
- Five dissolved trace elements (boron, copper, iron, manganese, and selenium).
- Two dissolved light metals (aluminum and vanadium).

Parameters that are also shown in Table 15, but are not counted in Table 11 because they did not exceed the surface water quality standards are pH and one additional "other ion" (fluoride). These parameters were 80 percent to 100 percent of the surface water quality standards. Fluoride was detected at all 30 landfills and pH was measured at all 30 landfills. Fluoride and pH were included in Table 15 for completeness because they were discussed as noteworthy parameters previously.

Methylene chloride is a common lab contaminant. Sufficient concentrations of methylene chloride were found in trip blanks for two of the samples (Rosby Resource C&DD landfill and Silver Oak C&DD landfill) to cast doubt on the validity of the methylene chloride results for those samples. Therefore, the suspect sample results were removed from the data set used to produce this summary.

For two landfills that had multiple samples measured for pH (Summit C&D Disposal, Inc. and TWL-Penn Ohio), each had one of the results for pH recorded at 9.04 S.U. This value is extreme when compared with the pH measurements of the other landfills and with the other pH measurement taken at each of those two landfills. It is also unusual that both landfills would have exactly the same extreme pH. It is suspected that field measurement bias resulted in the two anomalous pH readings. They were, therefore, excluded from the tables and calculations in this Ohio EPA study. If additional sampling confirms the high pH values, then the understanding of the pH of Ohio C&DD leachate will need to be revised.

Table 15. Statistics for Ohio C&DD leachate parameters that exceeded surface water quality standards also showing parameters that were between 70% and 100% of the standards.

Note A - For the purpose of calculating descriptive statistics in this table, non-detects at the method detection limit were set equal to zero and lab estimated values were included in the calculation. Because of this, minimum and median concentrations showing zero concentration value cannot be interpreted as "not present," but should be interpreted as "concentration is less than the method detection limit."

Note B - Non-detects below the method detection limit are not included in the minimum detected columns.

Note C - Methylene chloride is a common lab contaminant. Sufficient levels were found in trip blanks for two samples to cast doubt on the validity of the methylene chloride results for those samples. As a result, the suspect sample results were removed from the data set used to produce this summary.

Note D - For pH, two landfills had two suspect identical values that were extremely high compared to other pH measurements at the same facility and the pH of leachate at other C&DD landfills. The two anomalous pH measurements may possibly be from sampling bias in the field. These two landfills had two measurements for pH each. The descriptive statistics for pH were calculated excluding the two suspect high values, but included the other two values. Column 14 is calculated by dividing the minimum pH standard of 6.5 by the minimum pH measured at any one landfill . Column 15 is calculated by taking the maximum pH measured and dividing it by the maximum surface water quality pH standard of 9.0

Note E - Surface water quality standards are from chapter 3745-1 of the Ohio Administrative Code, except the standard for strontium which is being updated by Ohio EPA. The updated standard for strontium was used in this report.

Note G - Multiple samples were taken from seven C&DD landfills. To prevent those seven landfills from skewing the results for mean, median, and confidence limits, the results for each parameter at each landfill that had multiple samples were averaged and used as a single data point in the calculations.

All 30 C&DD landfills had from 3 to 26 parameters that exceeded surface water quality standards. The median was 11 parameters exceeding the standards. The leachate from 29 of the C&DD landfills had 6 or more exceedances of surface water quality standards.

The top five landfills with the most parameters that exceeded surface water quality standards are:

- TWL – LAS C&DD landfill with 26
- Warren Recycling C&DD landfill with 24
- Silver Oak Land Development C&DD landfill with 21
- RKDF C&DD landfill with 20
- Fallsburg Road C&DD landfill with 16

The one landfill that had less than six parameters that exceeded surface water quality standards is suspected of having leachate that is diluted from ground water infiltration, surface water run-on or precipitation. There was an average of two additional parameters at each landfill that were 70 percent to 100 percent of a surface water quality standards standard, with a minimum of one and a maximum of four additional parameters (See Figure 11).

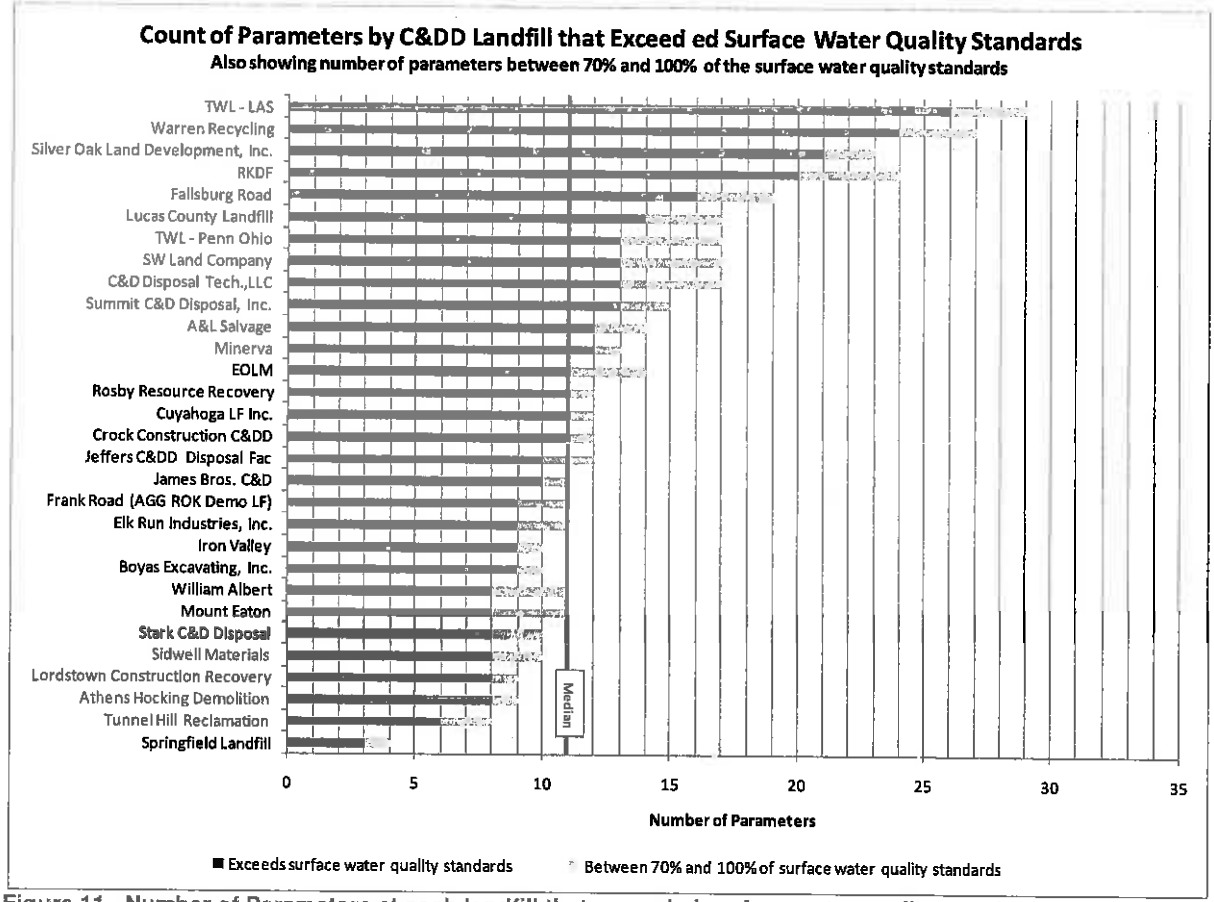

Figure 11. Number of Parameters at each landfill that exceeded surface water quality standards and also showing the number of parameters that were 70% to 100% of surface water quality standards

The concentrations of the parameters in Ohio C&DD leachate that exceeded surface water quality standards were such that discharge of C&DD leachate to surface water would not be lawful in Ohio without treatment and a permit. The concentrations of the parameters in C&DD leachate exceeded the surface water quality standards rules found in OAC Chapter 3745-1. The maximum concentrations detected exceeded the surface water quality standards by as much as much as 2,323 times. The mean concentrations for each parameter exceeded the surface water quality standards by as much as 79 times.

There are numerous parameters that were often detected in Ohio C&DD leachate, including a wide variety of metals, inorganic parameters, and organic parameters that were of sufficient concentration that, if released to surface water could cause or contribute to water pollution, possibly impact public health and the environment, and adversely affect public drinking water supplies that use surface water sources. Of particular concern are those parameters that were detected in the C&DD leachate that were multiples of the surface water quality standards (such as vinyl chloride, benzene, arsenic, barium, mercury, phenol, and gamma chlordane), carcinogens (such as vinyl chloride, benzene, and arsenic), mobile in the environment (such as vinyl chloride, benzene, arsenic, TDS, and phosphorus), persistent in the environment (such as mercury, antimony, and lead), or which bioaccumulate (such as chlordane, arsenic, copper, lead, mercury, nickel, selenium, and zinc).

Comparison with ground water constituents indicating impact at Ohio C&DD landfills

In 2007, Ohio EPA evaluated 47 C&DD landfills to determine if ground water impacts were indicated. Of the 47 landfills, 31 (66 percent) had indications of ground water impact. The parameters indicating ground water impact at these landfills, in order of frequency, included sulfate, chloride, magnesium, ammonia, sodium, potassium, organic compounds, calcium, bicarbonate, iron, COD, specific conductance, manganese, total alkalinity, TDS, pH, arsenic, and nitrite. The organic compounds included toluene, benzene, low level polycyclic aromatic hydrocarbons (PAHs), and styrene (Ohio EPA, 2008).

There were 20 parameters and one parameter category (PAHs) that were identified in the Ohio EPA 2008 study, "Hydrogeologic Evaluation of Construction and Demolition Debris (C&DD) landfills in Ohio." Of the 20 parameters, two (bicarbonate and specific conductance) were not sampled in the Ohio EPA 2007 C&DD leachate sampling event. All of the remaining 18 parameters were detected in Ohio C&DD leachate. Nine of the leachate parameters exceeded health based standards.

The 18 parameters that were detected in Ohio C&DD leachate that had indications of impacting ground water at Ohio C&DD landfills are, total alkalinity, arsenic, benzene, calcium, COD, chloride, iron, magnesium, manganese, ammonia, nitrate-nitrite, pH, potassium, sodium, styrene, sulfate, toluene, and TDS.

COD, pH, TDS, and total alkalinity can usually be measured in most leachate. The range of the measurements in Ohio C&DD leachate for COD (50.1 to 4,390 mg/L), pH (6.6 to 7.94 S.U.), TDS (634 to 7,040 mg/L), and total alkalinity (145 to 3,750 mg/L) were such that measureable impacts to ground water could occur if the leachate were released to the environment. However, the conclusion that impact by these parameters has occurred would likely require statistical comparisons with upgradient background ground water quality.

There were two PAHs detected during the Ohio EPA 2007 C&DD leachate sampling event (acenaphthene and naphthalene). Little PAH data was available for the Ohio EPA 2008 study of ground water quality at Ohio C&DD landfills. Analysis results for PAH's were rarely reported as being sampled in ground water at Ohio C&DD landfills. Naphthalene and acenaphthene were not reported as having been analyzed in the ground water of the landfills evaluated in the Ohio EPA 2008 study of ground water quality at Ohio C&DD landfills. Even so, PAHs were identified as showing indications of impacting ground water in the Ohio EPA 2008 study of ground water quality at one Ohio C&DD landfill. These include the PAHs (benzo (b) fluoranthene, benzo (k) fluoranthene, benzo (a) pyrene, benzo (ghi) perylene, di-benzo (a,h) anthracene, and indeno (1,2,3-cd) pyrene. None of these six PAHs were detected in the leachate from the 30 C&DD landfills sampled in 2007. However, the leachate from the landfill where the PAH impacts to ground water were indicated was not sampled due to lack of a location to obtain a sample without boring into the debris. This could mean that the leachate at the one landfill may have PAHs that the 30 C&DD landfills that were sampled do not or the PAHs in the ground water are from a different source than the C&DD landfill.

Table 16 shows the organic parameters that were detected in Ohio C&DD leachate.

Table 17 shows the metals and inorganic parameters that were detected in Ohio C&DD leachate.

In both tables, the shaded parameters identify the parameters from the Ohio EPA 2008 study, "Hydrogeologic Evaluation of Construction and Demolition Debris (C&DD) landfills in Ohio" that may be impacting ground water at Ohio C&DD landfills. The asterisked parameters also exceeded health based standards, surface water quality standards, or both.

Eighteen parameters were detected in C&DD leachate that may be impacting ground water at Ohio C&DD landfills. Table 18 shows the descriptive statistics and comparisons with health based standards and surface water quality standards for the 18 parameters. Of those 18 parameters:

- 12 parameters were detected in the leachate at 30 C&DD landfills:

Total Alkalinity	Nitrogen, Ammonia
Calcium	pH
COD	Potassium
Chloride	Sodium
Magnesium	Sulfate
Manganese	TDS

- 4 parameters were detected in the leachate at from 17 to 29 landfills:

Benzene	Arsenic
Toluene	Iron

- 9 parameters exceeded a health based standard.

Ammonia	Manganese
Arsenic	Sodium
Benzene	Sulfate
Chloride	TDS
Iron	

- Two parameters were detected in the leachate at five landfills:

Nitrate-nitrite
Styrene

All of the metals listed in the above tables had both total concentration results and dissolved concentration results detected. Three metals showing indications of having impacted ground water at C&DD landfills (arsenic, iron, and manganese) also had dissolved results that exceeded health based standards and surface water quality standards.

The finding by Ohio EPA that there are indications that 18 parameters may have impacted ground water at Ohio C&DD landfills is supported as plausible by this report because of the following:

- 16 of the 18 parameters were detected at more than 60 percent of the C&DD landfills.
- 9 of the parameters exceeded a health based standard.
- The 5 parameters that do not have a health based standard were detected with mean concentrations from 109 mg/L to 1,642 mg/L.

This comparison is not to be used to conclude that impact to ground water has occurred at any C&DD landfill in Ohio. A site specific ground water assessment is necessary to determine impact to ground water at individual landfills.

Table 18. Descriptive statistics and comparisons with health based and surface water quality standards for the C&DD leachate parameters possibly impacting ground water at Ohio C&DD landfills

Note A - For the purpose of calculating descriptive statistics in this table, non-detects at the method detection limit were set equal to zero and lab estimated values were included in the calculation. Because of this, minimum and median concentrations showing zero concentration value cannot be interpreted as "not present," but should be interpreted as "concentration is less than the method detection limit."

Note B - Non-detects below the method detection limit are not included in the minimum detected columns.

Note D - For pH, two landfills had two suspect identical values that were extremely high compared to other pH measurements at the same facility and the pH of leachate at other C&DD landfills. The two anomalous pH measurements may possibly be from sampling bias in the field. These two landfills had two measurements for pH each. The descriptive statistics for pH were calculated excluding the two suspect high values, but included the other two values. Columns 15 and 22 are calculated by dividing the minimum pH standard of 6.5 by the minimum pH measured at any one landfill. Columns 16 and 23 are calculated by taking the maximum pH measured and dividing it by the maximum pH standard of 8.5 (HB standard) or 9.0 (SWQ standard).

Note E - MCL = US EPA Maximum Contaminant Level or Action Level; SMCL = US EPA Secondary MCL; VAP = Ohio EPA, Voluntary Action Program Generic Unrestricted Potable Use Standard; LTHA = US EPA Lifetime Threshold Health Advisory

Note G - Multiple samples were taken from seven C&DD landfills. To prevent those seven landfills from skewing the results for mean, median, and confidence limits, the results for each parameter at each landfill that had multiple samples were averaged and used as a single data point in the calculations.

Summary

Ohio C&DD leachate from 30 landfills was analyzed for 273 parameters; 95 parameters were detected at one or more C&DD landfill.

Of those 95 parameters:

- 64 percent were organic parameters (59 parameters).
- 23 percent were light metals, trace elements, and other ions (23 parameters).
- 9 percent were heavy metals (9 parameters).
- The remaining percentage was made up of COD, pH, TDS, and total alkalinity.

Two metals (silver and tin) were not detected at any C&DD landfill. Organic parameters comprised the remaining 178 parameters that were not detected.

The most common parameters detected in Ohio C&DD leachate in order from most to fewest were trace elements, light metals, other ions, heavy metals, gasoline, chlorinated solvents, pesticides, non-chlorinated solvents, substituted benzenes, PAHs, phenolics, and chlorofluorocarbons accounting for 89 percent of the parameters detected. COD, pH, TDS, and total alkalinity were measured at all of the landfills, which accounts for 10 percent of the detections. The remaining one percent of detections included phthalates, substituted alkanes, alcohols, and one miscellaneous organic parameter. Also expected was the high detection frequency of trace elements, light metals, other ions, and heavy metals.

What was unexpected was the high detection frequency of gasoline, chlorinated solvents, pesticides, and non-chlorinated solvents.

The dominant anion in Ohio C&DD leachate was bicarbonate. Chloride typically made up less than 20 percent of the major anions in Ohio C&DD leachate. There was no dominant cation, though the leachate tended to have a higher proportion of calcium and magnesium than the other major cations.

Since the majority of the C&DD landfills plot in one quadrant of each section of the Piper diagram, Piper diagrams may prove useful when comparing C&DD leachate with leachate from other types of landfills, ground water, and surface water. However, seven of the landfills (1/4) did not fit the typical profile of C&DD leachate demonstrated by the other 23 landfills. This shows that there was wide variability from landfill to landfill in the proportions of the major ions.

The leachate from all 30 C&DD landfills had from 3 to 29 parameters with concentrations that exceeded health based standards, surface water quality standards, or both. The median was 12.5 parameters exceeding the standards. The leachate from 29 of the 30 C&DD landfills had eight or more parameters that exceeded the standards (See Figure 12). The one landfill that had less than eight parameters that exceeded standards is suspected of having leachate that was diluted from ground water infiltration, surface water run-on, or precipitation.

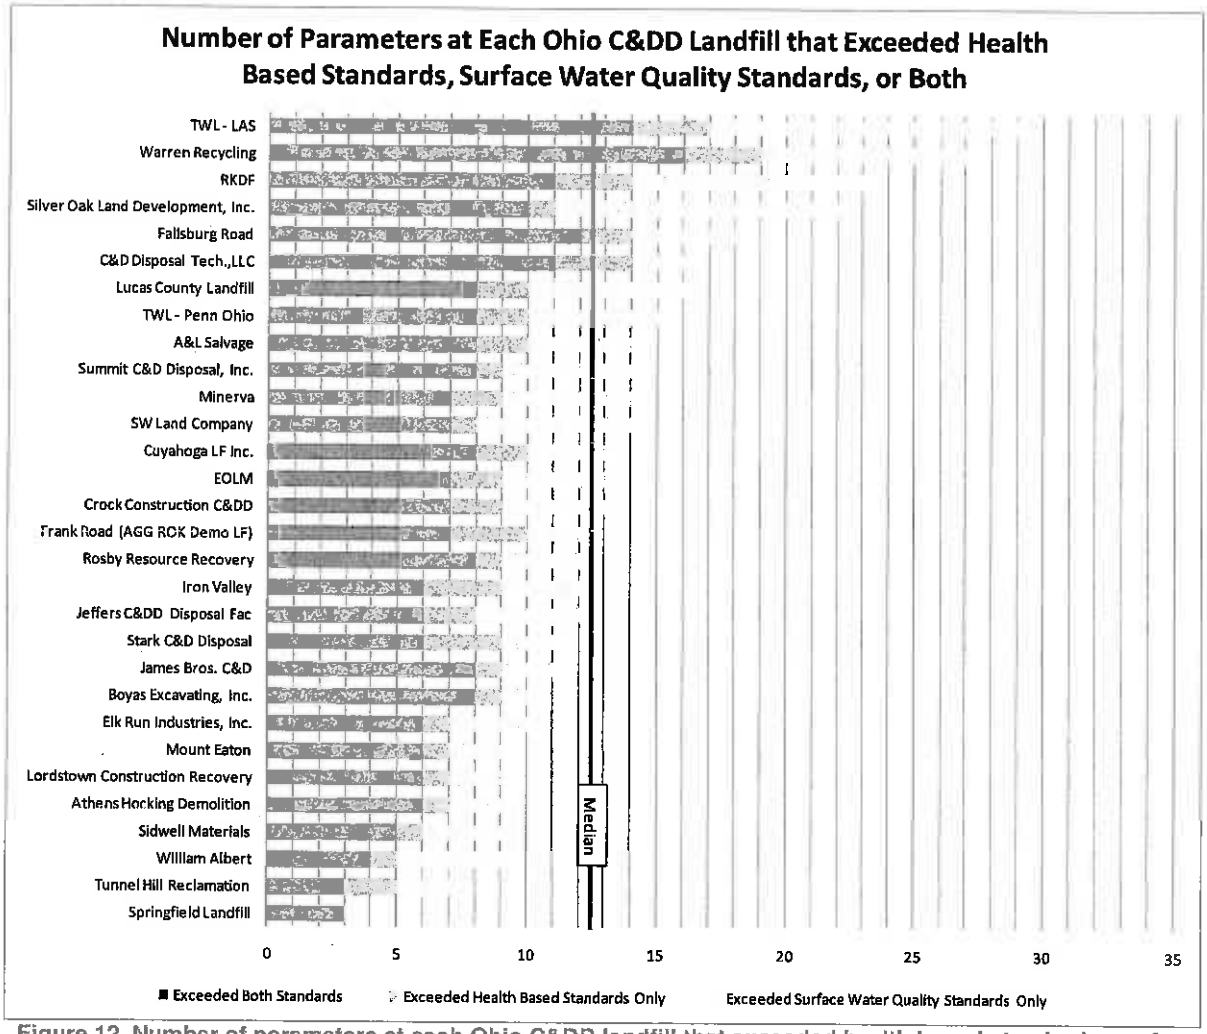

Figure 12. Number of parameters at each Ohio C&DD landfill that exceeded health based standards, surface water quality standards, or both

Of the 95 parameters detected in C&DD leachate, 52 raised a concern when compared with health based standards or surface water quality standards. Of those 52 parameters, 27 raised a concern with both sets of standards. Twenty three parameters (56 percent) were organic parameters and 29 parameters (44 percent) were metals and inorganic parameters (See Table 19).

Table 19. Summary of level of concern due to health based standards and surface water quality standards for each Ohio C&DD leachate parameter.

Cadmium, is counted as noteworty based on both total and dissolved concentrations for the reasons discussed in the narrative found immediately above Table 5.

When compared with health based standards:

- There is a high level of concern for nine parameters, including one chlorinated solvent (vinyl chloride), one gasoline component (benzene), two heavy metals (arsenic and lead), one light metal (strontium), one phenolics (3-,4-methylphenol), one phthalate (bis(2-ethylhexyl)phthalate), and two trace elements (boron and manganese).

  These parameters were detected at multiple C&DD landfills and frequently exceeded health based standards; the health based standard exceeded was for protecting against toxic or carcinogenic effects; and the magnitude of the exceedances were large, with maximum concentrations detected from 2.3 times (strontium) to 80 times (bis(2-ethylhexyl)phthalate) the health based standards.

  For four of the parameters (arsenic, boron, manganese, and strontium) it is likely that these parameters will often be detected at concentrations equal to or in excess of the health based standards during future leachate sampling.

  For two other parameters (3-,4-methylphenol and bis(2-Ethylhexyl)phthalate), which though they were detected less frequently, when detected were likely to exceed the health based standards.

- There is a moderate level of concern for 10 parameters, including one chlorinated solvent (methylene chloride), five heavy metals (antimony, barium, beryllium, nickel, and thallium), one light metal (vanadium), one PAH (naphthalene), one pesticide (pentachlorophenol) and one trace element (chromium). These parameters were determined to be of moderate concern because:

  - Less than 50 percent of the landfills sampled exceeded the standard for these parameters.

  - Based on the upper and lower confidence limits the mean concentration across all of Ohio's C&DD landfills would be expected to be less than 60 percent of the standard for each of these parameters, except methylene chloride, which has an upper confidence limit of 99 percent of the health based standard.

  - None of the parameters had minimum detected concentrations that exceeded a standard.

  - However, the maximum concentrations detected of these parameters exceeded the health based standard from 1.15 times (naphthalene) to 16.4 times (methylene chloride).

  - Methylene chloride could have been assigned a high level of concern because it has toxic effects and is a suspected carcinogen. However it was assigned a moderate level of concern even though the maximum detected concentration was more than 16 times the standard and the upper confidence limit was 99 percent of the standard because the parameter was detected at seven landfills and exceeded the standard at only two landfills. If additional sampling shows that methylene chloride is detected more frequently, or exceeds the health based standard at more landfills, it is recommended that the level of concern be raised to "high."

- Aluminum, chloride, iron, ammonia, sodium, sulfate, and TDS were determined to be noteworthy because they exceeded SMCLs and are likely to exceed the SMCLs during future leachate sampling at C&DD landfills.

- Other noteworthy parameters include: pH, cadmium, fluoride, and the pesticides, MCPA and disulfoton either because they were found in all C&DD landfill leachate samples and exceeded 70 percent of the health based standards or were infrequently found but exceeded the health based standards.

When compared with surface water quality standards:

- A high level of concern exists for one chlorinated solvent (vinyl chloride), one gasoline component (benzene), four heavy metals (arsenic, barium, lead, and mercury), one light metal (aluminum), four other ions (chloride, cyanide, ammonia, and sulfate), one pesticide (gamma chlordane), two phenolics (3-,4-methylphenol, phenol), one phthalate (bis(2-ethylhexyl)phthalate), seven trace elements (boron, copper, iron, manganese, phosphorus, selenium, and zinc), and TDS. The maximum detected concentration for these parameters exceeded the surface water quality standards from 4.7 times (cyanide and chloride) to 2,323 times (iron).

- A moderate level of concern exists for one chlorinated solvent (methylene chloride), one gasoline component (toluene), three heavy metals (antimony, nickel, and thallium), one light metal (vanadium), one non-chlorinated solvent (carbon disulfide), one PAH (naphthalene), two pesticides (alpha chlordane and pentachlorophenol), and two trace elements (chromium and cobalt). These parameters were less likely to exceed the surface water quality standards when detected in C&DD leachate. However, they can be considered typical parameters in C&DD leachate and had maximum concentrations detected were from 1.1 times (toluene) to 6.5 times (vanadium) the surface water quality standards.

  Methylene chloride could have been assigned a high level of concern because it has toxic effects and is a suspected carcinogen. However it was assigned a moderate level of concern even though the maximum detected concentration was more than 16 times the standard and the upper confidence limit was 99 percent of the standard because the parameter was detected at seven landfills and exceeded the standard at only two landfills. If additional sampling shows that methylene chloride is detected more frequently, or exceeds the surface water quality standard at more landfills, it is recommended that the level of concern be raised to "high."

  Alpha chlordane could also have been assigned a high level of concern because it persistent in the environment and causes adverse effects to aquatic life at very low concentrations. However it was assigned a moderate level of concern even though the minimum concentration detected was 98 times the standard, the maximum detected concentration 260 times the standard, and the upper confidence limit was 31 times the standard because the parameter was detected at two landfills and exceeded the standard at both. If additional sampling shows that alpha chlordane is detected more frequently, or exceeds the surface water quality standard at more landfills, it is recommended that the level of concern be raised to "high."

- Noteworthy parameters include beryllium, acenaphthene, 4,4'-DDE, 4,4'-DDT, dieldrin, heptachlor, heptachlor epoxide, 2,4-dimethylphenol, 2-methylphenol, and dibenzofuran. These parameters exceeded the surface water quality standards from 2.93 times (2-mehtylphenol) to 3,277 times (dieldrin), but were detected at between one and six C&DD landfills with less than half of the detections exceeding the surface water quality standards.

- Other parameters that are noteworthy include pH, cadmium and fluoride, because the concentrations detected exceeded 80 percent of the surface water quality standards.

The concentrations of the parameters in Ohio C&DD leachate that exceeded health based standards or surface water quality standards were such that discharge of untreated C&DD leachate to the environment is not lawful in Ohio.

As one example, the concentrations of the parameters in C&DD leachate exceeded the endangerment standards contained in Ohio EPA's Underground Injection Control Program rules (see paragraph (A) of OAC Rule 3745-37-07). The maximum concentrations detected exceeded the endangerment standards by as much as 80 times. The mean concentrations exceeded the endangerment standards by as much as 10 times.

As another example, the concentrations of the parameters in Ohio C&DD leachate exceeded the surface water quality standards rules found in OAC Chapter 3745-1. The maximum concentrations detected exceeded the surface water quality standards by as much as much as 2,323 times. The mean concentrations for each parameter exceeded the surface water quality standards by as much as 79 times.

The concentrations of the parameters in Ohio C&DD leachate that exceeded SMCLs were such that discharge of the leachate with maximum concentrations of parameters (exceeding SMCLs by as much as 2,323 times) or the mean concentrations of parameters (exceeding SMCLs by as much as 79 times) could render good quality ground water objectionable or unusable for consumption, washing, and industrial production without installing treatment equipment.

Two of twenty parameters were not sampled by Ohio EPA during the 2007 leachate sampling event that were identified by Ohio EPA as indicating impact to ground water from C&DD landfills in the 2008 "Hydrogeologic Evaluation of Construction and Demolition Debris (C&DD) landfills in Ohio." All of the remaining 18 parameters were detected in Ohio C&DD leachate during the Ohio EPA 2007 C&DD leachate sampling event. The presence, frequency, and concentrations of these parameters in the Ohio C&DD leachate support the plausibility of the finding by Ohio EPA that there are indications that Ohio C&DD leachate may have impacted ground water at 31 Ohio C&DD landfills.

Conclusions

The leachate from all 30 C&DD landfills had from 3 to 29 parameters with concentrations that exceeded health based standards, surface water quality standards, or both. The median was 12.5 parameters exceeding the standards. The leachate from 29 of the 30 C&DD landfills had eight or more parameters that exceeded the standards.

The highest level of concern from Ohio C&DD leachate due to health based standards is for vinyl chloride, benzene, arsenic, lead, strontium, 3-,4-methylphenol, bis(2-ethylhexyl)phthalate, boron and manganese.

The highest level of concern from Ohio C&DD leachate due to surface water quality standards is for vinyl chloride, benzene, arsenic, barium, lead, mercury, aluminum, chloride, cyanide, ammonia, sulfate, gamma chlordane, 3-,4-methylphenol, phenol, bis(2-ethylhexyl)phthalate), boron, copper, iron, manganese, phosphorus, selenium, zinc, and TDS.

A wide variety of metals and inorganic parameters were detected including heavy metals, light metals, trace elements, and other ions. A wide variety of organic parameters were detected, including pesticides, chlorinated solvents, non-chlorinated solvents, gasoline, substituted benzenes, phenolics, chlorofluorocarbons, PAHs, phthalates, substituted alkanes, and alcohols.

The wide variety of parameters detected, and the wide variation in the number and concentration of parameters that exceeded health based standards or surface water quality standards from landfill to landfill are evidence that C&DD is not harmless or inert. It is also evidence that it is difficult to predict which of the detected parameters will be present and at what concentrations at any given C&DD landfill. This is consistent with the variety of sources for C&DD that include building materials and contaminants applied to buildings and soils (such as pesticides, wood preservatives, and paints) from any type of structures including roads, bridges, residential buildings, commercial buildings, manufacturing buildings, agricultural buildings, medical buildings and laboratories, etc.

There were numerous parameters that were often detected in Ohio C&DD leachate of sufficient concentration that would violate discharge limits of Ohio rules if released to ground water or surface water. They could also cause or contribute to water pollution, and could adversely impact downgradient or downstream residential and public drinking water supplies. Of particular concern are those parameters that were found in C&DD leachate that were multiples of the health based standards (such as arsenic, boron, manganese, and lead), carcinogens (such as arsenic, vinyl chloride, and benzene), mobile in the environment (such as arsenic, vinyl chloride, and benzene), persistent in the environment (such as antimony and lead), or which bioaccumulate (such as arsenic, copper, lead, mercury, nickel, and zinc).

The concentrations of the parameters in Ohio C&DD leachate that exceeded SMCLs were such that discharge of the leachate with the average concentrations of parameters could render good quality ground water objectionable or unusable for consumption, washing, and industrial production without installing treatment equipment.

As a result, leachate from C&DD landfills poses a threat to public health and the environment if released to ground water or surface water. The threat is posed by a variety of organic parameters, metals, and inorganic parameters. The degree of risk associated with the threat by a release will be dependant upon how the C&DD was disposed, site conditions, and circumstances surrounding the site, which often change over time. This conclusion is supported by studies showing that impacts by C&DD landfills to surface water and ground water have occurred or were indicated (US EPA, Draft 1995b), (Hamilton County General Health District, 2001), (Townsend, Jambeck, & Clark, 2002), and (Ohio EPA, 2008).

Similarities and Differences with Cited Works

Based on historical information, such as the sources cited in the introduction (see especially (US EPA, Draft 1995a)), it was expected that approximately 90 parameters would be detected; 95 were detected. It was also expected that metals and inorganic parameters would be the primary constituents detected in Ohio's C&DD leachate; with approximately 55 of the 90 parameters being metals and inorganic compounds. However, the results from Ohio EPA's leachate analysis showed only 36 metals and inorganic parameters were detected, which was lower than expected. It was also expected that approximately 35 organic parameters would be detected in Ohio's C&DD leachate. However, a wide variety of 59 organic parameters were detected. It was surprising that pesticides, chlorinated solvents, non-chlorinated solvents, and gasoline would be such a large proportion (42 percent) of parameters detected when compared with the proportion of metals and inorganic parameters detected (38 percent).

With a few exceptions, the pH, TDS, COD, and total alkalinity of Ohio C&DD leachate were similar to findings in the literature for other states as described in the sources summarized in the introduction (Townsend, Jang, & Thurn, 1999).

Based on historical information, such as the sources referenced in the introduction it, was expected that approximately 18 metals and inorganic parameters would exceed the health based standards; 19 did. It was expected that approximately six organic parameters would exceed health based standards at one or more landfills; eight did. These results were comparable with the results of the study published by U.S. EPA in 1995 titled, "Construction and Demolition Waste Landfills" paper cited in the introduction.

Based on historical information, such as the sources referenced in the introduction, it was expected that approximately 12 metals and inorganic parameters would exceed the surface water quality standards; 24 did. Few organic parameters were expected to exceed surface water quality standards; 21 did. These results are higher than expected.

The 1995 study published by U.S. EPA titled, "Damage Cases: Construction and Demolition Waste Landfills" cited in the introduction indicated that aluminum, antimony, cadmium, copper, iron, lead, pH, TDS, vanadium, zinc and occasional PAHs were found to have caused surface water contamination. Many of these same parameters were detected in Ohio C&DD leachate in excess of the surface water quality standards. In addition, 35 other parameters were also found to exceed surface water quality standards in Ohio C&DD leachate.

The 2002 study published by Townsend et al. found that Aluminum, TDS, Sulfate, ammonia, iron, cadmium, lead, phenols, bromodichloromethane, chloride, nitrate, benzene, chromium, copper, ph sodium, arsenic, methyl bromide, trichloromethane, mercury, dibromochloromethane and turbidity exceeded ground water cleanup target levels downgradient of between 3 and 17 C&DD landfills in Florida (Townsend, Jambeck, & Clark, 2002). Many of these parameters were detected in Ohio C&DD leachate and were indicated as possibly impacting ground water at one to 14 Ohio C&DD landfills.

In addition, the literature generally indicates that the parameters of concern in C&DD leachate are 1,2-dichloroethane, methylene chloride, arsenic, barium, cadmium, chromium, lead, mercury, zinc, boron, chloride, cyanide, iron, manganese, nitrate, nitrite, pH, sodium, sulfate, and TDS (Townsend & Kibert, 1998).

The parameters of concern in Ohio C&DD leachate that matched those identified in the literature as stated above included methylene chloride, arsenic, barium, cadmium, chromium, lead, mercury, zinc, boron, chloride, cyanide, iron, manganese, pH, sulfate, sodium, and TDS

However, 1,2-dichloroethane, nitrate, and nitrite were not found to be of concern in Ohio C&DD leachate, but were listed as parameters of concern in the literature. Another difference between the literature and this report is that there were 22 additional parameters in Ohio C&DD Leachate that were of moderate or high level of concern including vinyl chloride, benzene, aluminum, ammonia, chlordane, 3-,4-methylphenol, phenol, bis(2-ethylhexyl)phthalate, copper, phosphorus, selenium, strontium, toluene, antimony, beryllium, nickel, thallium, vanadium, carbon disulfide, naphthalene, pentachlorphenol, and cobalt.

As discussed above, the results in this report have demonstrated similarities to the cited sources. However, there were some differences in Ohio's C&DD leachate, namely the higher number and wider variety of organic parameters that were detected and a larger number of parameters that are of concern in Ohio C&DD leachate when compared with health based standards and surface water quality standards.

Future Research

Future research on this topic should focus on the following:

- Repeating the leachate sampling and revisiting the analyses included in this report to evaluate trends over time.
- Evaluating if the age, size, operations, the presence of leachate recirculation, and the type of C&DD being disposed is correlated to the type and concentration of the parameters detected.
- Comparing C&DD landfill leachate with the leachate from other types of landfills, such as municipal solid waste landfills and industrial waste landfills.
- Determining the magnitude and effects of dilution from ground water infiltration, surface water run-on, and precipitation may be having on the type and concentration of parameters detected.
- Determining the types, prevalence, and concentration of pesticides in C&DD.
- Conducting studies similar to this one and the US EPA. (Draft 1995a) construction and demolition waste landfills study in other states.

To make comparisons of different study results easier, researchers may want to consider adopting a consistent list of parameters, health based standards, surface water quality standards, and approach for comparing those parameters with the standards as additional leachate sampling is conducted in different states and different types of landfills.

Another practice that may make comparisons of different studies on C&DD leachate easier would be to include the definition of C&DD used in each study. This would be helpful because different states and the U.S. EPA appear to have somewhat different definitions.

Attachment 1 – Ohio's Definition of C&DD

OAC 3745-400-01(F) "Construction and demolition debris" or "debris" means those materials resulting from the alteration, construction, destruction, rehabilitation, or repair of any manmade physical structure, including, without limitation, houses, buildings, industrial or commercial landfills, or roadways. "Construction and demolition debris" does not include materials identified or listed as solid wastes, infectious wastes, or hazardous wastes pursuant to Chapter 3734. of the Revised Code and rules adopted under it; or materials from mining operations, nontoxic fly ash, spent nontoxic foundry sand, and slag; or reinforced or nonreinforced concrete, asphalt, building or paving brick, or building or paving stone that is stored for a period of less than two years for recycling into a usable construction material.

For the purpose of this definition, "materials resulting from the alteration, construction, destruction, rehabilitation, or repair of any manmade physical structure," are those structural and functional materials comprising the structure and surrounding site improvements, such as brick, concrete and other masonry materials, stone, glass, wall coverings, plaster, drywall, framing and finishing lumber, roofing materials, plumbing fixtures, heating equipment, electrical wiring and components containing no hazardous fluids or refrigerants, insulation, wall-to-wall carpeting, asphaltic substances, metals incidental to any of the above, and weathered railroad ties and utility poles.

"Materials resulting from the alteration, construction, destruction, rehabilitation, or repair" do not include materials whose removal has been required prior to demolition, and materials which are otherwise contained within or exist outside the structure such as solid wastes, yard wastes, furniture, and appliances. Also excluded in all cases are liquids including containerized or bulk liquids, fuel tanks, drums and other closed or filled containers, tires, and batteries.

Asbestos can be authorized to be disposed in Ohio's C&DD landfills: ORC Section 3714.13(E) states that, No owner or operator of a construction or demolition debris landfill shall dispose of asbestos or regulated asbestos-containing materials or products at the landfill unless the owner or operator is specifically authorized to do so by the board of health of the health district in which the landfill is located, or by the director, pursuant to rules adopted under division (D) of section 3714.02 of the Revised Code.

Acceptance and disposal of pulverized debris at Ohio C&DD landfills is prohibited: ORC Section 3714.01(I) states that, "Pulverized debris" means a load of debris that, after demolition has occurred, but prior to acceptance of the load of debris for disposal, has been shredded, crushed, ground, or otherwise rendered to such an extent that the load of debris is unidentifiable as construction and demolition debris.

Disposal of solid waste is prohibited: OAC Rule 3745-27-01(S)(23) states that, "Solid waste" means such unwanted residual solid or semisolid material, including but not limited to, garbage, scrap tires, combustible and noncombustible material, street dirt and debris, as results from industrial, commercial, agricultural, and community operations, excluding earth or material from construction, mining, or demolition operations, or other waste materials of the type that normally would be included in demolition debris, nontoxic fly ash and bottom ash, including at least ash that results from combustion of coal, biomass fuels, and ash that results from the combustion of coal in combination with scrap tires where scrap tires comprise not more than fifty per cent of heat input in any month, spent nontoxic foundry sand, and slag and other substances that are not harmful or inimical to public health, and includes, but is not limited to, garbage, scrap tires, combustible and noncombustible material, street dirt, and debris. Solid waste does not include any material that is an infectious waste or a hazardous waste.

Attachment 2 – C&DD Constituent List

The constituent list for the statewide C&DD leachate sampling project included the following:

1. All constituents and parameters listed in OAC Rule 3745-27-10 Appendix I and Appendix II (attached) except ethyl methanesulfonate, CAS# 62-50-0 (Appendix II #114).
2. Seven additional volatile or semivolatile organic compounds not included in OAC Rule 3745-27-10 Appendix I or Appendix II: isopropyl benzene (cumene) (CAS# 98-82-8) 4-isopropyltoluene (p-cymene) (99-87-6) n-propylbenzene (103-65-1) tert-butylbenzene (98-06-6) 1,2,3-trichlorobenzene (87-61-6) 1,2,4-trimethylbenzene (95-63-6) 1,3,5-trimethylbenzene (108-67-8)
3. Organophosphorous pesticides not included in OAC Rule 3745-27-10 Appendix I or Appendix II, please refer to the list provided in attached description of U.S. EPA SW-846 method 8141a.
4. The following inorganic constituents and parameters not included in OAC Rule 3745-27-10 Appendix I or Appendix II: aluminum, boron, strontium, fluoride, phosphorous, COD

The following analytical methods were used:

- Volatile organic compounds, SW-846 8260 A9
- Semivolatile organic compounds, SW-8270 A9
- Herbicides, SW-846 8151
- Pesticides/PCBs, SW-846 8081/8082
- Organophosphorous pesticides, 827 OP (equivalent to SW-846 8141a) metals and free cyanide, SW-846 6010/6020, except for mercury which is SW-646 7471
- Ammonia-nitrogen, U.S. EPA 350.1 or SM-4500
- Nitrate-nitrite, U.S. EPA 353.2 or SM-4500
- COD, U.S. EPA 410.4 or SM-5220-D
- Phosphorous, U.S. EPA 365.4
- Fluoride, SM-4500-FC
- Sulfate, U.S. EPA 375.4 or SM-426-C
- Chloride, U.S. EPA 325.2
- TDS, U.S. EPA 160.1 or SM-2540-C
- Sulfide, U.S. EPA 376.1 or SM-4500-SF
- Total alkalinity, U.S. EPA 310.2

Samples were analyzed for both total and dissolved metals; the list of metals includes the following constituents: aluminum, strontium, boron, antimony, arsenic, barium, beryllium, cadmium, chromium, cobalt, copper, lead, nickel, selenium, silver, thallium, vanadium, zinc, sodium, potassium, magnesium, calcium, iron, manganese, mercury, tin.

The constituents and parameters analyzed in C&DD leachate included all constituents and parameters for C&DD landfill ground water monitoring under the draft 2006 C&DD rules.

Attachment 3 - Ohio Administrative Code Rule 3745-27-10, Appendix I

APPENDIX I

Compound	CAS RN2
1) Antimony	See note 3
2) Arsenic	See note 3
3) Barium	See note 3
4) Beryllium	See note 3
5) Cadmium	See note 3
6) Chromium	See note 3
7) Cobalt	See note 3
8) Copper	See note 3
9) Lead	See note 3
10) Nickel	See note 3
11) Selenium	See note 3
12) Silver	See note 3
13) Thallium	See note 3
14) Vanadium	See note 3
15) Zinc	See note 3
16) Acetone	67-64-1
17) Acrylonitrile	107-13-1
18) Benzene	71-43-2
19) Bromocholoromethane	74-97-5
20) Bromodicholoromethane	75-27-4
21) Bromoform; Tribromomethane	75-25-2
22) Carbon disulfide	75-15-0
23) Carbon tetrachloride	56-23-5
24) Chlorobenzene	108-90-7
25) Chloroethane; Ethyl cloride	75-00-3
26) Chloroform; Trichloromethane	67-66-3
27) Dibromochloromethane; Chlorodibromomethane	124-48-1
28) 1,2-Dibromo-3-chloropropane; DBCP	96-12-8
29) 1,2 Dibromoethane;Ethylene dibromide;EDB	106-93-4
30) o-Dichlorobenzene; 1,2-Dichlorobenzene	95-50-1
31) p-Dichlorobenzene; 1,4-Dichlorobenzene	106-46-7
32) trans-1,4-Dichloro-2-butene	110-57-6
33) 1,1-Dichloroethane; Ethylidene chloride	75-34-3
34) 1,2-Dichloroethane; Ethylidene dichloride	107-06-2
35)1,1-Dichloroethylene; 1,1-Dichloro-ethene;Vinylidene chloride	75-35-4
36) cis-1,2-Dichlorothylene; cis-1,2-Dichloro-ethane	156-59-2
37) trans-1,2-Dichloroethylene; trans-1,2-Dichloro-ethene	156-60-5
38) 1,2-Dichloropropane; Propylene dichloride	78-87-5
39) cis-1,3-Dichloropropene	10061-01-5
40) trans-1,3-Dichloropropene	10061-02-6
41) Ethylbenzene	100-41-4
42) 2-Hexanone; Methyl butyl ketone	591-78-6
43) Methyl bromide; Bromomethane	74-83-9
44) Methyl chloride; Chloromethane	74-87-3
45) Methylene bromide; Dibromomethane	74-95-3
46) Methylene chloride; Dichloromethane	75-09-2

47) Methyl ethyl ketone; MEK; 2-Butanone 78-93-3
48) Methyl iodide; iodomethane 74-88-4
49) 4-Methyl-2-pentanone; Methyl isobutyl ketone . . 108-10-1
50) Styrene. 100-42-5
51) 1,1,1,2-Tetrachloroethane. 630-20-6
52) 1,1,2,2-Tetrachloroethane. 79-34-5
53) Tetrachloroethylene; Tetrachloroethene; Perchloroethylene 127-18-4
54) Toluene. 108-88-3
55) 1,1,1-Trichloroethane; Methylchloroform. 71-55-6
56) 1,1,2-Trichloroethane. 79-00-5
57) Trichloroethylene; Trichloroethene 79-01-6
58) Trichloroflouromethane; CFC-11 75-69-4
59) 1,2,3-Trichloropropane 96-18-4
60) Vinyl acetate. 108-05-4
61) Vinyl chloride 75-01-4
62) Xylenes. . . . . See note 4
63) Ammonia
64) Chloride
65) Sodium
66) Potassium
67) Temperature
68) pH
69) Specific conductance
70) TDS
71) Total alkalinity
72) Nitrate-nitrite
73) Sulfate
74) Magnesium
75) Calcium
76) Turbidity
77) Iron
78) Manganese

Note 1. Common names are those widely used in government rules, scientific publications, and commerce; synonyms exist for many chemicals.

Note 2. Chemical Abstract Service registry number.

Note 3. Analysis for these compounds shall be representative of the quality background ground water that has not been affected by past or present operations at the sanitary landfill landfill and representative of the quality of ground water passing directly downgradient of the limits of solid waste placement.

Note 4. Xylene (total): this entry includes o-xylene (CAS RN 96-47-6), m-xylene (CAS RN 108-38-3), p-xylene (CAS RN 106-42-3), and unspecified xylenes (dimethylbenzenes) (CAS RN 1330-20-7).

Attachment 4 – OAC Rule 3745-27-10, Appendix II

APPENDIX II

Compound	CAS RN2
1) Acenaphthene; 1,2-Dihydroacenaphthylene	83-32-9
2) Acenaphthylene	208-96-8
3) Acetone;2-Propanone	67-64-1
4) Acetonitrile; Methyl cyanide	75-05-8
5) Acetophenone; 1-Phenylethanone	98-86-2
6) 2-Acetylaminoflourene; 2-AAF; N-9H-flouren-2-yl-acetamide	53-96-3
7) Acrolein; 2-Propenal	107-02-8
8) Acrylonitrile; 2-Propenenitrile	107-13-1
9) Aldrin; 1,2,3,4,10,10-hexachlora-1,4,4a,5,8,8ahexahydro(1a,4a,4ab,5a,8a,8ab)-1,4:5,8- Dimethanonaphthalene.	309-00-23
10) Allyl chloride; 3-Chloro-1-propene	107-05-1
11) 4-Aminobiphenyl; [1,1'-Biphenyl]-4-amine	92-67-1
12) Anthracene	120-12-7
13) Antimony	See note 4
14) Arsenic	See note 4
15) Barium	See note 4
16) Benzene	71-43-2
17) Benzo[a]anthracene; Benzanthracene	56-55-3
18) Benzo[b]flouranthene; Benz[e]acephenanthylene	205-99-2
19) Benzo[k]flouranthene	207-08-9
20) Benzo[ghi]perylene	191-24-2
21) Benzo[a]pyrene	50-32-8
22) Benzyl alcohol; Benzenemethanol	100-51-6
23) Beryllium	See note 4
24) alpha-BHC; 1,2,3,4,5,6-Hexachlorocyclohexane, (1a,2a,3b,4a,5b,6b)	319-84-63
25) beta-BHC; 1,2,3,4,5,6-Hexachlorocyclohexane, (1a,2b,3a,4b,5a,6b)	319-85-73
26) delta-BHC; 1,2,3,4,5,6-Hexachlorocyclohexane, (1a,2a,3a,4b,5a,6b)	319-86-83
27) gamma-BHC; Lindane; 1,2,3,4,5,6-Hexachlorocyclo hexane,(1a,2a,3b,4a,5a,6b)	58-89-93
28) bis(2-Chloroethoxy)methane; 1,1'-[methylenebis(oxy)] bis[2-chloroethane]	111-91-1
29) bis(2-Chloroethyl) ether; Dichloroethyl ether; 1,1'-oxybis[2-Chloroethane]	111-44-4
30) bis-(2-Chloro-1-methylethyl) Ether; 2,2'-Dichlorodiisopropyl ether; DCIP; 2,2'-oxybis[1-Chloropropane]	108-60-15
31) bis(2-Ethylhexyl) Phthalate; 1,2-Benzenedicarboxylic acid, bis(2-Ethylhexyl) ester.	117-81-7
32) Bromochloromethane; Chlorobromomethane	74-97-5
33) Bromodichloromethane; Dibromochloromethane	75-27-4
34) Bromoform; Tribromomethane	75-25-2
35) 4-Bromophenyl phenyl ether; 1-Bromo-4-phenoxy-benzene	101-55-3
36) Butyl benzyl phthalate; Benzyl butyl phthalate; 1,2-Benzenedicarboxylic acid, Butyl phenylmethyl ester	85-68-7
37) Cadmium	See note 4
38) Carbon disulfide	75-15-0
39) Carbon tetrachloride; Tetrachloromethane	56-23-5
40) Chlordane; 1,2,4,5,6,8,8-octochloro-2,3,3a,4,7,7ahexahydro-	

4,7-methano-1H-indene . . . . . See note 6
41) p-Chloroaniline; 4-Chlorobenzenamine 106-47-8
42) Chlorobenzene 108-90-7
43) Chlorobenzilate; 4-Chloro-a-(4-Chlorophenyl)-a-Hydroxybenzeneacetic acid, Ethyl ester 510-15-6
44) p-Chloro-m-Cresol; 4-Chloro-3-Methylphenol 59-50-7
45) Chloroethane; Ethyl chloride 75-00-3
46) Chloroform; Trichloromethane 67-66-3
47) 2-Chloronaphthalene 91-58-7
48) 2-Chlorophenol 95-57-8
49) 4-Chlorophenyl phenyl ether; 1-Chloro-4-phenoxy benzene ...7005-72-3
50) Chloroprene; 2-Chloro-1,3-butadiene 126-99-8
51) Chromium ..... See note 4
52) Chrysene 218-01-9
53) Cobalt ..... See note 4
54) Copper ..... See note 4
55) m-Cresol; 3-Methylphenol 108-39-4
56) o-Cresol; 2-Methylphenol 95-48-7
57) p-Cresol; 4-Methylphenol 106-44-5
58) Cyanide 57-12-5
59) 2,4-D; 2,4-Dichlorophenoxyacetic acid 94-75-7
60) 4,4'-DDD; 1,1'-(2,2-Dichloroethylidene)bis [4-chlorobenzene] 72-54-8
61) 4,4'-DDE; 1,1'-(2,2-Dichloroethyenylidene)bis [4-chlorobenzene] 72-55-9
62) 4,4'-DDT; 1,1'-(2,2,2-Trichloroethylidene)bis [4-chlorobenzene] 50-29-3
63) Diallate; bis(1-Methylethyl)-carbamothoic acid S-(2,3-Dichloro-2-propenyl) ester 2303-16-4
64) Dibenz[a,h]anthracene 53-70-3
65) Dibenzofuran 132-64-9
66) Dibromocholormethane; Chlorodibromomethane 124-48-1
67) 1,2-Dibromo-3-chloropropane; DBCP 96-12-8
68) 1,2-Dibromoethane; Ethylene dribromide; EDB 106-93-4
69) Di-n-butyl phthalate; 1,2-Benzenedicarboxylic acid dibutyl ester 84-74-2
70) o-Dichlorobenzene; 1,2-Dichlorobenzene 95-50-1
71) m-Dichlorobenzene; 1,3-Dichlorobenzene 541-73-1
72) p-Dichlorobenzene; 1,4-Dichlorobenzene 106-46-7
73) 3,3'-Dichlorobenzidine; 3,3'-Dichloro-[1,1'-bi phenyl]-4,4'-diamine 91-94-1
74) trans-1,4-Dichloro-2-butene 110-57-6
75) Dichlorodifluoromethane; CFC 12 75-71-8
76) 1,1-Dichloroethane; Ethylidene chloride 75-34-3
77) 1,2-Dichloroethane; Ethylene dichloride 107-06-2
78) 1,1-Dichloroethylene; 1,1-Dichloroethene; Vinylidene chloride 75-35-4
79) cis-1,2-Dichloroethylene; cis-1,2-Dichloroethene 156-59-2
80) trans-1,2-Dichloroethylene; trans-1,2-Dichloro ethane 156-60-5
81) 2,4-Dichlorophenol 120-83-2
82) 2,6-Dichlorophenol 87-65-0
83) 1,2-Dichloropropane; Propylene dichloride 78-87-5
84) 1,3-Dichloropropane; Trimethylene dichloride 142-28-9
85) 2,2-Dichloropropane; Isopropylidene chloride 594-20-7
86) 1,1-Dichloropropene; 1,1-Dichloro-1-propene 563-58-6

87) cis-1,3-Dichloropropene; 10061-01-5
88) trans-1,3-Dichloropropene 10061-02-6
89) Dieldrin; 3,4,5,6,9,9-Hexachloro-1a,2,2a,3,6,6a,
7,7a-octahydro-2,7:3,6-dimethanonaphthalene
[2,3-b]oxirene, (1aa,2b,2aa,3b,6b,6aa,7b,7aa). 60-57-13
90) Diethyl phthalate; 1,2-Benzenedicarboxylic
acid, Diethyl ester 84-66-2
91) O,O-Diethyl O-2-Pyrazinyl phosphorothioate; Thionazin . . . 297-97-2
92) Dimethoate; Phosphorodithoic acid O,O-Dimethyl-S-
[2-(methylamino)-2-oxoethyl] ester 60-51-5
93) p-(Dimethylamino)azobenzene; N,N-Dimethyl-4-
(phenylazo)benzenamine 60-11-7
94) 7,12-Dimethylbenz[a]anthracene 57-97-6
95) 3,3'-Dimethylbenzidene; 3,3'-Dimethyl[1,1'bi
phenyl]-4,4'-diamine 119-93-7
96) 2,4-Dimethylphenol; m-Xylenol 105-67-9
97) Dimethyl phthalate; 1,2-Benzenedicarboxylic
acid, dimethyl ester 131-11-3
98) m-Dinitrobenzene 99-65-0
99) 4,6-Dinitro-o-cresol; 4,6-Dinitro-2-methylphenol;
2-Methyl-4,6-dinitrophenol 534-52-1
100) 2,4-Dinitrophenol 51-28-5
101) 2,4-Dinitrotoluene; 1-Methyl-2,4-dinitrobenzene 121-14-2
102) 2,6-Dinitrotoluene; 2-Methyl-1,3-dinitrobenzene 606-20-2
103) Dinoseb; DMBP; 2-sec-Butyl-4,6-dinitrophenol;
2-(1-Methylpropyl)-4,5-dinitrophenol 88-85-7
104) Di-n-octyl phthalate; 1,2-Benzenedicarboxylic
acid, Dioctyl ester. 117-84-0
105) Diphenylamine; N-phenylbenzenamine 122-39-4
106) Disulfoton; Phosphorodithioic acid O,O-diethyl
S-[2-(ethylthio)ethyl] ester 298-04-4
107) Endosulfan I; 6,7,8,9,10,10-Hexachloro-1,5,5a,6,9,
9a-hexahydro-6,9-methano-2,4,3-benzodioxa thiepin,
3-oxide 959-98-8
108) Endosulfan II; 6,7,8,9,10,10-Hexachloro-1,5,5a,6,9,
9a-hexahydro-6,9-methano-2,4,3-benzodioxa
thiepin, 3-oxide (3a,5aa,6b,9b,9aa) 33213-65-93
109) Endosulfan sulfate; 6,7,8,9,10,10-hexachloro-1,5,5a,6,9,
9a-hexahydro-6,9-methano-2,4,3-benzodioxa
thiepin, 3-3-dioxide 1031-07-8
110) Endrin; 3,4,5,6,9,9-hexachloro-1a,2,2a,3,6,6a,7,7aoctahydro-
2,7:3,6-dimethanonaphth[2,3-
b]oxirene, (1aa,2b,2ab,3a,6a,6ab,7b,7aa) 72-20-83
111) Endrin aldehyde; 2,2a,3,3,4,7-hexachlorodecahydro-
1,2,4-methenocyclopenta[cd]pentalene-5-carboxaldehyde,
(1a,2b,2ab,4b,4ab,5b,6ab,6bb,7r*) 7421-93-43
112) Ethylbenzene 100-41-4
113) Ethyl methacrylate; 2-Methyl-2-propenoic acid, ehtyl
Ester 97-63-2
114) Ethyl methanesulfonate; Methanesulfonic acid, ethyl
Ester 62-50-0
115) Famphur; Phosphorothioic acid, O-[4-[(dimethylamino)
sulfonyl]phenyl]O,O-dimethyl ester 52-85-7
116) Flouranthene 206-44-0
117) Flourene; 9H-flourene 86-73-7

118) Heptachlor; 1,4,5,6,7,8,8-heptachloro-3a,4,7,7atetrahydro-4,7-methano-1H-indene 76-44-8
119) Heptachlor epoxide; 2,3,4,5,6,7,7-Heptachloro-1a,1b,5,5a,6,6a-hexahydro-2,5-methano-2h-indeno[1,2-b]oxirene, (1aa,1bb,2a,5a,5ab,6b,6aa) 1024-57-33
120) Hexachorobenzene 118-74-1
121) Hexachlorobutadiene; 1,1,2,3,4,4-Hexachloro-1,3-butadiene . 87-68-3
122) Hexachlorocyclopentadiene; 1,2,3,4,5,5-Hexachloro-1,3-cyclopentadiene 77-47-4
123) Hexachloroethane 67-72-1
124) Hexachloropropene; 1,1,2,3,3,3-Hexachloro-1-propene . . . 1888-71-7
125) 2-Hexanone; Methyl butyl ketone 591-78-6
126) Indeno(1,2,3-cd)pyrene 193-39-5
127) Isobutyl alcohol;2-Methyl-1-propanol 78-83-1
128) Isodrin; 1,2,3,4,10,10-Hexachloro-1,4,4a,5,8,8ahexahydro-1,4,5,8-dimethanonaphthalene,(1a,4a,4ab,5b,8b,8ab) 465-73-63
129) Isophorone; 3,5,5-Trimethyl-2-cyclohexen-1-one 78-59-1
130) Isosafrole; 5-(1-Propenyl)-1,3-benzodioxole 120-58-1
131) Kepone; 1,1a,3,3a,4,5,5a,5b,6-decachlorocta hydro-1,3,4-methano-2H-cyclobuta[cd9]pentalen-2-one 143-50-0
132) Lead . . . . . See note 4
133) Mercury . . . . . See note 4
134) Methacrylonitrile; 2-Methyl-2-propenenitrile 126-98-7
135) Methapyrilene; N,N-dimethyl-N'-2-pyridinyl-N'-(1/2-thienylmethyl)-1,2-ethanediamine 91-80-5
136) Methoxychlor; 1,1'-(2,2,2-Trichloroethylidene)bis[4-Methoxybenzene] 72-43-5
137) Methyl bromide; Bromomethane 74-83-9
138) Methyl chloride; Chloromethane 74-87-3
139) 3-Methylcholanthrene; 1,2-Dihydro-3-methylbenze[j]aceanthrylene 56-49-5
140) Methyl ethyl ketone; MEK; 2-Butanone 78-93-3
141) Methyl iodide; Iodomethane 74-88-4
142) Methyl methacrylate; 2-Methyl-2-propenoic acid, methyl Ester 80-62-6
143) Methyl methanesulfonate; Methanesulfonic acid, methyl Ester 66-27-3
144) 2-Methylnaphthalene 91-57-6
145) Methyl parathion; Parathion methyl; Phosphorothioic acid, O,O-dimethyl O-(4-nitrophenyl) ester 298-00-0
146) 4-Methyl-2-pentanone; Methyl isobutyl ketone 108-10-1
147) Methylene bromide; Dibromomethane 74-95-3
148) Methylene chloride; Dichloromethane 75-09-2
149) Naphthalene 91-20-3
150) 1,4-Naphthoquinone; 1,4-Naphthalenedione 130-15-4
151) 1-Naphthylamine; 1-Naphthalenamine 134-32-7

203) Trichlorofluoromethane; CFC-11 75-69-4
204) 2,4,5-Trichlorophenol 95-95-4
205) 2,4,6-Trichlorophenol 88-06-2
206) 1,2,3-Trichloropropane 96-18-4

207) o,o,o-Triethyl phosphorothioate; Phosphorothioic acid, o,o,o-triethyl ester 126-68-1
208) sym-Trinitrobenzene; 1,3,5-Trinitrobenzene 99-35-4
209) Vanadium . . . . . See note 4
210) Vinyl acetate; Acetic acid, ethenyl ester 108-05-4
211) Vinyl chloride; Chloroethene 75-01-4
212) Xylene (total); Dimethylbenzene . . . . . See note 9
213) Zinc . . . . . See note 4

Note 1: Common names are those widely used in government rule, scientific publications, and commerce; synonyms exist for many chemicals.

Note 2: Chemical Abstract Service registry number. Where "total" is entered, all species in ground water that contain this element are included.

Note 3: When numbers and letters appear in this form at the end of a chemical name, i.E. (1a,4a,4aB,5a,8a,8aB), the following applies: "a" = small case "a"; "a" (italic) = alpha; "b" = small case "b"; and "B" (italic) = beta.

Note 4: Analysis for these compounds shall be representative of the quality background ground water that has not been affected by past or present operations at the sanitary landfill landfill and representative of the quality of ground water passing directly downgradient of the limits of solid waste placement.

Note 5: CAS No. 108-60-1. This substance is often called bis(2-Chloroisopropyl) ether, the name Chemical Abstracts Service applies to its commercial isomer, propane, 2,2"-oxybis[2-Chloro-(CAS RN 39638-32-9).

Note 6: Chlordane: This entry includes alpha-chlordane (CAS RN 5103-71-9), beta-Chlordane (CAS RN 5103-74-2), gamma-Chlordane (CAS RN 5566-34-7), and constituents of Chlordane (CAS RN 54-74-9 and CAS RN 12789-03-06).

Note 7: Polychlorinated biphenols (CAS RN 1336-36-3); This category contains congener chemicals, including constituents of Aroclor 1016 (CAS RN 12674-11-2), Aroclor 1221 (CAS RN 11104-28-2), Aroclor 1232 (CAS RN 11141-16-5), Aroclor 1242(CAS RN 53469-21-9), Aroclor 1248 (CAS RN 12672-29-6),Aroclor 1254 (CAS RN 11097-69-1), and Aroclor 1260 (CAS RN 11096-82-5).

Note 8: Toxaphene: This entry includes congener chemicals contained in technical toxaphene (CAS RN 8001-35-2, i.e., chlorinated camphene.

Note 9: Xylene (total): This entry includes o-xylene (CAS RN 96-47-6), m-xylene (CAS RN 108-38-3), p-xylene (CAS RN 106-42-3), and unspecified xylenes (dimethylbenzenes) (CAS RN 1330-20-7).

Attachment 5 – Sampling Methods and Materials

Collection methods included:

- A bailer was used 10 times to provide leachate for samples.
- A peristaltic pump into a stainless steel bucket was used four times to provide leachate for samples.
- A pipe leading to a leachate collection system or tank before leachate was released into a sewer system was used nine times to provide leachate for samples.
- A stainless steel bucket or pitcher to remove leachate from a leachate collection system, sump, holding tank or pond was used twenty times to provide leachate for samples.
- A stainless steel gallon bucket, stainless steel pitcher, and a stainless steel scoop were used to obtain two sediment samples. The results of the sediment samples were not included in this report, because they represented soils contaminated by the leachate that had been exposed to the environment, rather than leachate itself. Leachate samples were also obtained from the same landfill where sediment samples were collected.

The laboratory had specific collection requirements. The laboratory supplied the containers, and SIFU obtained the samples. Sample containers were secured with Teflon-lined lids. Samples were stored in ice to maintain the appropriate preservation temperature until they were received by the laboratory. Leachate collected at each landfill was distributed to the following containers as follows:

- Eight 1000 ml amber, wide-mouth bottles were used to collect the following samples:
  - Two herbicides.
  - Two semi-volatile organic compounds (SVOC) per U.S. EPA Method 8270
  - Two organophosphates.
  - One polychlorinated biphenyl (PCBs).
- Two 40 ml septum vials were used to collect volatile organic compounds (VOC) per U.S. EPA Method 8260.
- Four 250 ml high-density polyethylene-wide mouth bottles were use to collect the following samples:
  - One chloride, fluoride, and sulfate.
  - One cyanide, weak and dissociable.
  - One TDS.
  - One total alkalinity.
- 500 ml high-density polyethylene-wide mouth bottles were use to collect the following samples:
  - One total metals.
  - One dissolved metals.
  - One sulfide.
- 250ml glass bottle was used to collect COD, ammonia, nitrate, nitrite, and phosphate.
- One 250ml wide-mouth bottle was used to collect pesticides; PCBs; herbicides; Organophosphates; and VOCs.
- One 125 ml wide-mouth bottle was used to collect each sediment sample for the analysis of cyanide, metals, and percent solids.

OHIO EPA DIVISION OF SOLID AND INFECTIOUS WASTE MANAGEMENT
C&DD LEACHATE SAMPLING STATEWIDE INITIATIVE

Site Name

STATEMENT OF PURPOSE

This statewide sampling initiative will provide a comprehensive and representative sampling, analysis, and chemical characterization of leachate generated by Ohio's construction and demolition debris (C&DD) landfill landfills. The data will be used to support and develop revisions to Ohio's C&DD landfill rules under H.B. 397.

SECTION I - General Information and Personnel

Site Name: **Date(s) of Investigations:** TBD

District: **County:** **Core ID No:**

Site Address/Location:

Directions to Site: See attached map.

Latitude: **Longitude:**

Team Members and Responsibilities:

, Project Manager

, Sampling Team Leader

, Site Health and Safety Officer

, Sampling Team Member; Alternate Health and Safety Officer

Prepared by: **Date:**

SECTION II - Site Description

SECTION III - Sampling Strategy and Methods

Samples collected during the course of this investigation will be sent to Kemron Environmental Services and may include the following analysis: volatile organic analysis (VOA-8260 A9); semi-volatile organic compounds (SVOC-8270 A9); pesticides/PCB's (8081,8082); organophosphorous (OP) pesticides (827 OP); Target Analyte List (TAL) metals and strontium, tin, and boron, both total and dissolved; chloride (Cl); fluoride (F); COD; free cyanide (CN); ammonia-nitrogen (NH_3); nitrate – nitrite ($NO_3 - NO_2$); sulfate (SO_4); sulfide (S); total alkalinity; TDS ; and total phosphorous (P).

Leachate Samples: At least one leachate sample will be collected at the landfill if the landfill has a leachate collection system or if an active leachate seep is present. This number of leachate samples collected will depend on landfill conditions, including but not necessarily limited to the number of potential sampling locations, the ability to safely access each location, and the ability to collect a representative sample at each location. Additionally, at least one duplicate sample will be collected per day of sampling and for every 10 field samples. A trip blank, provided by the laboratory, will accompany all VOA samples and be analyzed. At the request of the site owner, split samples may also be collected and given to the site owner for private analysis.

The leachate samples will be collected as close to the leachate source as possible and may include, as available, leachate tanks, sumps, wells, trenches, seeps, and other potential locations, such as an observed release to a surface water body or other receptor.

Field parameters that will be collected prior to sampling include temperature, pH, conductivity and turbidity. Field monitoring equipment will be calibrated per the manufacturer's recommendations before use.

All leachate samples, duplicates, and blanks will be collected in the appropriate containers as supplied or required by the laboratory. The samples will be preserved as required by the method and laboratory.

Sediment/Soil Samples: Sediment and/or soil samples may be collected as deemed necessary in the field. Situations that may require the collection of sediment/soil samples include leachate seeps or the accumulation of sediments in leachate collection systems. Duplicate samples will be collected at the rate of one for every 10 field samples.

Prior to submitting sediment and/or soil samples to the laboratory for analyses, DSIWM CMEU will be notified for final concurrence.

All sediment or soil samples, duplicates, and blanks will be collected in the appropriate containers as supplied or required by the laboratory. The samples will be preserved as required by the method and laboratory.

Procedures:
Personal protective procedures, sample collection, sample screening and field decontamination will all be performed according to Ohio EPA-DERR's *standard Operating Procedures*, 2007.

In the event of insufficient sample volume for a complete analysis, sample bottles will be filled in the following order: 1. VOCs 2. total metals 3. SVOCs (if insufficient sample for SVOCs, skip to #4 and continue) 4. pesticides/PCBs (if insufficient sample for pesticides/PCBs, skip to #5 and continue) 5. OP pesticides (if insufficient sample for OP pesticides, skip to #6 and continue) 6. free cyanide 7. nitrate-nitrite 8. fluoride 9. total phosphorous 10. ammonia-nitrogen 11. sulfate 12. chloride 13. TDS 14. sulfide 15. dissolved metals 16. total alkalinity 17. COD.

SECTION IV - Investigation-Derived Waste Plan

If, in the best professional judgment of the DSIWM inspector, investigation-derived wastes are non-hazardous, the wastes will be double-bagged and deposited in an industrial dumpster on site or transported back to the Ohio EPA Field Landfill in Columbus, Ohio for disposal as directed in the U.S. EPA Guide to Management of Investigation-Derived Wastes, Publication: 9345.3-03FS, January 1992.

Investigation-derived wastes will generally consist of disposable vinyl and nitrile gloves, latex boot covers, and detergent water. These items are used primarily for prevention of cross-contamination and for sanitary considerations during sampling activities.

Should contact with concentrated wastes occur, disposable gear and waste water will be secured in a steel drum, on site if possible, until sample analysis results are received. If analytical data reveals significant contamination, as determined by the site coordinator, these wastes will be disposed of properly by a contracted, licensed hauling and disposal landfill.

SECTION II - Table A - Safety and Health Risk Analysis Overview

Complete the following table by highlighting or circling the appropriate answer based on site conditions. These answers will be used to complete Tables B and C.

Media of Possible Exposure:	Air	Leachate	Sediment	Soil	Surface Water
Overall Site Risk/Hazard:	High	Medium	Low	Unknown	
Waste Types:	Liquid	Gas	Solid	Sludge	Unknown
Waste Characteristics:	Corrosive	Flammable	Inert	Radioactive	Reactive
	Toxic	Volatile	Unknown	Other (specify):	
Hazards of Concern:	Asbestos	Biological	Radiological	Cold Stress	Heat Stress
	Noise	Explosive/ Flammable	Inorganic Chemicals	Organic Chemicals	Oxygen Deficient
	Unknown	Other (specify):			

SECTION II - Table B - Safety and Health Risk Analysis

List of Potential Physical and Biological Hazards

The following table must be included according to site-specific conditions. Example text below may be added to or removed as needed.

Task	Hazard	Description/Location	Procedure used to Monitor/Hazard
Driving to and from the site	**Vehicle or Traffic Accident**	Driving to and from the site.	Defensive Driving; switch drivers.
Sampling, Accessing Sampling Locations.	**Adverse Weather Conditions** (e.g., heat; cold-hyperthermia; rain; wind; lightning).	Soil, surface water, sediment, and ground water sampling locations.	Drink plenty of fluids; dress appropriate -- cold, warm; rain; stop working when lightning.
Sampling, Accessing Sampling Locations.	**Moving Objects** (i.e., vehicles; logging equipment, railroad tracks, property owner's truck; Geoprobe; getting boat to river).	Soil, surface water, sediment, and ground water sampling locations.	Be cautious and observe appropriate safety practices; notify property owner of our work areas.
Sampling, Accessing Sampling Locations.	**Tripping, Falling** (i.e., unstable ground steep bank along river; dense vegetation along floodplain; sharp objects -- puncture wounds; railroad bridge).	Soil, surface water, sediment, and ground water sampling locations.	Be cautious and observe appropriate safety practices; steel toed boots, safety glasses.
Sampling, Accessing Sampling Locations.	**Drowning** (i.e., unstable banks, boats if used; Steep river banks; sharp drop-offs from bank into deep water; dam; high water or flood waters).	Surface water and sediment sampling locations.	Life jackets will be worn when working on or around deeper areas of ponds or lakes.
Sampling, Accessing Sampling Locations.	**Objects fall from Overhead: Obscured Visibility** (i.e., dilapidated and falling roof; dark, unlit portions of buildings).	Walking through site buildings accessing sampling locations.	Be cautious and observe appropriate safety practices.

SECTION II - Table C - Characteristics of Chemicals of Concern

Chemicals Present at Site	Highest Observed Concentration (specify units and media)	Exposure Limits PEL/TLV ppm or mg/m3 (specify)	IDLH ppm or mg/m3 (specify)	Symptoms/Effects of Acute Exposure	Instruments Used to Monitor Contaminant
VOC's	TBD On-Site	See Section VII	Re Section VII	Dizziness, vomiting, fainting, possible death	Multi-RAE
SVOC's	"	"	"	"	Multi-RAE
Pesticides/PCB's	"	"	"	"	N/A
Inorganics/Metals	"	"	"	"	N/A
Radiation	"	"	"	Dizziness, vomiting, fainting, possible death, burns/discoloration to skin	Ludlum 14C Rad Meter

NA = Not available
NE = None established
CARC = Carcinogen
PEL = Permissible exposure limit
TLV = Threshold limit value
IDLH = Immediately dangerous to life or health

SECTION III - Site Control

Work Zones: N/A

This site assessment [does/does not] require the establishment of work zones. [If required] A work zone map is attached.

Communications:

Cellular phones are located in each vehicle. Two way radios will be provided for staff out of voice range.

Safe Work Practices:

- Eating, drinking, gum chewing and smoking will not be permitted on site.
- The "buddy system" will be used during all field work activities. This is defined as two trained people working as a team and maintaining contact.
- Avoid contact with contaminated, or potentially contaminated, surfaces. Walk around discolored areas, do not kneel or set equipment down on potentially contaminated ground.

Location of First Aid Kit: First Aid Kits are located in each Ohio EPA field vehicle.

SECTION IV - Employee Training

All Ohio EPA field staff working on-site have met the appropriate health and safety training requirements as stated in 29 CFR 1910.120(e). This includes initial health and safety training, annual refresher training, and three day on the job training. Included in this training is the recognition of the symptoms and signs of overexposure to chemical hazards. All Ohio EPA field staff have been trained to render first aid and CPR; and field supervisors have had the appropriate supervisory training. Health and safety training documentation is on file with the Ohio EPA Health and Safety Coordinator.

SECTION V - Medical Surveillance

All Ohio EPA field staff are enrolled in a medical monitoring program. This program includes initial and annual medical examinations, examinations upon termination of employment, and medical record keeping.

SECTION VI - Personal Protective Equipment

Ohio EPA has a comprehensive, written PPE program in place. Please refer to *Personal Protective Equipment*, OEPA-SM-06-004 for specific details.

[Work will be conducted wearing appropriate field clothing and steel-toed boots. Where needed, hard hats, safety glasses hearing protection, boot covers and safety gloves will be worn. Decisions to upgrade to a higher level (i.e., respiratory protection) or to evacuate/leave the site will be based on visual contamination and direct reading instruments as stated in Section VII, Air Monitoring.]

SECTION VII - Air Monitoring

Air monitoring will be conducted during initial site entry and sampling activities. All air monitoring equipment are on a maintenance and calibration schedule as recommended by the manufacturer. Background is to be established prior to site entry.

Instrument Name/Type	Hazard	Action Levels	Action Guidelines
Multi-RAE/combustible gas indicator (CGI)	Explosive	<10% LEL	No explosion hazard; continue monitoring
		10 -25% LEL	Potential explosion hazard; continue monitoring with caution
		>25%	Explosion hazard; evacuate
Multi-RAE/O_2 meter/Hydrogen Sulfide meter	O_2 deficient atmosphere/O_2 displaced by toxic vapors, hydrogen sulfide	>23.5% O_2	Evacuate area
		20.8% O_2	Oxygen normal
		20.8 - 19.5% O_2	Proceed with caution
		<19.5% O_2	Oxygen deficient; evacuate
Ludlum 14C/radiation survey meter	Gamma Radiation	3 - 5 times gamma background	Consult a Health Physicist
		<1 mR/hr	Continue instrument monitoring
		>1 mR/hr	Evacuate
Multi-RAE/ photoionization detector (PID)	Organic Vapors	1-10 ppm above background	Level C
Identify lamp ionization potential:	Gases	>10 ppm above background	Level B if certified; otherwise evacuate

SECTION VIII - Confined Space Entry Procedures

Areas defined as a confined space under 29 CFR 1910.120(j)(9) will not be entered. If it is deemed necessary to enter a confined space, Ohio EPA staff with the appropriate confined space training and equipment will be tasked under a separate investigation.

SECTION IX - Spill Containment Program

There is little to no potential for a spill or release of a hazardous substance on this site. However, if one should occur, the Ohio EPA spill hotline will be called to notify appropriate staff and to obtain guidance on the situation.

Ohio EPA Spill Hotline: 1-800-282-9378

SECTION X - Decontamination Program

Personnel Decontamination Procedures: All Ohio EPA field staff working on-site shall, (when needed) at a minimum, wear protective clothing (Tyvek or Saranex, boot covers and gloves). These disposable items will be used during all sampling events and disposed of at the end of the day per the investigation-derived waste plan in the work plan.

Equipment Decontamination Procedures: Disposable products are used when high levels of contamination are expected to be encountered. All sampling equipment shall be decontaminated per *OEPA-DERR Field standard Operating Procedure 10.01.*

The site health and safety officer may monitor decontamination procedures.

SECTION XI - Emergency Response Plan

In the event of an emergency, the Ohio EPA field team leader will take appropriate action. If evacuation from the site is required, three horn blasts or radio communications will signal evacuation. Ohio EPA field staff will then proceed to their vehicles.

If the landfill or site has a written emergency response plan in place, Ohio EPA field staff will follow it as appropriate.

In the event of a medical emergency, the following emergency information is provided.

SECTION XI - Emergency Response Plan (Continued)

Emergency Information		Hospital Information	
Is 911 available:		**Nearest Hospital:**	
Police/Sheriff Department:		**Hospital Address:**	
Fire Department:		**Hospital Phone:**	**Emergency:**
Poison Control Center:	1-800-682-7625		**General:**
Ohio EPA Spill Hotline:	1-800-282-9378	**Landfill Contact:**	
		Landfill Phone:	

***Map and directions to hospital are attached**

Attachment 11 – Descriptive statistics and comparisons for 119 parameters detected in Ohio C&DD Leachate

Table 20. Descriptive statistics and comparisons for all parameters detected in Ohio C&DD leachate during the 2007 leachate sampling event

60	38	18	Heavy metal, Totals	Antimony, Total	7440-36-0	mg/L	0.000574	0.0169	0.00220	0.00084	0.00106	0.00334	0.006	MCL	0.10	2.82	0.37	0.14	0.18	0.56	0.006	0.10	2.82	0.37	0.14	0.18	0.56

Note A - For the purpose of calculating descriptive statistics in this table, non-detects at the method detection limit were set equal to zero and lab estimated values were included in the calculation. Because of this, minimum and median concentrations showing zero concentration value cannot be interpreted as "not present," but should be interpreted as "concentration is less than the method detection limit."

Note B - Non-detects below the method detection limit are not included in the minimum detected columns.

Note C - Methylene chloride is a common lab contaminant. Sufficient levels were found in trip blanks for two samples to cast doubt on the validity of the methylene chloride results for those samples. As a result, the suspect sample results were removed from the data set used to produce this summary.

Note D - For pH, column 15 is calculated by dividing the minimum pH standard of 6.5 by the minimum pH measured at any one landfill. Column 16 is calculated by taking the maximum pH measured and dividing it by the maximum pH standard of 9.5 for HB standards and 9.0 for SWQ standards.

Note E - MCL = US EPA Maximum Contaminant Level or Action Level; SMCL = US EPA Secondary MCL; VAP = Ohio EPA, Voluntary Action Program Generic Unrestricted Potable Use Standard; LTHA = US EPA Lifetime Threshold Health Advisory

Note F - The MCL for xylenes is 10,000 ug/L. O-xylene was analyzed seperately from m-,p-xylene, as the MCL applies to the sum of the two results for xylenes. However, since the results were far below the standard, the application of the standard individually to o-xylene and m-,p-xylene makes no difference for the purposes of this discussion.

Note G - Multiple samples were taken from seven C&DD landfills. To prevent those seven landfills from skewing the results for mean, median, and confidence limits, the results for each parameter at each landfill that had multiple samples were averaged and used as a single data point in the calculations.

Table 20. Continued

Note A - For the purpose of calculating descriptive statistics in this table, non-detects at the method detection limit were set equal to zero and lab estimated values were included in the calculation. Because of this, minimum and median concentrations showing zero concentration value cannot be interpreted as "not present," but should be interpreted as "concentration is less than the method detection limit."

Note B - Non-detects below the method detection limit are not included in the minimum detected columns.

Note C - Methylene chloride is a common lab contaminant. Sufficient levels were found in trip blanks for two samples to cast doubt on the validity of the methylene chloride results for those samples. As a result, the suspect sample results were removed from the data set used to produce this summary.

Note D - For pH, column 15 is calculated by dividing the minimum pH standard of 6.5 by the minimum pH measured at any one landfill. Column 16 is calculated by taking the maximum pH measured and dividing it by the maximum pH standard of 8.5 for HB standards and 9.0 for SWQ standards.

Note E - MCL = US EPA Maximum Contaminant Level or Action Level; SMCL = US EPA Secondary MCL; VAP = Ohio EPA, Voluntary Action Program Generic Unrestricted Potable Use Standard; LTHA = US EPA Lifetime Threshold Health Advisory

Note F - The MCL for xylenes is 10,000 ug/L. O-xylene was analyzed seperately from m-,p-xylene, so the MCL applies to the sum of the two results for xylenes. However, since the results were far below the standard, the application of the standard individually to o-xylene and m-,p-xylene makes no difference for the purposes of this discussion.

Note G - Multiple samples were taken from seven C&DD landfills. To prevent those seven landfills from skewing the results for mean, median, and confidence limits, the results for each parameter at each landfill that had multiple samples were averaged and used as a single data point in the calculations.

Attachment 12 – Parameters Analyzed but not Detected above the Method Detection Limit

Table 21. The 180 parameters analyzed but not detected above the method detection limit during the 2007 C&DD leachate sampling event

Parameter	Parameter	Parameter	Parameter
Silver, dissolved	4-Bromophenyl phenyl ether	cis-1,3-Dichloropropene	Merphos (and Merphos oxone)
Tin, dissolved	4-Chloro-3-methylphenol	Coumaphos	Methacrylonitrile
Silver, total	4-Chloroaniline	Dalapon	Methapyrilene
Tin, total	4-Chlorophenyl phenyl ether	delta-BHC	Methyl methacrylate
0,0,0-Triethylphosphorothioate	4-Nitroaniline	Demeton-O	Methyl methanesulfonate
1,1,1,2-Tetrachloroethane	4-Nitrophenol	Demeton-S	Mevinphos
1,1,2,2-Tetrachloroethane	5-Nitro-o-toluidine	Diallate	Monocrotophos
1,1,2-Trichloroethane	7,12-Dimethylbenz(a)anthracene	Diazinon	Naled
1,1-Dichloroethene	Acenaphthylene	Dibenz(a,h)anthracene	Nitrobenzene
1,1-Dichloropropene	Acetonitrile	Dibromomethane	N-Nitrosodiethylamine
1,2,3-Trichlorobenzene	Acrolein	Dichlorvos (DDVP)	N-Nitrosodimethylamine
1,2,3-Trichloropropane	Acrylonitrile	Diethyl phthalate	N-Nitrosodi-N-Butylamine
1,2,4,5-Tetrachlorobenzene	Aldrin	Dimethoate	N-Nitrosodiphenylamine
1,2,4-Trichlorobenzene	Allyl Chloride (3-Chloro-1-Propene)	Dimethyl phthalate	N-Nitrosodipropylamine
1,2-Dibromo-3-chloropropane	alpha-BHC	Di-N-Butylphthalate	N-Nitrosomethylethylamine
1,2-Dibromoethane	Anthracene	Di-n-octyl phthalate	N-Nitrosopiperidine
1,3-Dichlorobenzene	Aroclor-1016	Dinoseb	N-Nitrosopyrrolidine
1,3-Dichloropropane	Aroclor-1221	Diphenylamine	o-Toluidine
1,3-Dinitrobenzene	Aroclor-1232	Endosulfan I	Parathion Ethyl
1,4-Naphthoquinone	Aroclor-1242	Endosulfan II	Parathion Methyl
1-Naphthylamine	Aroclor-1248	Endosulfan sulfate	Parathion, ethyl
2,2-Dichloropropane	Aroclor-1254	Endrin	Parathion, methyl
2,3,4,6-Tetrachlorophenol	Aroclor-1260	Endrin aldehyde	p-Dimethylaminoazo benzene
2,4,5-T	Azinphos-Methyl (Guthion)	Endrin ketone	Pentachlorobenzene
2,4,5-Trichlorophenol	Benzo(a)anthracene	Ethoprop	Pentachloronitrobenzene
2,4,6-Trichlorophenol	Benzo(a)pyrene	Ethyl Methacrylate	Phenacetin
2,4-Dichlorophenol	Benzo(b)fluoranthene	Ethyl methanesulfonate	Phenanthrene
2,4-Dinitrophenol	Benzo(g,h,i)Perylene	Famphur	Phorate
2,4-Dinitrotoluene	Benzo(k)fluoranthene	Fensulfothion	p-Phenylenediamine
2,6-Dichlorophenol	beta-BHC	Fenthion	Pronamide
2,6-Dinitrotoluene	Bis(2-Chloroethyl)ether	Fluoranthene	Propionitrile
2-Acetylaminofluorene	bis(2-Chloroisopropyl)ether	Fluorene	Pyrene
2-Chloronaphthalene	Bolstar (Sulprofos)	gamma-BHC (Lindane)	Ronnel
2-Chlorophenol	Bromochloromethane	Hexachlorobenzene	Safrole
2-Methylnaphthalene	Bromodichloromethane	Hexachlorobutadiene	Stirofos (Tetrachlorovinphos)
2-Naphthylamine	Bromoform	Hexachlorocyclopentadiene	Sulfotepp
2-Nitroaniline	Bromomethane	Hexachloroethane	sym-Trinitrobenzene
2-Nitrophenol	Butyl benzyl phthalate	Hexachloropropene	TEPP
3,3'-Dichlorobenzidine	Carbon tetrachloride	Indeno(1,2,3-cd)pyrene	Thionazin
3,3'-Dimethylbenzidine	Chlorobenzilate	Iodomethane	Tokuthion (Prothiofos)
3-Methylcholanthrene	Chlorodibromomethane	Isodrin	Toxaphene
3-Nitroaniline	Chloromethane	Isophorone	trans-1,3-Dichloropropene
4,4'-DDD	Chloroprene	Isosafrole	trans-1,4-Dichloro-2-Butene
4,6-Dinitro-2-methylphenol	Chlorpyrifos (Dursban)	Kepone	Trichloronate
4-Aminobiphenyl	Chrysene	Malathion	Vinyl acetate

Attachment 13 – Analysis of the effect of adjusting the analytical results of seven landfills that had multiple samples

The adjustment that was made was to average the concentration values for each parameter for each of the seven landfills that had more than one sample analyzed. This resulted in each of the seven landfills having only one concentration value for each parameter instead of two or three values. Some objections to this adjustment may be raised. These include, possibly having the effect of diluting the representation of the concentrations of those parameters for those landfills in the calculation of the overall mean across all landfills, lowering the upper confidence limit since the standard error of the mean could possibly be reduced because the influence of the higher maximum values is muted for those landfills, and increasing the lower confidence limit because the standard error of the mean might be reduced because the muted influence of the lowest values for those landfills.

However, for this analysis, the minimum and maximum concentrations as measured for each parameter across all of the landfills are also compared against the health based standards and the surface water quality standards. Doing this provides the appropriate information for this report and mitigates the possibly muted results that may have occurred for a few parameters, while at the same time providing the assurance that the seven landfills that had multiple samples analyzed did not skew the results.

To verify this, comparisons against the health based standards and the surface water quality standards were conducted using two data sets. One data set included the adjusted concentrations for the seven landfills that had multiple sample analysis results along with all of the data for the remaining 23 landfills. The other data set was not adjusted.

For the health based standards comparison, three parameters (iron, methylene chloride, and sulfate) had one of the comparisons with one descriptive statistic that changed status due to the adjustment.

However, in all three cases, the parameters were already included in the list of parameters that exceeded the health based standards because one or more of the other descriptive statistics exceeded the health based standards (see Table 22).

For the surface water quality standards comparisons, 10 parameters (copper, iron, methylene chloride, phosphorus, selenium, sulfate, thallium, vanadium, vinyl chloride, zinc) had one of the comparisons with one of the descriptive statistics that changed status due to the adjustment.

However, in all 10 cases, the parameters were already included in the list of parameters that exceeded the surface water quality standards because one or more of the other descriptive statistics exceeded the surface water quality standards (see Table 23).

This demonstrates that the adjustment did not change the outcome of the determinations for which parameters exceeded health based standards or surface water quality standards, while at the same time providing assurance that the analytical results from the seven landfills that had multiple samples did not skew the determinations.

Subject: Monofill

The site for the proposed monofill on the Glenn is clearly wrong for the purpose.

The water table has been punctured by quarry operations, so any decision based on a barrier under a mixed waste dump is invalid. Rain will come, floods will occur, and the containment waste will mix with the water table.

Further, no reasonable solution for waste containment during sustained 70 mph winds exists, rendering the proposal invalid. Low fences will not work.

Finally, self-policing of the materials coming in to the site will be ineffective. The company has a record of malfeasance and disregard for the law.

Please don't allow this dump to be part if the valley's heritage, nor yours.

Respectfully,

Michael Franznick

I have worked for crs for 5 years now and been with CEI since 2005. I know that there is no hazardous material and no household trash gets sent out. I'm in support of the Monofill in Palmer. I am a valley resident and my livelihood is supported by CRS. They are a good company and will bring new jobs to the valley.

Subject: Central Monofill permit application

Hello again,

I am a long time valley resident(55 years) and I very much support Central Monofill Services in their quest to bring a Construction and Demolition Monofill to the Mat Su Valley. I very much believe in recycling when possible and I am sickened to see what get crushed and covered at our local landfill. Please approve this permit. I see this Monofill along with Central Recyclings sorting facility as another way to divert and recover materials that would otherwise be lost into our Central Landfill. Thanks, Tracy Moffitt 355-3384

I am adamantly against Central Monofill Services application to operate a dump of any type at the purposed site in Matsu. There is too much at risk for our rivers and wells to gamble that nothing would affect either.

Subject: Monofill permit: Palmer

To Whom It May Concern,

This is to address the monofill permit application in South Palmer. While it might be in the interest of the Valley to allow such types of land use, this location is far from ideal. My first concern is the strong winds experienced in Palmer. Even with a wind catchment fence, some plastics and small particulates will not be caught. This could be especially damaging if something like asbestos or other material that is harmful to human health is dumped and picked up by the wind. My second comment addresses the water quality issues. Considering the problems the gravel pit had with locating the depth of the groundwater and that the soils in that area are highly permeable, it seems irresponsible to allow an un-lined landfill of any sort in such close proximity to drinking wells.

It seems like this type of landfill would be best located in an area with less wind and without the groundwater concerns.

Sincerely,
Lorene Lynn

Subject: Please support the Central Monofill Services Conditional Use Permit

To whom it may concern:
I am writing in support of Central Recycling Services' proposed monofill near Palmer.

I have seen various news stories about the project in local newspapers and on the local television news. I have friends who live near the proposed monofill site, and I was concerned about what I was seeing in the articles. I contacted Shane Durand directly, and he agreed to give my family a tour of the monofill site. He showed us where the dump site would be and how the demolition debris would be buried.

He also explained that that Central Recycling Services is locally owned by long time Alaskans, and he was born and raised in Southcentral Alaska. His company employs many folks that call the Mat-Su Borough home.

This a good project that supports Alaskan business and local Alaskan workers. Central Recycling Services should be allowed to develop this monofill.

Sincerely,
Cynthia Juettner

Hi Susan

Please find Mt. View Estates HOA comments concerning the Conditional use permit for the operation of a monofill for CMS attached to this email.
Thank you for considering our comments

On a side note I have never understood how the initial conditional use permitting for this property with the previous owner was not binding by law regardless of transfer of deed.

Thank you
Emmett Leffel

Memorandum

Date: October 2, 2014
From: Susan Lee, Planner 11
Subject: REQUEST FOR REVIEW AND COMMENTS
Project: Application for a conditional use permit for the operation of a monofil
Parcel ID: Township 17 North, Range 2 East, Sections 18 & 19, Seward Meridian
Applicant: Central Monofill Services

Thank you for receiving and considering our comments concerning these important issues. It is with great concern that we as a Home Owners Association respond to this memorandum. Our earlier testimony on these issues pertaining to this applicant and conditional use permit has been recorded and heard by the Borough concerning this Applicant's failure to meet reasonable expectations of the Borough and its residence. This applicant has proven from day one that they are not concerned with protecting our water quality, land, air or even following basic permit guidelines and requirements. The gross violations of their previous conditional use permit and blatant degradation to surrounding environments and water quality has proven their complete disregard for community and our environment. Mt. View Estates HOA's primary concern is protecting our quality of life, property value and our water supply. With a community well serving our entire subdivision connected to the same aquifer that has been punctured on this property, we strongly urge the Planning Division, the Borough Manager and Assembly to reject this permit application for the operation of a monofil.

Respectfully

10-30-14

Subject: Proposed Monofill in Palmer

To whom it may concern,

My name is Matthew Moffitt and I support the Monofill being opened up in Palmer. I am an employee of Central Recycling Services (CRS) but more importantly I am a Palmer resident. I was born and raised in Palmer. In fact my family on both sides (Moffitt's and Kincaid's) goes back several generations; Moffitt's having a farm from the 1930's to today. I guess what I am trying to say is I am passionate about Palmer. I love my city and I would never be okay with any company bringing toxic materials in. That is not what CRS does; it never has and never will.

Truthfully these negative assumptions about CRS could not be further from the truth. CRS is all about going green, that is its entire identity, to put it plainly; without recycling the company would not even exist, all revenue is based on it. The company is known in the state as a forerunner in recycling and continues to find new ways to use materials that used to just fill up landfills. Case and point would be glass; CRS is the only major recycler of glass in Alaska. Not to mention they have the only C&D shredder in the state, which means thousands of tons of debris that would be sent to a landfill yearly are instead recycled and sold both domestically and internationally. This helps the economy of Alaska and helps keep our state beautiful. I guess all that being said, what bothers me most is the assumption that this is some big Anchorage corporation that doesn't give a care about small little Palmer.

The manager of CRS is a lifetime Palmer resident. The company employs a large number of valley residents. Off the top of my head I can count at least nine employees who work at CRS who also live in the Palmer/Wasilla area. This isn't some evil corporation from Anchorage that has no valley interests at heart. This company has more than half of its employees from the valley. I happen to be one of those employees and I can honestly say that I am proud to work for a recycling company that is making a difference.

I guess in the end, all I am trying to say is if we as a society deny the necessary operations to increase recycling then we should stop complaining when people don't recycle. CRS is a company attempting to make a difference, be it glass, C&D, concrete, asphalt, or metal; it is all recycling and all making a positive impact on the economy and environment. CRS is not a huge corporation that doesn't care, they will help recycling in the valley, they employee valley residents, and they will help the overall economy of the valley. I believe in recycling, I believe in going green, and I believe in CRS and their mission to help the environment.

-Matthew Moffitt

Subject: Proposed Palmer Monofill

To whom it may concern,

My name is Matthew Moffitt and I support the Monofill being opened up in Palmer. I am an employee of Central Recycling Services (CRS) but more importantly I am a Palmer resident. I was born and raised in Palmer. In fact my family on both sides (Moffitt's and Kincaid's) goes back several generations; Moffitt's having a farm from the 1930's to today. I guess what I am trying to say is I am passionate about Palmer. I love my city and I would never be okay with any company bringing toxic materials in. That is not what CRS does; it never has and never will.

Truthfully these negative assumptions about CRS could not be further from the truth. CRS is all about going green, that is its entire identity, to put it plainly; without recycling the company would not even exist, all revenue is based on it. The company is known in the state as a forerunner in recycling and continues to find new ways to use materials that used to just fill up landfills. Case and point would be glass; CRS is the only major recycler of glass in Alaska. Not to mention they have the only C&D shredder in the state, which means thousands of tons of debris that would be sent to a landfill yearly are instead recycled and sold both domestically and internationally. This helps the economy of Alaska and helps keep our state beautiful. I guess all that being said, what bothers me most is the assumption that this is some big Anchorage corporation that doesn't give a care about small little Palmer.

The manager of CRS is a lifetime Palmer resident. The company employs a large number of valley residents. Off the top of my head I can count at least nine employees who work at CRS who also live in the Palmer/Wasilla area. This isn't some evil corporation from Anchorage that has no valley interests at heart. This company has more than half of its employees from the valley. I happen to be one of those employees and I can honestly say that I am proud to work for a recycling company that is making a difference.

I guess in the end, all I am trying to say is if we as a society deny the necessary operations to increase recycling then we should stop complaining when people don't recycle. CRS is a company attempting to make a difference, be it glass, C&D, concrete, asphalt, or metal; it is all recycling and all making a positive impact on the economy and environment. CRS is not a huge corporation that doesn't care, they will help recycling in the valley, they employee valley residents, and they will help the overall economy of the valley. I believe in recycling, I believe in going green, and I believe in CRS and their mission to help the environment.

Subject: Fwd: Proposed Monofill

To the Mat-Su borough planning commission and Mat-Su Borough Staff:

I am a proud supporter of the CMS Proposed Monofill on the Glenn Highway. I was born and raised in the Matanuska Valley and am a lifelong Valley resident, my family has been in the Matanuska Valley since the late 1930's. I work for Central Recycling Services and I support the proposed monofill because of facts not feelings. It makes me sick to see the lies that have been said about CMS and Shane Durand. The main people in opposition of the proposed monofill have spread propaganda, mislead, and blatantly lied to the general public regarding this proposed monofill. The very premise of their opposition is a lie, "Palmer Toxic Dumping". If I was a member of the general public with no knowledge of the proposed monofill and I read this, I would be in immediate opposition. They use powerful words to incite an emotional response in people who would otherwise take no interest in the proposed monofill, which would be fine if it wasn't based on a lie. However, the truth is, this material comes from buildings and homes that are occupied by humans. The material that would be placed in the proposed monofill has undergone more screening, testing, and sorting than the material that goes into any other monofill in the State of Alaska. Any hazardous materials, including asbestos, have been removed from the waste stream and dealt with properly (this is not speculation but a fact because I have personally seen it done). This is not to say that any other monofill is doing anything wrong but to say that we are a recycling company first and foremost, we process all of the material that comes through our facility. CMS is not inventing new materials to put into a monofill, these are the same materials that go into the Mat-Su Borough's monofill and Alaska Demolition's monofill, with one differentiating fact, the material that would go into the proposed CMS monofill has been processed and sorted to ensure that all hazardous materials are properly dealt with!!!!!

Every load of material that is delivered to our recycling facility is delivered under the knowledge that we do not accept hazardous materials, this is clearly outlined in our credit application and on our website. When the load is dumped at our facility, it undergoes visual inspection by trained personnel with the following tier of importance: 1.) Does the load contain anything hazardous? 2.) What is recyclable? If the answer to the first question is not a definitive no, we put the load aside for further testing to ensure that it does not contain hazardous materials. If the load does contain hazardous material, it is cleaned up in accordance with all applicable rules and regulations. If we are sure the load contains nothing hazardous, then and only then will we pull the recyclable materials from the load. By the time any material leaves our facility it has been processed and sorted by multiple people and machines.

If you were to ask everyone in opposition to this proposed monofill the following question: Do you support recycling? I would be shocked if you were to hear a single "No" answer. Recycling and Reuse of materials is becoming more popular and necessary every day. The proposed monofill would allow for recycling in the Mat-Su valley on a level that is currently not attainable. We don't recycle materials by the pound, we recycle them by the ton and we do so without being subsidized by the government. It would allow for reusable materials to be sold in the valley at a competitive rate and it would also open the valley up for the recycling of Construction and Demolition debris at competitive prices. In my experience if it costs someone more to recycle than it does to dispose of a material, generally they are not going to recycle it. It is irresponsible not to support a company that is willing to recycle materials that are not currently being recycled, especially when it doesn't cost an extra cent in taxes!!!!

The truth is, we are a good company that is run by good men, one of those being Shane Durand. We do a job that most are unwilling to do and we do it extremely well. I have heard some people say that the employees working for this company are untrained, that is completely false and unverified, the employees here are highly trained and knowledgeable regarding recycling and identifying hazardous materials. The opposition to this proposed monofill is based entirely on fear, not facts. The facts clearly show that we are capable of running a recycling facility and a monofill.

One of the largest gatherings in the state of Alaska is located across the street from an active monofill. Alaska Demolition's monofill is right next to the Alaska State Fair. How many Alaska State Fairs have been ruined by the monofill next to it?

This is a case of a few neighbors, who can't even see the proposed monofill from their homes, doing and saying whatever it takes to garner an emotional response from people who would otherwise take no interest in the proposed monofill. The majority are misinformed, some of my friends and family have been placed on a list of people who opposed the proposed monofill, without their consent or knowledge. "Where emotions run high, logic runs low" (Unknown). Please look past the emotions and the lies, and do the logical thing, support this proposed monofill based on the facts. Thank you for your time.

Subject: Construction landfill

Dear Planning Commission members,
Please don't allow the gravel pit off of Glenn Highway to become a construction dump site. I have a daughter, son-in-law, and three grandsons who live in a subdivision very near the gravel pit site. The new pit owners have been dumping materials at night and covering it up already without a permit. My daughters water has increased in sediment and poor quality. I fear for the health of many people in the area. If the owners of the pit are dumping illegally already, what makes us think that they would do it with safety for the area as their concern.

Thank you for your time.

To Whom It May Concern,

I am writing to express my opposition to the proposed monofill site just across the Glenn Highway from my home. We have lived in the area for over 10 years and I am concerned about the potential environmental affects having such a site near my home could cause. I have 4 children and I feel having the monofill site nearby could also adversely affect their health should any unforeseen pollution occur. Needless to say our property values could also be negatively affected. I appreciate that we can comment on this proposal and hope that our concerns are heard.

Sincerely,

Jesse and Carrie Hronkin

Subject: Regarding Central Monofill's conditional use permit application

Dear Susan Lee and Planning Commission Members,

As a homeowner and property owner located within 1 mile of the proposed monofill site I am strongly opposed to the approval of Central Monofill Service's application.

I strenuously urge you to reject Central Monofill's application for the following reasons:

For the well-being of the residents in close proximity to 2840 and 2560 S. Glenn Hwy. who may develop mesothelioma or other asbestos related diseases. Also, the well water consumed by the residents of this area may be polluted by contaminants originating from the monofill. Even the disposal companies with excellent integrity make errors in judgement that cause harm to their surrounding residential and other neighbors. The Central Monofill Services company has already been cited and fined. This demonstrates that the residents in close proximity to the monofill site cannot rely on Central Monofill Services to put their health and well-being needs first.

Adverse effects to one of the finest and most popular natural recreation areas in the valley, the Matanuska Greenbelt trail system with its multitude of lakes, makes the potential losses to Palmer too high of a risk to take.

The monofill site is a poor introduction to Palmer's scenic beauty. It will detract from residents' and visitors' enjoyment of Palmer-the historical landmarks, the Alaska State Fair, the numerous open air events held at the fairgrounds, etc.

The value of properties in close proximity will decline, with properties falling into decay and creating a location known for its depressed economic status that families reject, attracting property abandonment and irresponsible property ownership. Most responsible property owners will not choose to live next to a dump. This will exponentially grow the eyesore of the dump and the view that first confronts each traveler to Palmer. What might people of the future see as they enter the valley, stop at the new Visitors' Center and proceed to Palmer if you approve this conditional use application? Might the approval of this application lead to weightier issues and problems to be solved by the Matanuska Borough at some point in the future?

Thank You for Your Consideration!

Respectfully Submitted by a citizen who believes Palmer is a stunning and very special place live!

Subject: Public Comment: Central Monofill Services Conditional Use Permit Application

Diane Warta
1021 S Rebecca Drive, Palmer
Lot 1, Block 7, Pioneer Meadows Phase 3

My family and I live in an area surrounded by majestic mountains, well-maintained neighborhoods, and pits left by years of gravel mining. It is our desire that the land which was stripped with the gravel mining be restored. This restoration must be done safely and responsibly. It is not clear that the proposed monofill dump site will fulfill these requirements..

Of utmost importance is the protection of our water supply and aquifer. The gravel pit has open ground water, a punctured aquifer, and by the nature of a gravel pit is porous ground. In addition, it is surrounded by neighborhoods which obtain their drinking water from wells and recreational lakes. Only a few miles south of the proposed dump are wetlands which are a critical component of salmon habitat. The Flint Hill Refinery contaminated well water for miles surrounding it and we must insure this does not happen here.

In the Lower 48, monofills have been established in open mine pits. Safety precautions for these monofills include installation of a bottom liner systems, maintaining individual cells, a storm water drainage systems, and leachate collection systems used to treat ground water that comes in contact with waste material. Are these safety precautions included in the permit application? If these safety precautions fail, groundwater pollution is much more expensive to clean up than surface water pollution. Therefore, catastrophic insurance should be required. In addition, an independent monitoring system should be in place.

Strong winds prevail in our glacial valley. Any light weight material which is not secured will be blown downwind, littering our shrubs, trees, and wetlands. This effect is increased in the winter months when the winds are stronger and the cover material is frozen down. We don't want our neighborhoods to be an unsightly mess.

Additional concerns include increased truck traffic on a dangerous corridor entering our town, an ugly dumping ground visible from this same road, potentially dangerous fumes from the breakdown of gypsum in the drywall, and unpleasant smells pervading our neighborhoods.

In light of these concerns, the conditional use permit for Central Monofill services should be denied.

Subject: Support of the Palmer Monofill

To whom it may concern,

My name is Nathan Kruk and I fully support the Palmer Monofill. I am originally from Maryland, a state at the forefront of recycling, I grew up in the waste and recycling industry. I've dealt with most commodities of recycling from electronic, metal, plastic, cardboard, paper, x-ray, wood, sheet rock, medical the list goes on. As much as we wish to recycle 100% of everything. We have to face reality and the facts of life. We as humans will always generate waste. However it is our responsibility to reduce, reuse, recycle and dispose of our waste in a responsible manner. Monofills have been proven time and time again that they are a better source for inert debris than a landfill. It's a shame a local Alaskan company trying to do good and give back to the community is instead being relentlessly attacked and bullied. I am PROUD to say I work for Central Recycling Services, a company that gives back to their employees, gives back to their community and truly cares about the environment. Show the world that Alaska cares about the environment & Mother Nature. Please pass the Monofill.

With much hope,

Nathan Kruk

Response for Comments

Project: Application for a conditional use permit for the operation of a monofil

Parcel ID: Township 17 North, Range 2 East, Sections 18 & 19, Seward Meridian

Applicant: Central Monofill Services

As a resident of Palmer, a lifelong Alaskan, a homeowner, and a mother I wish to voice my concern and oppose the permit of a monofill at location: Township 17 North, Range 2 East, Sections 18 & 19, Seward Meridian. My water source is fed by the aquifer under this proposed site, which has already been documented to have been punctured by the previous owners. In NO way is this a justified or acceptable calculated risk of potential contamination of the water that my family drinks everyday and feeds my gardens in the summer to only then be consumed by us. We must protect our water source today and for the future of our children. I believe that there is no need to have a monofill dump anywhere within a residential location. There is beautiful water recreation area that sits right next door that must be protected also for future generations. Once the damage is done it is nearly impossible to correct so the only thing we can do is not allow the potential contamination to occur to begin with. Please consider a denial in this permit process and demand that Central Monofill Services finds an acceptable location to conduct this monofill elsewhere.

Subject: Central Monofill Services Conditional Use Permit Application

Dear Ms. Lee:

My husband and I live at 2135 S. Killarney Drive (Lot 3, Block 2, Canoe Lake) in Palmer. I have briefly reviewed the report regarding the potential impact on groundwater by the proposed monofill presented by Maddox & Associates of California in support of the application and those prepared by J. A. Munter Consulting of Alaska in review of the Maddox report. The reports are very disturbing. Maddox's report seems to have been prepared with inaccurate information reaching misleading conclusions. The possibility of contamination of our water is of utmost importance to us and I feel that if the applicant wishes the Borough to give consideration to its application, it should prepare its report with factual information. CMS, in submitting this misleading report, and in its prior action of beginning its dumping operation without a permit, is not presenting itself as a company that can be trusted. I would encourage the Borough to deny CMS's permit application.

Thank you.

Subject: opposed to issuing Central Monofill Services Conditional Use Permit

Susan Lee,

I'm writing to express my opposition to the Matsu Borough issuing a conditional use permit to Central Monofill Services (CMS).

Residents in the area depend on private water wells, and there is too much risk of the Central Monofill Services operations at the site leading to ground water contamination. Storing primarily non-hazardous shredded residual nonrecyclable waste material from construction and demolition waste and regulated Asbestos Containing Material (RACM) and Non-RACM at a site so close to an aquifer that so many people depend on is irresponsible and unacceptable. The risk of water contamination is just too high and cannot be corrected if it occurs. The Matsu Borough would be taking on a huge liability by issuing the permit. If water contamination occurs the Borough will be found negligent.

As you may be aware, Federal studies in the lower 48 have linked monofills to suspected carcinogens and release of hydrogen sulfide gases.

Also, Given Central Monofill Services poor history of compliance with regulations and permitting requirements, the permit should be denied.

I am also concerned with blowing debris from the site as well as traffic disruptions on the Glenn Highway related to the CMS operations.

The residents of the Matsu Borough in the are sent a strong message to the Borough assembly once and have sent the same message again; please deny the permit for Central Monofill Services or any other company to use this site for operating a monofill!

Regards,

Scott Kolstad

Subject: CMS permit

We oppose the CMS corporation re-application for operating a monofill/recycling facility at @~mi.38.5 of the Glen Hwy. One look at an aerial photograph of the area will say it all. The company wants to operate a C&D (construction and debris) pit right next to two open fresh water ponds (NOT industrial ponds). The water table in this area is fragile at best. All neighboring lakes will experience adverse effects from percolation and runoff from the 'dump' site. The lakes have already experienced major rising of waters and property loss due to activities directly associated with these ponds. Kepler Bradley, Canoe, Irene and Long Lake amongst others are at an all time high.

This area has a frequented State Park Recreational area that offers miles of lakes and trails that we desperately need to foster...a greenbelt in our ever growing Valley.

Please do not let this be ruined by allowing this facility free rein.

Mat Su Borough...the Heartland of Alaska. Let's keep it that way!

Subject: Please Support the Central Monofil Services Conditional Permit

To Whom it may Concern:
I am familiar with the proposal from Central Monofill Services for a conditional permit to open a facility off the Glenn Highway. I believe in responsible disposal of waste products. Central Recycling Services (CRS) has an operational facility in Anchorage. Their proposal would monofill residual material from that facility and backhaul recyclable waste from the valley. I support this plan.

A conditional permit should be granted based on facts coupled with the required conditions to support responsible disposal. We currently have a company operating a monofill in the Valley and I believe an established business establishing a means to add additional opportunities to recycle would be Valley asset. I recognize that as long as humans generate waste responsible disposal is a necessary part of living in a community. Thank you for your time.

Subject: Palmer Dump
Date: October 31, 2014 5:23:02 PM AKDT
To: slee@matsu.gov.us

To Whom It May Concern:

I am writing in the hopes that my voice will be heard on a issue of tremendous importance to me, my family, my neighbors and my community. The proposed dump site for Central Monofill Services is unacceptable on many levels.

1) The Proximity of potentially hazardous waste to an already exposed aquifer is a major health and safety concern for every household whose wells are fed by said aquifer. No one can argue that clean water is a basic human necessity and CMS has not, and I believe cannot, adequately address this very real threat.

2) This dump is likely to have a negative impact on the environment as it gradually pollutes the habitat of migrating birds and other animals.

3) Property values will decrease. Let's be honest. No one likes trash.

It is our privilege to live in such a pristine and breathtaking place, and we can decide to keep it that way. Palmer needs to lead the way in the Valley through proactive planning. The location of this dump will destroy the beauty and appeal of our lovely town. I urge all involved to consider a more appropriate location for CMS operations.

Sincerely,

Natalia Sahlstrom

To: Susan Lee
Subject: FW: Comments on Conditional Use Permit application by Central Monofill Services Inc.

Dear Susan Lee and Mat-Su Planning Commission,

Our home is located at Canoe Lake Subdivision #2, Lot 9, on the border of the proposed landfill. We have lived in our home since 1979.

For several reasons, we strongly protest the granting of a Conditional Use Permit for Central Monofill Services, Inc. (CMS). The proposed site is located on MSB Tax Parcels: 17N02E18C010 (2840 S. Glenn Highway) and 17N02E19B006 (2560 S. Glenn Highway; within Township 17 North, Range 2 East, Sections 18 and 19, Seward Meridian.

First of all, this landfill poses a nuisance to our neighborhood. Already, wind has distributed materials from the landfill site to our neighbors' property. CMS did send workers to clean up the debris, but a walkthrough of the property by another neighbor and myself revealed that there was still a log of smaller debris that was missed. And this was before they have the operation up and running. I believe their promises to prevent future catastrophic distribution of their fill materials to neighboring properties greatly underestimates the potential for extreme high winds to pick up and spread uncovered materials for miles around during a heavy, unpredictable, wind storm. The cost and of such a cleanup would be very high, and the complete success of such an effort questionable.

Not only could such a windstorm greatly soil neighboring properties, I find it hard to believe that there would be no concern for health issues related to breathing the fine materials in the air itself.

Second, the loud "beep" "beep" of heavy equipment at all hours during the day can be quite disturbing. And it appears that this could go on for six days out of the week from early morning to late in the evening, right behind our home.

Third, based on the facts that the owners originally starting working the landfill (testing?) before receipt of a permit, denied the trash was theirs, pumped soiled water (indirectly) into the ponds that feed our water table, buried instead of removing as directed some of the material they had placed in the landfill, resulting in a stop order from your code compliance division, received several citations – I cannot imagine trusting their word on anything, however well-intentioned they may be; they are out to make money.

Fourth, how can we trust that the operation will not have a negative impact on our drinking water? Much of the runoff from the dumpsite could potentially find its way into the aquifer that supplies drinking water for hundreds if not thousands (all the way to Anchorage) of private wells. We are looking to the Borough to look out for its citizens health and welfare. Is the Borough prepared to respond to a class action lawsuit of a sizeable magnitude should such an event occur? This could be a financial disaster for the borough.

We are trusting in our Borough leadership to recognize the unsuitability of the property in question to be used for CMS's intended purpose.

Please do not let us down.

Sincerely,

Johnnie and Donna Davis

Subject: Please Support the Central Monofill Services Conditional Use Permit

As a recreational family property owner in the Mat-Su Valley, I would like to express my support for the Central Monofill Services monofilll project adjacent to the Glenn Highway in the Palmer gravel pit complex.

As a contract manager, laborer and safety specialist for the construction and oil and gas extraction industry I have dealt with Central Recycling Services and related companies for several years. Their service has been excellent and the concern for the local conditions and environment can not be paralleled. Their concern for Alaska is brought up from the ownership & management team, Alaskans taking care of Alaska.

The emotional hyperbole being thrown about by the detractors of the project has been unscientific at best, and blatant mis-information in many cases. If the group was so concerned about the Mat-Su Valley, perhaps they would have participated in the Spring Property Clean-up, dispose of the yard cars, maybe even register their cars in Alaska. Instead we have "transplants" from California and Portland, Oregon adding cars to the parking lots of public meetings with expired out of state plates attempting to "Portlandify" Anchorage and the Mat-Su Valley. Why are they making decisions for Alaskans when they can barely claim residency?

The science behind construction and demolition waste management has proven screened inert waste does not create health hazards. Even an Asbestos Cell in a monofill has no waste migration hazard in 40,000 years (my loose recollection of the State of California and Demolition Industry Statistics).

Worker protection for a company the size of CRS is a huge concern, and has been addressed through engineering controls to protect employees from dust, heavy materials and mobile equipmen, administrative controls through handling proceedures governed by the EPA, OSHA, ADEC, AKOSH and industry best practice that is supported by the courts. I have witnessed the systems in place at CRS touring the Anchorage facility and frequently find them to be on a par with the controls in the oil and gas industry as well.

I can not even begin to cover the arguements for the monofill on a point for point basis compared to the detractors. There is no real argument against the landfill outside of the "Not in My Back Yard" scenario.

Relative to the recycling options and pro-active waste reduction management CRS provides to all of south central Alaska the monofill is the only option if the Mat-Su Borough wants to reduce the burden on the tax payer by prolonging the life of the existing landfill.

Thank you,
Erik Christenson
Eagle River, Alaska

Martin L. Meigs

ALASKA SPORT FISHING ASSOCIATION

31 October, 2014

Greetings!

As a representative of the Alaska Sport Fishing Association, I would like to make a few comment regarding the landfill being proposed by CEI

1. This Association has finds no reason to oppose the proposed CEI landfill as it will not affect our fishing resource in any way. Quite the contrary. Having a place to dispose of the construction waste generated in the Mat-Su Borough is essential to prevent the random, unsupervised dumping of such material in areas where there might be an impact on the general environment and/or fishing quality in the area.
2. CEI is operated by local Alaskans who do have a stake in the State whereas an out of state run company might be a lot less inclined to be as responsible (and accessible).
3. The need for such a landfill is obvious and it might well fall on the backs of the Borough taxpayers if this private, local-job-providing company is prevented from moving forward with their plan.
4. The objections from the nearby residents (NIMBYs) are not valid, legitimate or relevant. Any dust generated by the landfill would pale by comparison to the dust generate by the winds blowing over the glacial till in the area.
5. The proposed project will lower disposal and recycling costs and thereby reduce new construction costs, extend the life of the other landfills in the area that can and do handle hazardous materials.
6. Central Recycling Services has helped several nonprofits in the Matanuska Valley and employees many valley residents. Our organization is just one of many that has benefitted from the Companies' generosity and sense of civic responsibility.

Denying the permit will have far greater consequences than those feared by the local homeowners. Indeed, some of those residents may well benefit from employment opportunities resulting from the project!

I would urge you to not delay or deny the permit.

Subject: CMS private dumping

To whom it may concern,
My husband & I live in the area being considered for a private dump, located on the Glenn highway in Palmer.
We are opposed to this business for the following reasons:
a) groundwater (drinking water) & surface (recreational) water pollution since the pit will be unlined and monitored for toxics substances
b) decrease in property values
c) windblown debris
d) hazards to local wildlife
e) air pollution due to illegal burning of trash
f) non-approved substances being dumped into site due to non-monitoring of site contents
g) lack of bonding
h) history of non-compliance
i) undue burden (medically & financially) on adjacent property owner's when groundwater is contaminated
j) agricultural water contamination of adjacent farms

In closing, established landfill practices, should be followed to prevent unnecessary contamination of local water and air.
Without 3rd party monitoring, the risks to the public will violate the conditions of the permit.
There is another waste dump site immediately east and within a 2 mile distance from our home already. Is this site being monitored?

Thank you for your consideration,
Sincerely,
Melanie & Mark Glatt

Subject: Re: Comment Re: CMS Dump

I was on the Port commission for 10 years and was one of those dedicated to see some economic development here in the Valley. There are thousands of acres surrounding the Port development and I'm sure a site could be found acceptable to all the parties concerned. Placing a "TOXIC" dump between two housing developments makes no sense at all. A dump site at Port Makensie could be one more reason to construct the Knick Arm Crossing and further the boroughs development plans enhancing economic development. Future generations of the Valley should not be left to deal with this problem. Lets all do some sound planning and blueprint all future projects that have vital importance to our beautiful "VALLEY"and it's citizens.

Message:	Our family built our home at 2115 Killarney in the early 70s. we moved from Anchorage to escape the big city life. Our son attended Palmer schools. Forty years of our lives have been spent at this location. In my working years, paying taxes I never imagines a toxic waste dump being built within 1000 yards of my property. This is what CMS wants us to do. We have enjoyed the finest water from our wells all these years and now a proposal to contaminate our water supply with as the present application reads, primarily non toxic waste material. I don't think so and I am sure our neighbors feel the same way. We let the gravel pits in and find out it was a big mistake Lets not let this happen for Gods sake. Lake Wilder should be stocked with fish and set aside as a pristine park further enhancing the beauty of the valley. any questions please contact me.

Subject: Palmer Toxic Dumping

To Whom it may concern,

My name is Teresa Beck and I live in Palmer a quarter mile from the Alaska Demolition landfill for inert waste. I just forwarded you the letter I wrote to Frontiersman this past February. Palmer does not need another landfill of inert or recycled waste. In winter months, there is a distinct smell emanating from the Alaska Demolition site off Rebarchek Road. I recorded 8 days in March 2013 in which I could detect the hydrogen sulfide smell. In December 2012, there was distinct smoke coming from the landfill site. Palmer Police dispatch told me it was an underground fire in the landfill in the morning as they had just confirmed it with an officer going to the scene. By the afternoon, the story had changed and even though I saw huge clouds of smoke in that area, I was told it was from another location.

The fact is that we don't need another mess that is uncontrolled. CMS has misbehaved already by dumping prior to their permit. The public cannot monitor these sites enough to make sure the right things are put there. No one can prevent decomposition that will eventually smell or spontaneously decombust. No one can predict the future impact on our water table and wells. This new south Palmer location is not the right place for this the water table is too sensitive. Do we want to smell hydrogen sulfide every time we drive into Palmer? CMS is doing this for their profit. They can find another location or pay to dispose of their waste in public landfills.

Sincerely,

Teresa Beck

Subject: No to CMS dump on Glenn

I am expressing my opposition to CMS's permit application to operate a dump off the Glenn Highway in Palmer. As a Palmer resident (even if I weren't), I oppose approval based on the risk for safety of the water supply, aesthetics of the surrounding area and disregard of corporate social responsibility (no apparent contingencies for potential damages).

Thank you for your consideration.

I live at 1294 South Thalo Drive near the proposed waste disposal location. I strongly oppose the current proposed location and have the same concerns as the Palmer Toxic Dumping Community Group (potential introduction of asbestos and other contaminants to soil, groundwater, and surface water including the eyesore of wind blown debris). Please consider other sites with less risk to human heath and environment.

Subject: Screening

Shane:

This is a follow-up to our earlier discussion regarding screening the monofill from the section line easements. MSB 17.60.110(A) states *"No junkyard or auto wrecking yard shall be established or operated unless the wrecking yard is completely obscured from the view of any traveled or public right-of-way. the permit may require the junkyard or auto wrecking yard not within a building to be contained within a continuous solid fence no less than eight feet in height. if such requirement is necessary to prevent the unsightly display of the yard or for public safety purposes. Fencing may be of one or a combination of the following:*

(1) conventional solid wood or metal fencing;
(2) evergreen or other natural planting sufficient to provide year-round screening; and
(3) earthen berm or topography.

MSB 17.60.110(B) states *"In all cases, fencing provided shall be continuous and of sufficient density to provide visual screening required by this chapter on a year-round basis".*

Please let us know how you plan on providing year-round screening of the monofill operation from the section line easements, as this issue will have to be addressed in the staff report.

Subject: Update and adder
Attachments: 2014 Canaday ADEC Inspection.pdf

Susan,

I was wondering if I could get an update on the status of our CUP application? Everything still on for Dec 1st?
Not waiting for anything from us?
Any new concerns been raised?
What is the time frame for public notice?

I would also like to submit the attached ADEC inspection report. Many people at the last hearing made comments that the ADEC does not inspect monofills. This proves they do inspect and further more we are proud of getting a perfect score on the inspection of our existing facility in Salcha. This proves we are a good operator.

The only negative with this report was ADEC noted they had received a complaint from a neighbor about traffic, road conditions, etc. upon investigation we found out the trucks the neighbor had complaints about were State of Alaska trucks that were improving Canaday Road, which is state maintained. The complaint although directed at our operation was with something not affiliated with our facility and ADEC took no action.

If you have any questions or need anything more from us please don't hesitate to ask.

Respectfully,

Shane Durand

Re: September 09, 2014 Inspection of Salcha Canaday Road C & D Monofill, Permit #SWZA063-17

Dear Mr. Jacques:

The Alaska Department of Environmental Conservation Solid Waste Program (ADEC) completed its first annual inspection of the Salcha Canaday Road C & D Monofill on September 09, 2014. I would like to thank Sean Holland for assisting me with the inspection.

The facility is being managed and operated excellently and received a compliance score of 100% during this year's inspection. Great Job! Specific details of the inspection are provided in the enclosed inspection checklist.

The Regulated Asbestos Containing Material (RACM) cell was nearly completed at the time of the inspection and has likely been completed. However, since the cell was not completed at the time of the inspection and RACM was not being received, the questions in the inspection checklist pertaining to RACM were not scored since they were not applicable at the time. During next year's inspection, these sections will be applicable.

Thank you for running a great operation. If you have any questions about this letter or the enclosed inspection checklist, please contact me by telephone at 907-451-2134 or by email at neil.lehner@alaska.gov.

Sincerely,

Neil Lehner

Alaska Department of Environmental Conservation
Division of Environmental Health
Solid Waste Program

Part One: ADEC Information Gathering

This section should be filled out completely, prior to the site visit. This section is not scored, but the information will be used during the site visit to determine compliance with requirements.

#	Part One: ADEC Information Gathering
1	**PERMIT AND OPERATING PLAN** – Review permit and operating plan to familiarize yourself with the requirements and approved operations for this landfill. Does the facility have a current ADEC permit? [X] Yes [ ] No Permit Number: SWZA063-17 Expiration Date: 6/17/2017
2	**SITE/DEVELOPMENT PLANS** – Review site plans and development plans to familiarize yourself with the approved layout of the landfill and the conditions at the site. Check the conditions that exist at the landfill: [X] Is the landfill located in or near wetlands? [X] Is the landfill located on permafrost? (It is in a general area of discontinuous permafrost) [ ] Is the landfill located in a 100-year floodplain? [ ] Are there any drinking water wells within 500 feet of the landfill property boundary? Has a current/up-to-date site map been submitted? Yes
3	**PREVIOUS INSPECTIONS** – Review previous inspection forms. List any issues that may still be outstanding that should be investigated. This is the first inspection.
4	**COMPLAINTS** – If ADEC has received any complaints regarding the facility, list and describe them below: One complaint was received in June. The individual was concerned with the truck traffic and degradation to the road and also concerned with the number of trucks going to the site. Individual also reported trucks arriving later in the evening.
5	**AUTHORIZED WASTE TYPES** – *The landfill is required to have a permit that authorizes all types of waste disposed at the site.* Check the types of waste that the facility is authorized to dispose: [X] Inert or C&D Waste [X] Regulated Asbestos Containing Material (RACM) *(Must be disposed in separate cell)* [ ] Other
6	**SIGN REQUIREMENTS** – *Many permits require signage that identifies the owner or operator, hours of operation, emergency contacts, or other information.* List any signage requirements specified in the permit:

Inert Waste Monofill Inspection Checklist

Alaska Department of Environmental Conservation
Division of Environmental Health
Solid Waste Program

#	Part One: ADEC Information Gathering
7	**LAND OWNERSHIP** – *The landfill application must contain documentation that the operator is the landowner, or that the operator has obtained authorization from the land owner.* Central Monofill Services is the landowner, Central Recycling Services is now the operator Check the appropriate box. [ ] The operator is the landowner [X] The landowner has authorized the landfill
8	**WAIVERS** – *The landfill may obtain waivers for requirements related to development or operation.* List any ADEC-approved waivers: None
9	**MONITORING REQUIREMENTS** – *A facility may be required to monitor groundwater or surface water. Requirements are specified in the permit or approved monitoring plan. By regulation, monitoring reports must be submitted to ADEC for groundwater and surface water. This information will help you determine if the operating record is complete.* Check the types of monitoring that the facility is required to conduct, note the required sampling frequency, and check if reports must be submitted to DEC:
10	**MONITORING LOCATIONS** – *Sampling must be conducted at approved wells or sites. Locations are specified in the monitoring plan.* Make a copy of a site plan or map that shows the locations of monitoring wells, surface water sampling sites, or other approved monitoring locations. Take the map with you to assist in field inspection.
11	**ADDITIONAL PERMIT REQUIREMENTS** List any additional permit requirements that are not addressed in the inspection checklist. 1. Notify ADEC when large quantities of RACM are accepted 2. Submit updated site development plans by Dec. 31 each year 3. Notify ADEC before the amount of waste deposited exceeds the annual expected average

✓	Type	Sampling frequency	Report to DEC required?
	Groundwater		
	Surface Water		

Part Two: ADEC Records Review

This section should be completed and scored in the office, prior to conducting the site visit.

Inert Waste Monofill Inspection Checklist

Alaska Department of Environmental Conservation
Division of Environmental Health
Solid Waste Program

#	Part Two: ADEC Records Review	POINTS Possible	POINTS Score
1	**FEES** – *The landfill is required to pay annual and other fees to ADEC.* 18 AAC 60.700 Is the facility current on payment of all fees? [X] Yes [ ] No Date of last payment: 12/26/13 OR Amount owed:	5	5
2	**MONITORING REPORTS** – *A facility may be required to monitor groundwater or surface water. Groundwater and surface water reports MUST be submitted to ADEC.* ***NOTE to Inspector:*** *The project manager should be reviewing and communicating about monitoring reports as they are received.* 18 AAC 60.810, 18 AAC 60.830, permit condition Is Monitoring required? If so, does the facility submit the required monitoring reports to ADEC? Do monitoring reports address all required types of monitoring? Are monitoring reports complete and contain required analyses?	NA	NA
3	**FINANCIAL ASSURANCE** –*The landfill may need to demonstrate financial assurance to cover closure and post closure costs if monitoring is being done. The local government financial test is the most commonly used mechanism. Some financial assurance mechanisms require an annual update.* 18 AAC 60.235, 18 AAC 60.265 Check the type of financial assurance used : [ ] Local government financial test (requires annual update) [ ] Corporate financial test (requires annual update) [ ] Trust Fund [ ] Surety Bond guaranteeing payment or performance [ ] Letter of credit [ ] Insurance [ ] Corporate guarantee [ ] Local government guarantee [ ] Other state-approved mechanism What is the date of the latest financial assurance documentation?	NA	NA

Part Three: Landfill Records

This section should be completed at the landfill facility during the site visit.

Inert Waste Monofill Inspection Checklist

Alaska Department of Environmental Conservation
Division of Environmental Health
Solid Waste Program

#	Part Three: Landfill Records	POINTS Possible	POINTS Score
1	**PERMIT** – *A copy of the permit application and current permit must be kept in the operating plan.* 18 AAC 60.235 Is a copy of the permit application and current permit in the operating record? Yes	10	10
2	**OPERATIONS PLAN** – *The operations plan should be used as a guide for day to day operation of the landfill. A copy must be kept in the operating record.* 18 AAC 60.210, 18 AAC 60.235, permit Does the operating record contain a copy of the operations plan? Yes	10	10
3	**TRAINING** – *Landfill staff must receive training to recognize regulated hazardous waste and PCB waste. Records of training must be kept in the operating record.* 18 AAC 60.240 Does the landfill have a record showing that operators have received training to recognize regulated hazardous waste and PCB waste? Yes. All staff are current on multiple trainings including HAZWOP, Asbestos Abatement, HAZMAT	5	5
4	**RANDOM INSPECTION RECORDS** – *The landfill must perform random inspections of incoming waste loads to identify any regulated hazardous waste or PCB waste. Records of the inspections must be available for review.* 18 AAC 60.235, 18 AAC 60.240 Are random waste inspections performed and recorded? Yes. All loads are inspected as they are loaded and unloaded. A building survey is always done at site and recorded.	20	20
5	**ASBESTOS RECORDS** – *The landfill must maintain asbestos shipment records for each load of RACM. Records must include contact information for the waste generator and waste transporter, the amount (cy) disposed, and the date of receipt. The landfill must maintain an up-to-date map or site plan showing the boundaries of the asbestos cell. The landfill must maintain up-to-date records of the amount of waste in the RACM cell, including depth and the total volume.* 18 AAC 60.450 **The permit was modified to include a RACM cell. However, no RACM has been received at the site yet so this is still Not Applicable until RACM is received.** Does the landfill maintain complete asbestos shipment records for each load of RACM received? Does the operating record contain an adequate, up-to-date map of the asbestos cell? Does the operating record contain up-to-date information about the depth and total volume of RACM in the asbestos cell?	NA	NA

Inert Waste Monofill Inspection Checklist

Alaska Department of Environmental Conservation
Division of Environmental Health
Solid Waste Program

#	Part Three: Landfill Records	POINTS Possible	POINTS Score
6	**VISUAL MONITORING** – *Visual monitoring must be performed at least monthly and recorded on a form approved by ADEC. Records must be maintained for at least 5 years.* 18 AAC 60.800 Does the operating record contain copies of monthly visual monitoring reports? Yes, since opening [X] Violations of permit conditions, or regulatory requirements [X] Settlement [X] Ponding [X] Leakage [X] Thermal instability (permafrost landfills only) [X] Frost action [X] Erosion [X] Signs of damage to due to operations [X] Damage to monitoring devices [X] Escape of leachate [X] Escape of waste [X] Unauthorized waste disposal [ ] Wind blown litter [X] Damage to a containment structure, retaining wall, erosion control, or diversion structure [X] Fire or combustion in the waste [X] Impacts to fish, wildlife, or vegetation [ ] Any other conditions that threaten public health or the environment:	10	10
7	**COST ESTIMATES AND FINANCIAL ASSURANCE** – *The landfill may need to update closure and post closure cost estimates annually to adjust for inflation. The landfill may need to demonstrate financial assurance to cover closure and post closure costs if monitoring is being done. The local government financial test is the most commonly used mechanism. Documentation must be kept in the operating record. Some financial assurance mechanisms require an annual update.* 18 AAC 60.235, 18 AAC 60.265 Does the operating record contain appropriate and up-to-date (i.e. annual) closure and post-closure cost estimates? Does the operating record contain appropriate and up-to-date financial assurance documentation? What is the date of the latest estimate? _____	NA	NA
8	**AS-BUILT DRAWINGS** – *The facility is required to maintain as-built drawings in the operating record.* 18 AAC 60.235 Does the operating record contain as-built drawings? Yes	5	5

Inert Waste Monofill Inspection Checklist

Alaska Department of Environmental Conservation
Division of Environmental Health
Solid Waste Program

#	Part Three: Landfill Records	POINTS Possible	POINTS Score
9	**MONITORING PLAN** – *If the facility is monitoring groundwater or surface water, it needs a plan to be kept in the operating record.* 18 AAC 60.810, 18 AAC 60.830 Is the facility required to monitor surface water or groundwater? If so, is the monitoring plan in the operating record?	NA	NA

Part Four: Landfill Development

This section should be completed at the landfill facility during the site visit.

#	Part Four: Landfill Development	POINTS Possible	POINTS Score
1	**LANDFILL DEVELOPMENT** – *The facility is required to follow the approved landfill site plans and development plans. If minor changes are made, they should not be detrimental to regular operations. Any major changes must be approved by ADEC.* 18 AAC 60.233, 18 AAC 60.210, permit Is the facility following the site and developments plans? Yes If any minor changes have been made, are they detrimental to operations? NA Is the waste disposal area at least 50 feet from the property boundary? Yes	30	30
2	**WATER WELLS** – *Waste may not be disposed of within 500 feet of a drinking water well. If any wells exist within 500 feet of the property boundary, the site must be developed and operated to ensure that waste is not deposited too near the wells.* 18 AAC 60.040 A new survey indicated that a drinking water well identified on the previous surveys was actually not a well. Therefore, no drinking water wells are located within 500 feet of the landfill boundary. Has development of the landfill or surrounding area impacted this separation zone?	NA	NA

Part Five: Access

This section should be completed at the landfill facility during the site visit.

#	Part Five: Access	POINTS Possible	POINTS Score
1	**SIGNAGE** – *A clearly legible sign must be posted at the entrance to the landfill. The sign must prohibit disposal of regulated hazardous waste and polychlorinated biphenyl (PCB) waste. Most permits also require signage that identifies the owner or operator, hours of operation, and emergency contacts.* 18 AAC 60.240, permit Are signs prohibiting hazardous waste and PCB waste posted and clearly legible? Yes If additional signage is required, is it posted and clearly legible? Yes Do the existing signs meet all of the requirements noted in Part One, Question 6? Na	5	5

Inert Waste Monofill Inspection Checklist

Alaska Department of Environmental Conservation
Division of Environmental Health
Solid Waste Program

#	Part Five: Access	POINTS Possible	POINTS Score
2	**ACCESS** – *Access to the landfill facility must be limited by the use of fencing, berms, or natural barriers to control public access to the site. This should prevent unauthorized traffic or dumping.* 18 AAC 60.220 Is access to and within the facility limited? Yes. Locked gates at entrance. Is there any evidence of unauthorized access to the landfill (target shooting, off-road vehicles, etc) No Is there any evidence of dumping outside the permitted areas? No	20	20

Part Six: Working Cell Operations

This section should be completed at the landfill facility during the site visit.

#	Part Six: Working Cell Operations	POINTS Possible	POINTS Score
1	**AUTHORIZED WASTE TYPES** – *The landfill is required to have a permit that authorizes all types of waste disposed at the site.* 18 AAC 60.200 Is there evidence that the facility has accepted or is accepting any wastes that are not addressed or authorized in the permit? *(See answers in Part One, Question 5)* No	20	20

Part Seven: General Operations

This section should be completed at the landfill facility during the site visit.

#	Part Seven: General Operations	POINTS Possible	POINTS Score
1	**LITTER** - *Litter must be controlled so that it does not become a nuisance or hazard and must be removed from access roads and other areas of the facility.* 18 AAC 60.233, 18 AAC 60. Is excessive litter evident at or near the landfill? No, none at all. Check the types of measures that are used to control litter at the landfill: [X] Litter fencing [ ] Litter collection [ ] Other _____	5	5
2	**DUST, ODOR, NOISE, ETC.** - *Dust, odor, noise, traffic, and other effects from the landfill must not become a nuisance or hazard to the public health, safety, or welfare.* 18 AAC 60.233 Are dust, odor, noise, traffic or other effects from the operation causing, or likely to cause, a nuisance to neighboring homes or businesses? No.	5	5

Inert Waste Monofill Inspection Checklist

Alaska Department of Environmental Conservation
Division of Environmental Health
Solid Waste Program

#	Part Seven: General Operations	POINTS Possible	POINTS Score
3	**SALVAGING** - *Public salvaging, if allowed, must be limited to an area that does not hinder facility operation, create a safety hazard, or cause pollution.* 18 AAC 60.220 This facility does not have any public salvaging. CRS (the operator of the landfill) does have a nicely organized laydown/reuse area where reusable/recyclable materials are stored. These materials are used by the company on other projects or sold. Is public salvaging restricted to a controlled area away from the working face? Is the salvage area managed with respect to safety and pollution control?	NA	NA
4	**DISEASE VECTORS AND ANIMALS** - *Disease vectors, including wildlife and domestic animals, must be controlled so that the public health, safety, or welfare are not endangered by the spread of disease or contact with animals, and that the animals are not harmed by contact with the waste or become a nuisance.* 18 AAC 60.230 Is there any evidence (prints, scat, digging, etc.) of bear, fox, or other animals around the waste? No Were there excessive numbers of birds present? None Are there any reports of wildlife being harmed, or conditions that are likely to harm wildlife? No	5	5
5	**INACTIVE AREAS** - *Areas that have not received waste for more than 90 days, but have not yet reached the final capacity or elevation, must receive an intermediate cover. The area must be covered with 12 inches of soil and graded to prevent ponding and erosion.* 18 AAC 60.243 Have inactive areas been appropriately covered and graded? Yes	10	10
6	**MAINTENANCE AND REPAIR** - *The landfill must maintain structures and components of the facility, and repair any structural changes or damage to the facility.* 18 AAC 60.815 Are there signs of damage to any component of the facility? No	10	10

Part Eight: Special Waste

This section should be completed at the landfill facility during the site visit.

Inert Waste Monofill Inspection Checklist

Alaska Department of Environmental Conservation
Division of Environmental Health
Solid Waste Program

#	Part Eight: Special Waste	POINTS Possible	POINTS Score
1	**RACM CELL-** *If the facility accepts RACM, it must be disposed of in a separate cell. Access to the asbestos site must be restricted, and there must be no visible emissions.* 40 CFR 61.154 *Asbestos loads must be inspected and handled to insure that all friable asbestos is sealed in leak-proof containers, deposited in the asbestos cell without damaging the containers, and covered by the end of the day with 6 inches of soil.* 18 AAC 60.450 **This question is currently not applicable but will be once RACM is received** Is RACM disposed of in a separate cell from MSW? It will be once it is received. Is there evidence of visible emissions? NA What measures are used to prevent public access to the asbestos disposal area? The site is not open to the public, locked gate at entrance, asbestos cell will be completely fenced with required signage. Are any exposed or broken bags evident? NA Has adequate cover been applied to the waste? NA	NA	NA
2	**NON-RACM HANDLING** - *Non-RACM waste must be handled so that it does not become friable. It must be covered within 24 hours using procedures that prevent the release of asbestos fibers.* 18 AAC 60.450 Does the facility handle non-RACM waste so that it does not become friable and does the facility cover it within 24 hours? Yes	10	10
3	**LIQUID WASTE** - *Liquid waste may not be disposed at the landfill, with the exception of small quantities (one gallon or less) of containerized household waste. This includes leachate and baler squeezings, unless recirculation has been approved under an RD&D permit.* 18 AAC 60.420 Are any prohibited liquids disposed at the landfill? No Are any fluids generated at the landfill (leachate or baler squeezings)? No If so, how are they disposed? Na	10	10
4	**VEHICLES** - *Vehicles may not be disposed at the landfill unless all fluids and batteries have been removed. If undrained vehicles, or the fluids and batteries removed from them, are stored at the landfill for later disposal or recycling, they must be managed to prevent release of fluids.* 18 AAC 60.035, 18 AAC 60.010 Are vehicles disposed at the landfill? No Are all fluids and batteries removed prior to disposal? Na	NA	NA

Part Nine: Surface Water Controls/Impacts

This section should be completed at the landfill facility during the site visit.

Inert Waste Monofill Inspection Checklist

Alaska Department of Environmental Conservation
Division of Environmental Health
Solid Waste Program

#	Part Nine: Surface Water Controls/Impacts	POINTS Possible	POINTS Score
1	**RUN-ON/RUN-OFF** - *The landfill must have a control system to prevent run-on water from flowing into the active cell.* 18 AAC 60.225 Does the control system prevent run-on from flowing into the active cell? Yes Is there evidence that run-off may be impacting nearby waters? No	10	10
2	**SURFACE WATER AND PONDING** - *Waste may not be placed in surface water, including ponded rainwater. Landfill surfaces should be graded to prevent ponding, and all ponded water must be removed within 30 days.* 18 AAC 60.225 Is there any evidence of waste in contact with surface water, including ponded rainwater? No	5	5
3	**LEACHATE SEEPS** - *Leachate seeps must be prevented, or contained and controlled at the boundary of the waste management area if the department finds it necessary.* 18 AAC 60.225 Has the department found it necessary to contain or control leachate seeps? No Are there any visible leachate seeps outside the landfill cell? No What measures have been taken to contain and control the seeps? Na	30	30
4	**PERMAFROST** - *If the landfill is located on permafrost, it must be designed and operated so that the permafrost remains frozen. If the landfill settles and water is pooling, the operator must take corrective action.* 18 AAC 60.227 Are there any indications that permafrost is thawing (pooled water or settlement)?	NA	NA

Part Ten: Monitoring Locations

This section should be completed at the landfill facility during the site visit.

#	Part Ten: Monitoring Locations	POINTS Possible	POINTS Score
1	**MONITORING LOCATIONS** – *Monitoring, if done, must be conducted at approved locations. Surface water monitoring sites must be properly maintained. Groundwater monitoring wells must be properly maintained.* 18 AAC 60.810, 18 AAC 60.825, permit Are surface water monitoring sites clearly identified and marked? Are surface water monitoring sites located according to the approved plan? Are monitoring wells in good condition and locked? Are other monitoring devices well maintained and located as required?	NA	NA

Part Eleven: Additional Permit Requirements

This section should be completed at the landfill facility during the site visit.

Inert Waste Monofill
Inspection Checklist

Alaska Department of Environmental Conservation

SUBJECT: **Central Monofill Services Conditional Use Permit Application**
LOCATION: 17N02E18C010 & 17N02E19B006

Dear Mr. Durand:

This letter is a follow-up to the conversation that Alex Strawn and myself had with you today regarding the CMS conditional use permit application. We discussed the possibility of section line easements adjacent to the south and west sides of the above referenced property (See attached map). Since we spoke you sent us an e-mail stating that the title policy says *"Reservation of section line easement 33 feet in width along each side of the section line as provided by 43 U.S.C.932"*. However, this does not specify if this the north/south or east/west section line easement or both. A verification of section line easement(s) will need to be provided by a registered land surveyor.

In addition, we discussed the requirement to obtain an MSB Permit for Construction within Public Easements & Rights-of-Way to conduct any work within a section line easement. This permit will require a survey to determine the width of the section line easement and will require that the easement be left in a condition in which a road can be constructed. An application form is attached for your use. If you have any questions regarding this application please contact the MSB Right-of-Way Coordinator, Andy Dean, at 861-7803.

We also discussed that should the conditional use permit be a approved, a condition of approval would be that the section line easement(s) be vacated prior to any work being conducted within them.

Should you have any questions or require additional information please let me know.

Sincerely,

Susan Lee

Subject: RE: Potential easement on section line

There is nothing in the Title Report for this. We have had locates done on the property and they do not have any underground lines on the property or section line.

Hi Shane,

The attached DNR case file abstract indicates that there may be a private easement along the east-west section line easement.

Zoom to the project area using the following link and you will see the easement.

SUBJECT: **Central Monofill Services Conditional Use Permit Application**
PROPERTY ID#: 17N02E18C010 &17N02E19B006

Dear Mr. Durand:

Borough staff has reviewed the application material for the proposed monofill on the above referenced property and have determined that the following information will need to be submitted and/or clarified before we can process the conditional use permit application:

1. The Borough hired J.A. Munter Consulting, Inc. to review the application material. A copy of Munter's report, dated February 7, 2014, is attached for your review and comments. In addition to specific issues outlined below, address all issues raised in the Munter report.

2. The application material states "*There are three industrial ponds located on the northern half of the property which cover 66 of the acres*". "*Of the remaining 52 acres, the monofill footprint is proposed to be 35.5 acres with 16.5 acres used for recycling operations*". "*The CUP is needed for 52 acres of the property*". The site plan does not depict the conditionally permitted area. The proposed permitted area is irregular and does not correspond to lot lines. A surveyed delineation of the 52 acre boundary must be shown on the site plan. MSB 17.60.040(B) *Site Plan* requires "*the specific location of the use or uses to be made of the development shall be submitted with the application*".

3. Do you have a drainage plan for this site? If so, provide a copy. For example, what direction will material flow off the monofill? What direction will surface water be draining during construction of the monofill? MSB code section 17.60.040(B) *Site Plan*, states that "*drainage*" must be shown on the site plan.

4. Is there a SWPPP (Storm Water Pollution Prevention Plan) for this site? If not, explain why one is not required?

5. Please address the State of Alaska, Department of Transportation's plans for widening the Glenn Highway and placing an intersection at Colleen Street and how that might affect this project.

6. Provide a copy of the wetlands review performed by Hemlock Scientific, as addressed on Page 15 of 38 of the application material.

7. Page 16 of 38 states *"Water level data is being shared with Alaska Department of Natural Resources for regional study of ground water table elevations"*. Provide a copy of all water level data that you have submitted to ADNR in regard to this project.

8. Page 17 of 38 states *"Alaska Department of Environmental Conservation (ADEC) reviewed the CMS Monofill Permit application for this site and has approved the permit conditioned upon receipt of the MSB CUP"*. ADEC has indicated to the borough that the permit has not been approved (See attached e-mail from ADEC). Please clarify and provide a copy of any approved ADEC permit.

9. Page 21 of 38 states "*The adjoining residential lots are screened from view of the property by trees*". Page 28 of 38 states "*The vegetation that is remaining on site is the forest located along the top of the mined banks and helps create a visual barrier between the public and the CUP activities. The existing trees will be left in place and used as a visual and noise buffer*". The monofill goes to the top of the bluff. It is not appropriate to use adjacent properties for the buffer. Any buffer should be located on your property. Provide a plan for buffering the neighboring properties as the monofill is built up and out towards those properties.

10. Page 22 of 38 states *"per the ADEC permit municipal and household waste will not be accepted at the facility"*. Provide a specific list of materials that can be accepted at the facility. For example, are the following items part of the residual material being deposited in the monofill: pressure treated wood, containers that contain residual materials, drywall, lead paint, formaldehyde containing materials, glues, mastics, and adhesives. What is the volume of residual material accepted? Are residues not considered hazardous due to their volume compared to the total cumulative volume?

11. Page 22 of 38 states *"Loads hauled into the facility that have not been previously inspected by CRS personnel will be dumped onto a lined pad for inspection"*. Page 35 of 38, #4, also states *"All waste delivered directly to the monofill is first placed within a lined area and inspected"*. Page 29 Sequence of Fill, does not address the separate inspection area. It states that trucks will place their loads in the operational cell. Page 37 of 38, #12, does not discuss this lined inspection pit as a non-permeable surface at the site. Clarify these inconsistencies and explain what is the actual process. Is the lined pad nonpermeable? In addition, will this inspection pad be moved around the site or will it remain in the same place so that it can be shown on the site plan?

12. Page 22 of 38 discusses the inspection pad that will be capped with 2" of soil. What is the plan for disposal of this soil? Will this soil be tested prior to its disposal or use? What is the plan for managing the run-off coming from the inspection area?

13. Page 22 of 38 discusses the careful handling of "hazardous wastes". The proposed monofill proposes to exclude "hazardous waste". It is not clear what this means and in

particular, that all waste that may be hazardous to water supplies will be excluded. Provide a specific list of everything that is tested for in the Building Material Survey.

14. Page 22 of 38 states that CRS and CMS have specific policies outlined in the Operations Plan. Provide a copy of the CRS and CMS Operations Plan.

15. Pages 22 - 23 of 38 states in part *"suspect materials delivered to CRS are tested and, if found, removed from the waste stream..."*. What criteria will be used to determine suspect materials?

16. Page 23 of 38 states *"suspect material will be tested in accordance with regulatory required test methods to identify hazardous materials content, if any"*. How regularly will Toxicity Characteristic Leaching Procedure (TCLP) occur? Does visually seeing paint make it "suspect"? Will any materials with lead paint be accepted?

17. Page 23 of 38 regarding asbestos. Asbestos will be placed in plastic bags which heavy equipment can perforate. Asbestos does not dissolve, however, it does become easily airborne. The fences proposed to stop blowing trash on a windy day will do nothing to stop asbestos. What type of fence will surround the asbestos cell? What is your policy for handling RACM during the wind?

18. Page 30 of 38 states *"Other materials deposited into the monofill are placed within the cells and will be covered intermittently, however not necessarily daily"*. Page 18 of 38 states *"Regularly covering the waste with soil further prevents blowing debris"*. What is meant by "covered intermittently" and "regularly covering"?

19. Page 31 of 38 states *"the ADEC permit requires the owner to provide bonding or other financial assurance to cover the cost of monofill closure"*. CMS also claims that it has *"sufficient Environmental and Pollution Insurance to cover this project"*. Provide copies of the bond, insurance policy and certificate of insurance.

20. Page 34 of 38 Hours of Operation. How will CMS be handling hours of operation during the Alaska State Fair?

21. What will be the actual maximum height of the finished monofill above the bottom of the cell?

22. What is the maximum square footage that will be exposed and not covered at any one time during the operation of the monofill?

23. Has the site been evaluated for impacts that would occur from a large earthquake, including, but not limited to susceptibility to liquefaction, potential changes in hydrology, i.e. raised water levels, and impacts on the tire bale structure?

24. What is the fire preparedness plan for this site? What would be the impacts from a fire and how would you address them?

25. Based on the application material and information in the February 7, 2014 Munter report, staff has determined that a Core Area Conditional Use Permit is required, per the requirements of MSB 17.61. Page 3 of 14 of Munter's report states in part *"... it would be*

reasonable to assume that there will be a sufficient amount of waste accumulated to generate leachate that will exceed one or more drinking water Maximum Contaminant Levels." In addition the report states in part *",,,it is highly likely to result in measurable increases in contaminants beneath the facility and for some distance downgradient."* A Core Area Conditional Use Permit application form is attached for your use.

26. Staff is currently researching whether or not the tire bale walls and monofill constitute a structure and are subject to the setback requirements in MSB 17.55 – Setbacks. We will forward our determination to you as soon as it is complete.

Once this information has been submitted and determined to be complete, the public hearing will be scheduled. Should you have any questions or require additional information please contact me at the above address, phone# 861-7862 or e-mail: slee@matsugov.us.

Sincerely,

Susan Lee

Subject: Comment: Central Monofill Services Conditional Use Permit

The Alaska Department of Environmental Conservation (ADEC) Solid Waste Program has been asked to submit official comment on the Central Monofill Services (CMS) Matanuska Susitna Borough (MSB) Conditional Use Permit (CUP) Application.

On page 17of 38 of the CMS MSB CUP application it states:
Alaska Department of Environmental Conservation (ADEC) reviewed the CMS Monofill Permit application for this site and has approved the permit conditioned upon receipt of the MSB CUP.

This issue was addressed in the application by CMS in response letter to you , dated May 12, 2014.

The ADEC Solid Waste Program has reviewed the CMS Inert Waste Monofill Permit application submitted January 12, 2013, including additional information submitted January 23, 2013. ADEC Solid Waste determined that the application was complete, and posted a public notice in the Frontiersman on March 12 & 15, 2013. No comment was received on the public notice.

Due to an error in the original public notice, which excluded the permitting of an Asbestos waste cell at the monofill, ADEC will be publishing an additional 30-day public notice in the near future.

At this time, NO DECISION has been issued by ADEC on the CMS Inert Waste Monofill Permit application other than it is complete based on our January 2013 regulations.

Thank you,
Lori

Subject: RE: URGENT: DEC correction on misstatements about approval of monofill design

Below is a copy of the email sent to CMS & MSB in March 2014. Please note that CMS responded appropriately in their application materials to this issue on March 12, 2014.

CMS MSB CUP Application

From	Aldrich, Lori (DEC)	**Date**	March 7, 2014 at 7:51:00 PM EST
To	Shane Durand ; Stuart Jacques		
Cc			
Bcc	Susan Lee		
Subject	CMS MSB CUP Application		

Shane and Stuart,

I was sent a copy of the Matanuska-Susitna Borough (MSB) Conditional Use Permit (CUP) Application. It included additional information that had not been previously submitted to ADEC. I did a brief review of the application. Although, this is not an official review of the application, I do have some comments regarding some of the language and information in the CUP application as it relates to the Inert Waste Monofill Permit Application submitted to ADEC.

CUP Application

Page 16 – These wells and monitoring plan are not required by ADEC but will allow CMS to monitor the groundwater for any concerns long term.

See comment below on Groundwater Monitoring Plan

Page 17 - Alaska Department of Environmental Conservation (ADEC) reviewed the CMS Monofill Permit application for this site and has approved the permit conditioned upon receipt of the MSB CUP.

ADEC has NOT APPROVED the permit – the permit application was deemed complete and a public notice was issued. ADEC also noted, in discussions with CMS, that if any significant changes were made to the permit application information in regard to the requirements of the Conditional Use Permit (CUP) issued by MSB a new complete ADEC monofill application would need to be submitted, including a new public comment period.

Page 28 - More than 70% of the existing monofill footprint is already in excess of 10' above the seasonal ground water table. Those areas with insufficient separation from ground water will be filled with onsite earthen materials to obtain a minimum separation of 10'.

The original permit application indicated that the low point of the monofill was more than 10 feet above the groundwater table. In discussions, CMS indicated that additional groundwater studies would be performed in May 2013 to determine the seasonal high groundwater levels, and the reports submitted to ADEC. The groundwater contours were developed from data collected on July 13, 2013, which would identify seasonal low groundwater levels. In addition, no discussion of fill to attain the proper groundwater separation was discussed. If areas are filled, you will need to resurvey the site and submit a new drawing of the present conditions.

Page 31 - The ADEC permit requires the owner to provide bonding or other financial assurance to cover the cost of monofill closure. The ADEC has a predetermined method for calculating the amount required for the bond or other financial assurance to make sure it is enough to cover all closure costs. CMS has met this obligation as part of the ADEC permit.

CMS has not presented adequate financial assurance to meet this requirement, and we would not expect CMS to submit this until ADEC had determined that a permit would be issued or denied. This will be based on a final review of the application and any other information gathered regarding the site conditions and facility plans.

Page 33 - ADEC has approved the proposed monofill design pending receipt of the MSB CUP.

ADEC has determined that the monofill design package is complete, but has not issued an approval for the design.

Maddox & Associates Report

Pg B-29 – states "the planned elevation of the bottom of the inert refuse in the monofill is a minimum of 10-feet below the normal seasonal high [water table].

Above, the CUP text indicates that this is not true, based on the ADEC monofill permit application, which does not include fill.

Groundwater Monitoring Plan

If CMS will be performing Groundwater monitoring at the site, a Groundwater Monitoring Plan that meets the conditions of 18 AAC 60.820-860 must be submitted to and approved by ADEC. This would be considered a significant change to the landfill operations.

RACM Cell

As I believe you were informed, the original Public Notice by ADEC did not include mention of the RACM cell. The only possible correction would be to issue an additional public notice if you will include a RACM cell at the monofill. I thought we had communicated to you and suggested that, if ADEC did permit the monofill, you might wait to begin a RACM cell at the site, and we could make the necessary permit modifications (including a public notice) at that time. In addition, we are somewhat concerned regarding comments on the wind issues at the site and our ability to permitRACM disposal.

If you have any questions or wish to discuss the comments, you can contact me after March 17. I will be out of the office in training all next week.

Thanks,

Lori

Subject: Re: URGENT: DEC correction on misstatements about approval of monofill design

Hi Lori,

I trust you are doing your best, and I appreciate your quick responses.

I do think it's relevant (and good government) that ADEC straighten out the record given that this matter is in front of a government body that will be deliberating using the official record. There are misstatements in that record that ADEC has approved the permit and no corresponding statement from ADEC to the contrary.

Sending a letter or email to the borough simply ensures that everyone is on the same page and has the correct information straight from ADEC and can refer to that if questions arise.

Thank you,

Stephanie Nowers

Actually, now that you mention it, I may have sent an email to Susan Lee. I was searching for one sent to CMS. Unfortunately I do not currently have access to my email archives. I will check when access is available. It may also be quoted in a frontiersman article if you check those.

It was reiterated several times to several sources, but as we did not do a formal review of the CUP application, and, it is irrelevant until we make a permit decision, it was not documented to the file.

Thank you,
Lori

Hi Lori,

I hate to be a bother. But ADEC, as a state agency, needs to be clear about its record and actions.

Central Monofill Services' repeatedly states in their application to the Mat-Su Borough that they have ADEC approval for their monofill design. From what you say in your email below, this is not true.

I think it is incumbent on ADEC to correct the record and send a formal statement to the Mat-Su Borough and CMS to make sure the record is clear for all involved. Saying you corrected CMS' misstatements verbally with no record of that communication is not a clear record.

I also believe it is incumbent on ADEC to send this formal statement to the Mat-Su Borough before the Oct. 31 deadline for comments so that it is part of the official record to the Mat-Su Borough Planning Commission and they are operating with correct and true information. This can be done simply by sending a letter to Mat-Su Borough Planner Susan Lee who is in charge of collecting comments at slee@matsugov.us

Below are cited some but perhaps not all of the references in CMS' application where they state they have ADEC approval. This can all be confirmed by looking at CMS' application which is online at the Mat-Su borough website.

Thanks Lori. And sorry again to be a bother since I know you are busy. I have copied Bob as your email indicated you might not be checking your email regularly this week and there is a public comment deadline looming.

907.229.1982

2nd page of CMS application intro Letter: "CMS submits this CUP application and attachments to address the requirements described in MSB 17.60 and other requests made by staff. The MSB does not have design standards or specific CUP standards for a recycle facility or monofill. The facility has been designed to meet the State of Alaska DEC standards for an inert waste monofill. ADEC has approved the proposed Monofill design."

Page 17: "Alaska Department of Environmental Conservation (ADEC) reviewed the CMS Monofill Permit application for this site and has approved the permit conditioned upon receipt of the MSB CUP."

Page 33: "Alaska Department of Environmental Conservation (ADEC) reviewed the CMS Monofill Permit application for this site and has approved the permit conditioned upon receipt of the MSB CUP."

Screenshot below from Page 282, the borough asks specifically about the ADEC permit and CMS responds maintaining they have approval and have met the requirements for the monofill.

Stephanie,

ADEC has never issued any approval of the design. At the time we first went to public notice, we agreed that the application and the design met the regulations, as presented. The purpose of the public notice was to identify any items that might have been at issue in our understanding of the conditions and potential impacts of the site. If no additional information had surfaced, and the retesting of the groundwater elevations had confirmed the distance to groundwater, we could have issued a permit for the facility without the asbestos cell, which would have been conditioned upon

receiving the MSB Conditional Use Permit. However, since that appeared to be the larger hurdle, we chose to wait until they completed the CUP rather than research the information collected. Since CMS has submitted updated site conditions (survey) and we need to add the question of the asbestos cell, the new public notice is being issued.

When the permit application was first submitted, our regulations did not require a specific design approval. We have since issued new regulations that do require it (18 AAC 60.203). A design decisions will be provided at the time the permit decision is provided.

I was hoping to get the public notice issued today, but that is looking less and less likely, and I will be out of the office the rest of the week. I will let you know when it is issued and will be published in the Frontiersman.

Thanks,
Lori

Hi Lori,

Thank you again for meeting with us about the monofill in Mat- Su. I'm reading through CMS' application to the borough and they repeatedly state that DEC has APPROVED their monofill design. You said that was not the case. Can you send me the documentation proving that. Do you have a letter or email you sent them to that effect. I want to include it in my comments to the borough.

Thanks much!

However, since that appeared to be the larger hurdle, we chose to wait until they completed the CUP rather than research the information collected. Since CMS has submitted updated site conditions (survey) and we need to add the question of the asbestos cell, the new public notice is being issued.

When the permit application was first submitted, our regulations did not require a specific design approval. We have since issued new regulations that do require it (18 AAC 60.203). A design decisions will be provided at the time the permit decision is provided.

I was hoping to get the public notice issued today, but that is looking less and less likely, and I will be out of the office the rest of the week. I will let you know when it is issued and will be published in the Frontiersman.

Thanks,
Lori

Subject: DEC approval of CMS permit

Hi Lori,

Thank you again for meeting with us about the monofill in Mat- Su. I'm reading through CMS' application to the borough and they repeatedly state that DEC has APPROVED their monofill design.

You said that was not the case. Can you send me the documentation proving that. Do you have a letter or email you sent them to that effect. I want to include it in my comments to the borough.

Thanks much!

Subject: Comment: Central Monofill Services Conditional Use Permit

The Alaska Department of Environmental Conservation (ADEC) Solid Waste Program has been asked to submit official comment on the Central Monofill Services (CMS) Matanuska Susitna Borough (MSB) Conditional Use Permit (CUP) Application.

On page 17of 38 of the CMS MSB CUP application it states:
Alaska Department of Environmental Conservation (ADEC) reviewed the CMS Monofill Permit application for this site and has approved the permit conditioned upon receipt of the MSB CUP.

This issue was addressed in the application by CMS in response letter to you , dated May 12, 2014.

The ADEC Solid Waste Program has reviewed the CMS Inert Waste Monofill Permit application submitted January 12, 2013, including additional information submitted January 23, 2013. ADEC Solid Waste determined that the application was complete, and posted a public notice in the Frontiersman on March 12 & 15, 2013. No comment was received on the public notice.

Due to an error in the original public notice, which excluded the permitting of an Asbestos waste cell at the monofill, ADEC will be publishing an additional 30-day public notice in the near future.

At this time, NO DECISION has been issued by ADEC on the CMS Inert Waste Monofill Permit application other than it is complete based on our January 2013 regulations.

Thank you,
Lori

Subject: RE: URGENT: DEC correction on misstatements about approval of monofill design

Below is a copy of the email sent to CMS & MSB in March 2014. Please note that CMS responded appropriately in their application materials to this issue on March 12, 2014.

CMS MSB CUP Application

From Aldrich, Lori (DEC) **Date** March 7, 2014 at 7:51:00 PM EST

To Shane Durand ; Stuart Jacques

Cc

Bcc Susan Lee

Subject CMS MSB CUP Application

Shane and Stuart,

I was sent a copy of the Matanuska-Susitna Borough (MSB) Conditional Use Permit (CUP) Application. It included additional information that had not been previously submitted to ADEC. I did a brief review of the application. Although, this is not an official review of the application, I do have some comments regarding some of the language and information in the CUP application as it relates to the Inert Waste Monofill Permit Application submitted to ADEC.

CUP Application

Page 16 – These wells and monitoring plan are not required by ADEC but will allow CMS to monitor the groundwater for any concerns long term.

See comment below on Groundwater Monitoring Plan

Page 17 - Alaska Department of Environmental Conservation (ADEC) reviewed the CMS Monofill Permit application for this site and has approved the permit conditioned upon receipt of the MSB CUP.

ADEC has NOT APPROVED the permit – the permit application was deemed complete and a public notice was issued. ADEC also noted, in discussions with CMS, that if any significant changes were made to the permit application information in regard to the requirements of the Conditional Use Permit (CUP) issued by MSB a new complete ADEC monofill application would need to be submitted, including a new public comment period.

Page 28 - More than 70% of the existing monofill footprint is already in excess of 10' above the seasonal ground water table. Those areas with insufficient separation from ground water will be filled with onsite earthen materials to obtain a minimum separation of 10'.

The original permit application indicated that the low point of the monofill was more than 10 feet above the groundwater table. In discussions, CMS indicated that additional groundwater studies would be performed in May 2013 to determine the seasonal high groundwater levels, and the reports submitted to ADEC. The groundwater contours were developed from data collected on July 13, 2013, which would identify seasonal low groundwater levels. In addition, no discussion of fill to attain the proper groundwater separation was discussed. If areas are filled, you will need to resurvey the site and submit a new drawing of the present conditions.

Page 31 - The ADEC permit requires the owner to provide bonding or other financial assurance to cover the cost of monofill closure. The ADEC has a predetermined method for calculating the amount required for the bond or other financial assurance to make sure it is enough to cover all closure costs. CMS has met this obligation as part of the ADEC permit.

CMS has not presented adequate financial assurance to meet this requirement, and we would not expect CMS to submit this until ADEC had determined that a permit would be issued or denied. This will be based on a final review of the application and any other information gathered regarding the site conditions and facility plans.

Page 33 - ADEC has approved the proposed monofill design pending receipt of the MSB CUP.

ADEC has determined that the monofill design package is complete, but has not issued an approval for the design.

Maddox & Associates Report

Pg B-29 – states "the planned elevation of the bottom of the inert refuse in the monofill is a minimum of 10-feet below the normal seasonal high [water table].

Above, the CUP text indicates that this is not true, based on the ADEC monofill permit application, which does not include fill.

Groundwater Monitoring Plan

If CMS will be performing Groundwater monitoring at the site, a Groundwater Monitoring Plan that meets the conditions of 18 AAC 60.820-860 must be submitted to and approved by ADEC. This would be considered a significant change to the landfill operations.

RACM Cell

As I believe you were informed, the original Public Notice by ADEC did not include mention of the RACM cell. The only possible correction would be to issue an additional public notice if you will include a RACM cell at the monofill. I thought we had communicated to you and suggested that, if ADEC did permit the monofill, you might wait to begin a RACM cell at the site, and we could make the necessary permit modifications (including a public notice) at that time. In addition, we are somewhat concerned regarding comments on the wind issues at the site and our ability to permitRACM disposal.

If you have any questions or wish to discuss the comments, you can contact me after March 17. I will be out of the office in training all next week.

Thanks,

Lori

Subject: Re: URGENT: DEC correction on misstatements about approval of monofill design

Hi Lori,

I trust you are doing your best, and I appreciate your quick responses.

I do think it's relevant (and good government) that ADEC straighten out the record given that this matter is in front of a government body that will be deliberating using the official record. There are misstatements in that record that ADEC has approved the permit and no corresponding statement from ADEC to the contrary.

Sending a letter or email to the borough simply ensures that everyone is on the same page and has the correct information straight from ADEC and can refer to that if questions arise.

Thank you,

Stephanie Nowers

Actually, now that you mention it, I may have sent an email to Susan Lee. I was searching for one sent to CMS. Unfortunately I do not currently have access to my email archives. I will check when access is available. It may also be quoted in a frontiersman article if you check those.

It was reiterated several times to several sources, but as we did not do a formal review of the CUP application, and, it is irrelevant until we make a permit decision, it was not documented to the file.

Thank you,
Lori

Hi Lori,

I hate to be a bother. But ADEC, as a state agency, needs to be clear about its record and actions.

Central Monofill Services' repeatedly states in their application to the Mat-Su Borough that they have ADEC approval for their monofill design. From what you say in your email below, this is not true.

I think it is incumbent on ADEC to correct the record and send a formal statement to the Mat-Su Borough and CMS to make sure the record is clear for all involved. Saying you corrected CMS' misstatements verbally with no record of that communication is not a clear record.

I also believe it is incumbent on ADEC to send this formal statement to the Mat-Su Borough before the Oct. 31 deadline for comments so that it is part of the official record to the Mat-Su Borough Planning Commission and they are operating with correct and true information. This can be done simply by sending a letter to Mat-Su Borough Planner Susan Lee who is in charge of collecting comments at slee@matsugov.us

Below are cited some but perhaps not all of the references in CMS' application where they state they have ADEC approval. This can all be confirmed by looking at CMS' application which is online at the Mat-Su borough website.

Thanks Lori. And sorry again to be a bother since I know you are busy. I have copied Bob as your email indicated you might not be checking your email regularly this week and there is a public comment deadline looming.

907.229.1982

2nd page of CMS application intro Letter: "CMS submits this CUP application and attachments to address the requirements described in MSB 17.60 and other requests made by staff. The MSB does not have design standards or specific CUP standards for a recycle facility or monofill. The facility has been designed to meet the State of Alaska DEC standards for an inert waste monofill. ADEC has approved the proposed Monofill design."

Page 17: "Alaska Department of Environmental Conservation (ADEC) reviewed the CMS Monofill Permit application for this site and has approved the permit conditioned upon receipt of the MSB CUP."

Page 33: "Alaska Department of Environmental Conservation (ADEC) reviewed the CMS Monofill Permit application for this site and has approved the permit conditioned upon receipt of the MSB CUP."

Screenshot below from Page 282, the borough asks specifically about the ADEC permit and CMS responds maintaining they have approval and have met the requirements for the monofill.

The MSB does not have design standards or specific CUP standards for a recycle facility or monofill. The facility has been designed to meet the State of Alaska DEC standards for an inert waste monofill. ADEC has approved the proposed Monofill design."

Page 17: "Alaska Department of Environmental Conservation (ADEC) reviewed the CMS Monofill Permit application for this site and has approved the permit conditioned upon receipt of the MSB CUP."

Page 33: "Alaska Department of Environmental Conservation (ADEC) reviewed the CMS Monofill Permit application for this site and has approved the permit conditioned upon receipt of the MSB CUP."

Screenshot below from Page 282, the borough asks specifically about the ADEC permit and CMS responds maintaining they have approval and have met the requirements for the monofill.

As stated in your email of January 22, 2014 from Lori Aldrich, ADEC has reviewed the application and determined it met the requirements for an inert monofill, this led to them posting public notice. On April 15th 2013 we received the attached email from Nathaniel Emery with ADEC that stated, "I spoke with the Matsu Borough and looks like their process is much further out. Because you can't do much without their green light, we probably won't race to issue this permit but so far we feel the application is complete and nobody has presented any information for us to be suspicious of the proposal." Both emails agree that we have met the requirements of an inert monofill. ADEC could issue the permit but it would be conditioned upon having any locally required permits, in this case the MSB CUP. The ADEC permit has not been written, however we have confirmation from both of these ADEC staff that our application meets the requirements for an inert monofill and has been through the public comment period. See Attachment 10. The MSB CUP can be granted with it conditioned upon having the final ADEC permit.

Stephanie,

ADEC has never issued any approval of the design. At the time we first went to public notice, we agreed that the application and the design met the regulations, as presented. The purpose of the public notice was to identify any items that might have been at issue in our understanding of the conditions and potential impacts of the site. If no additional information had surfaced, and the retesting of the groundwater elevations had confirmed the distance to groundwater, we could have issued a permit for the facility without the asbestos cell, which would have been conditioned upon receiving the MSB Conditional Use Permit. However, since that appeared to be the larger hurdle, we chose to wait until they completed the CUP rather than research the information collected. Since CMS has submitted updated site conditions (survey) and we need to add the question of the asbestos cell, the new public notice is being issued.

When the permit application was first submitted, our regulations did not require a specific design approval. We have since issued new regulations that do require it (18 AAC 60.203). A design decisions will be provided at the time the permit decision is provided.

I was hoping to get the public notice issued today, but that is looking less and less likely, and I will be out of the office the rest of the week. I will let you know when it is issued and will be published in the Frontiersman.

Thanks,
Lori

Hi Lori,

Thank you again for meeting with us about the monofill in Mat- Su. I'm reading through CMS' application to the borough and they repeatedly state that DEC has APPROVED their monofill design. You said that was not the case. Can you send me the documentation proving that. Do you have a letter or email you sent them to that effect. I want to include it in my comments to the borough.

Thanks much!

Subject: URGENT: DEC correction on misstatements about approval of monofill design
Date: Tue, 28 Oct 2014 00:06:32 -0800

Hi Lori,

I hate to be a bother. But ADEC, as a state agency, needs to be clear about its record and actions.

Central Monofill Services' repeatedly states in their application to the Mat-Su Borough that they have ADEC approval for their monofill design. From what you say in your email below, this is not true.

I think it is incumbent on ADEC to correct the record and send a formal statement to the Mat-Su Borough and CMS to make sure the record is clear for all involved. Saying you corrected CMS' misstatements verbally with no record of that communication is not a clear record.

I also believe it is incumbent on ADEC to send this formal statement to the Mat-Su Borough before the Oct. 31 deadline for comments so that it is part of the official record to the Mat-Su Borough Planning Commission and they are operating with correct and true information. This can be done simply by sending a letter to Mat-Su Borough Planner Susan Lee who is in charge of collecting comments at slee@matsugov.us

Below are cited some but perhaps not all of the references in CMS' application where they state they have ADEC approval. This can all be confirmed by looking at CMS' application which is online at the Mat-Su borough website.

Thanks Lori. And sorry again to be a bother since I know you are busy. I have copied Bob as your email indicated you might not be checking your email regularly this week and there is a public comment deadline looming.

- Stephanie Nowers

Hi Lori,

I trust you are doing your best, and I appreciate your quick responses.

I do think it's relevant (and good government) that ADEC straighten out the record given that this matter is in front of a government body that will be deliberating using the official record. There are misstatements in that record that ADEC has approved the permit and no corresponding statement from ADEC to the contrary.

Sending a letter or email to the borough simply ensures that everyone is on the same page and has the correct information straight from ADEC and can refer to that if questions arise.

Thank you,

Stephanie Nowers

Actually, now that you mention it, I may have sent an email to Susan Lee. I was searching for one sent to CMS. Unfortunately I do not currently have access to my email archives. I will check when access is available. It may also be quoted in a frontiersman article if you check those.

It was reiterated several times to several sources, but as we did not do a formal review of the CUP application, and, it is irrelevant until we make a permit decision, it was not documented to the file.

Thank you,
Lori

Stephanie,
I am doing well, if you exclude trying to deal with email systems. I do apologize for the term irrelevant. My travel weary response was not well worded. I intended

I have managed to locate an email that I sent to CMS on March 7, 2014, and BCC'd to Susan Lee. I will go into work on Friday so I am able to forward the email, and will submit an official comment to the Borough to reiterate that ADEC has not made any decisions regarding the landfill permit, including issuing a design approval.

Subject: RE: URGENT: DEC correction on misstatements about approval of monofill design

Lori,

To quote your email of March 19, 2014.

"Page 17 - Alaska Department of Environmental Conservation (ADEC) reviewed the CMS Monofill Permit application for this site and has approved the permit conditioned upon receipt of the MSB CUP.

ADEC has NOT APPROVED the permit – the permit application was deemed complete and a public notice was issued. ADEC also noted, in discussions with CMS, that if any significant changes were made to the permit application information in regard to the requirements of the Conditional Use Permit (CUP) issued by MSB a new complete ADEC monofill application would need to be submitted, including a new public comment period."

Per your email and questions raised by MSB staff of the original January 2014 application this was clarified in the May supplemental package to the MSB.

Stephanie,

First, let me apologize for the term "irrelevant", I should not be answering emails when I am travel weary. My intent was to that communicate that the MSB CUP is not material to our permitting process, other than the fact that the monofill could not operate without both permits.

Back to the question at hand, I have located the comment email that I sent to CMS, which was also BCC'd to Susan Lee on March 7, 2014. I will come into the office on Friday to send you a copy, as I have not been able

to properly recover the archive using my available electronics. I will also make sure it is submitted as record to MSB, and I will reiterate that we have not issued any approvals for the permit or the submitted design. Any decisions will be documented at the time we issue our permit decision.

Thanks,
Lori

Actually, now that you mention it, I may have sent an email to Susan Lee. I was searching for one sent to CMS. Unfortunately I do not currently have access to my email archives. I will check when access is available. It may also be quoted in a frontiersman article if you check those.

It was reiterated several times to several sources, but as we did not do a formal review of the CUP application, and, it is irrelevant until we make a permit decision, it was not documented to the file.

Thank you,
Lori

I also believe it is incumbent on ADEC to send this formal statement to the Mat-Su Borough before the Oct. 31 deadline for comments so that it is part of the official record to the Mat-Su Borough Planning Commission and they are operating with correct and true information. This can be done simply by sending a letter to Mat-Su Borough Planner Susan Lee who is in charge of collecting comments at slee@matsugov.us

Below are cited some but perhaps not all of the references in CMS' application where they state they have ADEC approval. This can all be confirmed by looking at CMS' application which is online at the Mat-Su borough website.

Thanks Lori. And sorry again to be a bother since I know you are busy. I have copied Bob as your email indicated you might not be checking your email regularly this week and there is a public comment deadline looming.

To: Shane Durand; Stuart Jacques
Subject: CMS MSB CUP Application

Shane and Stuart,

I was sent a copy of the Matanuska-Susitna Borough (MSB) Conditional Use Permit (CUP) Application. It included additional information that had not been previously submitted to ADEC. I did a brief review of the application. Although, this is not an official review of the application, I do have some comments regarding some of the language and information in the CUP application as it relates to the Inert Waste Monofill Permit Application submitted to ADEC.

CUP Application

Page 16 – These wells and monitoring plan are not required by ADEC but will allow CMS to monitor the groundwater for any concerns long term.

See comment below on Groundwater Monitoring Plan

Page 17 - Alaska Department of Environmental Conservation (ADEC) reviewed the CMS Monofill Permit application for this site and has approved the permit conditioned upon receipt of the MSB CUP.

ADEC has NOT APPROVED the permit – the permit application was deemed complete and a public notice was issued. ADEC also noted, in discussions with CMS, that if any significant changes were made to the permit application information in regard to the requirements of the Conditional Use Permit (CUP) issued by MSB a new complete ADEC monofill application would need to be submitted, including a new public comment period.

Page 28 - More than 70% of the existing monofill footprint is already in excess of 10' above the seasonal ground water table. Those areas with insufficient separation from ground water will be filled with onsite earthen materials to obtain a minimum separation of 10'.

The original permit application indicated that the low point of the monofill was more than 10 feet above the groundwater table. In discussions, CMS indicated that additional groundwater studies would be performed in May 2013 to determine the seasonal high groundwater levels, and the reports submitted to ADEC. The groundwater contours were developed from data collected on July 13, 2013, which would identify seasonal low groundwater levels. In addition, no discussion of fill to attain the proper groundwater separation was discussed. If areas are filled, you will need to resurvey the site and submit a new drawing of the present conditions.

Page 31 - The ADEC permit requires the owner to provide bonding or other financial assurance to cover the cost of monofill closure. The ADEC has a predetermined method for calculating the amount required for the bond or other financial assurance to make sure it is enough to cover all closure costs. CMS has met this obligation as part of the ADEC permit.

CMS has not presented adequate financial assurance to meet this requirement, and we would not expect CMS to submit this until ADEC had determined that a permit would be issued or denied. This will be based on a final review of the application and any other information gathered regarding the site conditions and facility plans.

Page 33 - ADEC has approved the proposed monofill design pending receipt of the MSB CUP.

ADEC has determined that the monofill design package is complete, but has not issued an approval for the design.

Maddox & Associates Report

Pg B-29 – states "the planned elevation of the bottom of the inert refuse in the monofill is a minimum of 10-feet below the normal seasonal high [water table].

Above, the CUP text indicates that this is not true, based on the ADEC monofill permit application, which does not include fill.

Groundwater Monitoring Plan

If CMS will be performing Groundwater monitoring at the site, a Groundwater Monitoring Plan that meets the conditions of 18 AAC 60.820-860 must be submitted to and approved by ADEC. This would be considered a significant change to the landfill operations.

RACM Cell

As I believe you were informed, the original Public Notice by ADEC did not include mention of the RACM cell. The only possible correction would be to issue an additional public notice if you will include a RACM cell at the monofill. I thought we had communicated to you and suggested that, if ADEC did permit the monofill, you might wait to begin a RACM cell at the site, and we could make the necessary permit modifications (including a public notice) at that time. In addition, we are somewhat concerned regarding comments on the wind issues at the site and our ability to permit RACM disposal.

If you have any questions or wish to discuss the comments, you can contact me after March 17. I will be out of the office in training all next week.

Thanks,
Lori

Susan,
Straight form the regulations:

18 AAC 60.265. Proof of financial responsibility. Unless the applicant has provided equivalent surety through a government agency or has demonstrated financial assurance under 18 AAC 60.398, the department will require proof of financial responsibility to cover the cost of closing a landfill and, if monitoring is required, the cost of post-closure monitoring if the department determines proof of financial responsibility is necessary to protect the public health, safety, or welfare, or the environment. Proof of financial responsibility under this section may be demonstrated by self-insurance, insurance, surety, or other guarantee approved by the department to assure compliance with applicable closure standards and post-closure monitoring requirements. (Eff. 1/28/96, Register 137; am 10/29/98, Register 148)

Most Companies use insurance, bonding, or a letter of credit.

Susan,

Whether they must submit a new application remains to be seen, and will be determined by ADEC. They are required to submit their more comprehensive hydrological study and any potential changes as they relate to that. In addition, I presume they have made some concessions to the Borough to resubmit for the conditional use permit.

Thanks for keeping me posted.

Subject: RE: Central Monofill Services

Susan,

We do not have a draft permit, as the application has been on hold. We had reviewed the application and determined that it met the requirements for an inert waste monofill, and had posted a public notice. However, if they make even minor changes to the plan, the must submit a new application, including posting another public notice. At this point, the permit would likely

include any stipulations required by the conditional use permit as well as others initiated by ADEC.

Attached is the permit for the Alaska Demolition Palmer Inert Waste Monofill.

Please call or email if you have any additional questions.

Thanks,
Lori

Hi Lori:

I am processing the conditional use permit for Central Monofill Services proposed monofill outside of Palmer. I know the ADEC permit was not issued since the MSB permit was not approved. However, I was wondering if there is a draft permit that I could review. CMS's application material states that " ADEC reviewed the CMS Monofill Permit application for this site and has approved the permit conditioned upon receipt of the MSB CUP".

In addition, could you send me a copy of the Alaska Demolition permit for their operation in Palmer.

If you have any questions or need additional information please let me know.

Susan

RE: Solid Waste Disposal Permit, Palmer Reclamation Site – Inert Waste Monofill
Permit No. SWZA004-14

Dear Mr. Green:

The Alaska Department of Environmental Conservation (ADEC) has completed its evaluation of your permit application for the Palmer Reclamation Site Inert Waste Monofill. This permit is being issued in accordance with Alaska Statute (AS) 46.03; Title 18, Chapter 15 of the Alaska Administrative Code (18 AAC 15); and the Solid Waste Regulations (18 AAC 60). Please review the conditions and stipulations in the permit and ensure that people who conduct waste disposal operations understand them.

Any person who disagrees with this decision may request an adjudicatory hearing in accordance with 18 AAC 15.195 - 18 AAC 15.340 or an informal review by the Division Director in accordance with 18 AAC 15.185. **Informal review requests** must be delivered to the Division Director, Alaska Department of Environmental Conservation, 555 Cordova Street, Anchorage, AK 99501 within 15 days of the permit decision. **Adjudicatory hearing requests** must be delivered to the Commissioner of the Department of Environmental Conservation, 410 Willoughby Avenue, Suite 303, Juneau, Alaska 99801, within 30 days of the permit decision. If a hearing is not requested within 30 days, the right to appeal is waived. Even if an adjudicatory hearing has been requested and granted, all permit conditions remain in effect unless a stay has been granted.

If you have any questions, or require any additional information, please contact me at (907) 269-7622 or by email at *Lori.Aldrich@Alaska.gov*.

Sincerely,

Lori Aldrich
Solid Waste Program Coordinator

Attachment: **Permit # SWZA004-14 expiring on April 1, 2014**

STATE OF ALASKA
DEPARTMENT OF ENVIRONMENTAL CONSERVATION
555 Cordova Street
Anchorage, AK 99501

SOLID WASTE DISPOSAL PERMIT

Permit No. **SWZA004-14**

Date Issued: April 23, 2009
Date Expires: April 1, 2014

The Alaska Department of Environmental Conservation (ADEC), under authority of AS 46.03 and 18 AAC 60, issues a solid waste disposal permit to:

Alaska Demolition, LLC
2903 Tanglewood
Anchorage, AK 99501

Palmer Reclamation Site – Inert Waste Monofill

and designated representatives for the management and operation of an inert solid waste landfill. It authorizes the disposal of construction and demolition debris and other inert waste.

The landfill is located within the North ½ of the Southeast ¼, Section 8, Township 17 North, Range 2 East, Seward Meridian.

The permit holder shall manage and operate the facility in accordance with 18 AAC 60 and the incorporated permit application materials:

1. Permit application dated April 1, 2009
2. Operations Plan dated March 30, 2004, and addendum dated, December 29, 2005.

Waivers

Alaska Demolition, LLC has requested a waiver for the requirement for design documents to be stamped and sealed by a registered engineer. The monofill is constructed in an existing gravel pit with limited additional design features. ADEC approves the waiver with the condition that the site is surveyed annually and the site plan updated to reflect the survey information.

Specific Conditions

1. Erect and maintain signs at the facility entrance which clearly identify
   - Landfill owner/operator
   - Hours of operation
   - Emergency contacts
   - Prohibited waste, including, but not limited to liquid waste, food waste, oily waste, hazardous waste, and polychlorinated biphenyls.

2. Maintain a minimum separation distance of 50 feet between the active placement of solid waste and the facility boundary.

3. Maintain a separation distance of 500 feet between active placement of solid waste and any drinking water well.

4. Prohibit the disposal of regulated asbestos containing material as defined under 18 AAC 60.990(108).

5. Handle non-RACM waste to prevent the release of asbestos fibers to the air or to surface water
   - Place non-RACM waste directly at the working face of the landfill
   - Do not compact uncovered non-RACM waste
   - Cover non-RACM waste within 24 hours after placement.

6. Update financial assurance documentation annually, no later than April 1.

General Conditions

1. Access and inspection - The Permittee shall allow the Commissioner or his representative access to the permitted facilities at reasonable times to conduct scheduled or unscheduled inspections or tests to determine compliance with this permit, State laws, and regulations.

2. Information access - Except for information relating to confidential processes or methods of manufacture, all records and reports submitted in accordance with the terms of this permit shall be available for public inspection at the State of Alaska, Department of Environmental Conservation, 555 Cordova Street, Anchorage, AK 99501.

3. Civil and criminal liability - Nothing in this permit shall relieve the Permittee from civil or criminal penalties for noncompliance, whether or not such noncompliance is due to factors beyond his control, including, but not limited to, accidents, equipment breakdowns, or labor disputes.

4. Availability - The Permittee shall post or maintain a copy of this permit available to the public at the disposal facility.

5. Adverse impact - The Permittee shall take all necessary means to minimize any adverse impacts to the receiving waters or lands resulting from noncompliance with any limitation specified in this permit, including any additional monitoring needed to determine the nature and impact of the noncomplying activity. The Permittee shall clean up and restore all areas adversely impacted by the noncompliance.

6. Cultural or paleontological resources - Should cultural or paleontological resources be discovered as a result of this activity, work which would disturb such resources is to be stopped, and the State Historic Preservation Office, Division of Parks and Outdoor Recreation, Department of Natural Resources, is to be notified immediately (907-269-8721).

7. Applications for renewal - In accordance with 18 AAC 15.100(d), applications for renewal or amendment of this permit must be made no later than 30 days before the expiration date of the permit, or the planned effective date of the amendment.

8. Other legal obligations - The requirements, duties, and obligations set forth in this permit are in addition to any requirements, duties, or obligations contained in any permit that the Alaska Department of Environmental Conservation or the U.S. Environmental Protection Agency has issued or may issue to the Permittee. This permit does not relieve the Permittee from the duty to obtain any and all necessary permits and to comply with the requirements contained in any such permit or with applicable state and federal laws and regulations. All activities conducted by the Permittee pursuant to the terms of this permit and all plans implemented by the Permittee pursuant to the terms of this permit shall comply with all applicable state and federal laws and regulations.

9. Pollution prevention - In order to prevent and minimize present and future pollution, when making management decisions that affect waste generation, the Permittee shall consider the following order of priority options: waste source reduction; recycling of waste; waste treatment; and waste disposal.

This permit expires on **April 1, 2014**, and may be revoked or amended in accordance with 18 AAC 60.260. The permit can be renewed if the facility will operate beyond this date. To avoid expiration of this permit, a renewal application must be submitted to ADEC at least 30 days before the expiration date, as set forth in 18 AAC 15.110.

No Exposure Certification for Exclusion from APDES Storm Water Permitting

Submission of this No Exposure Certification constitutes notice that the entity identified in Section I does not require permit authorization for its storm water discharges associated with industrial activity in Alaska identified in Section II under ADEC's Storm Water Multi-Sector General Permit (MSGP) due to the existence of a condition of no exposure.

A condition of no exposure exists at an industrial facility when all industrial materials and activities are protected by a storm resistant shelter to prevent exposure to rain, snow, snowmelt, and/or runoff. Industrial materials or activities include, but are not limited to, material handling equipment or activities, industrial machinery, raw materials, intermediate products, by-products, final products, or waste products. Material handling activities include the storage, loading and unloading, transportation, or conveyance of any raw material, intermediate product, final product, or waste product. A storm resistant shelter is not required for the following industrial materials and activities:

- drums, barrels, tanks, and similar containers that are tightly sealed, provided those containers are not deteriorated and do not leak. "Sealed" means banded or otherwise secured and without operational taps or valves;
- adequately maintained vehicles used in material handling; and
- final products, other than products that would be mobilized in storm water discharges (e.g., rock salt).

A No Exposure Certification must be provided for each facility qualifying for the no exposure exclusion. In addition, the exclusion from APDES permitting is available on a facility-wide basis only, not for individual outfalls. If any industrial activities or materials are or will be exposed to precipitation, the facility is not eligible for the no exposure exclusion.

By signing and submitting this No Exposure Certification form, the entity in Section I is certifying that a condition of no exposure exists at its facility or site, and is obligated to comply with the terms and conditions of 40 CFR 122.26(g), adopted by reference at 18 AAC 83.010(b)(3).

ALL INFORMATION MUST BE PROVIDED ON THIS FORM.

Detailed instructions for completing this form and obtaining the no exposure exclusion are provided on page 3.

Section I. Facility Operator Information

Name: Central Recycling Services

Mailing Address:

Street (PO Box): 2400 Railroad Ave.

City: Anchorage State: Alaska Zip: 99501

Phone: 907-748-7400 Fax(optional):

Email: crs@crs-alaska.com

Section II. Facility/Site Location Information

Facility Name: Central Monofill Services

Street Address: 2480 and 2560 S. Glenn Highway

City: Palmer State: Alaska Zip: 99645

Borough or similar government subdivision: Matanuska-Susitna Borough

Is this facility located on Indian Lands? ☐ Yes ☑ No

Is this a Federal facility? ☐ Yes ☑ No

Latitude: 61.540833 Longitude: 149.169444

Determined By: ☐ GPS ☐ USGS topographic map ■ Other: Google Earth

Was the facility or site previously covered under an NPDES or APDES storm water permit? ☐ Yes ☑ No

If yes, enter the NPDES or APDES permit number or tracking number?

SIC/Activity Codes: Primary: 561210 Secondary (if applicable):

Total size of site associated with industrial activity (in acres): 40 acres

Have you paved or roofed over a formerly exposed, pervious area in order to qualify for the no exposure exclusion? ☐ Yes ☑ No

If yes, please indicate approximately how much area was paved or roofed over. Completing this question does not disqualify you for the no exposure exclusion. However, your permitting authority may use this information in considering whether storm water discharges from your site are likely to have an adverse impact on water quality, in which case you could be required to obtain permit coverage.

Less than one acre ☐ One to five acres ☐ More than five acres ☐

For Agency Use

Permit Tracking #_____

Section III. Exposure Checklist

Are any of the following materials or activities exposed to precipitation, now or in the foreseeable future? (Please check either "Yes" of "No" in the appropriate box.) **If you answer "Yes" to any of these questions, (1) through (11), you are not eligible for the no exposure exclusion.**

	Yes	No
1. Using, storing, or cleaning industrial machinery or equipment, and areas where residuals from using, storing, or cleaning industrial machinery or equipment remain and are exposed to storm water.	☐	☑
2. Materials or residuals on the ground or in storm water inlets from spills/leaks.	☐	☑
3. Materials or products from past industrial activity.	☐	☑
4. Material handling equipment (except adequately maintained vehicles).	☐	☑
5. Materials or products during loading/unloading or transporting activities.	☐	☑
6. Materials or products stored outdoors (except final products intended for outside use [e.g., new cars] where exposure to storm water does not result in the discharge of pollutants).	☐	☑
7. Materials contained in open, deteriorated, or leaking storage drums, barrels, tanks, and similar containers.	☐	☑
8. Materials or products handled/stored on roads or railways owned or maintained by the discharger.	☐	☑
9. Waste material (except waste in covered, non-leaking containers [e.g., dumpsters]).	☐	☑
10. Application or disposal of process wastewater (unless otherwise permitted).	☐	☑
11. Particulate matter or visible deposits of residuals from roof stacks and/or vents not otherwise regulated (i.e., under an air quality control permit) and evident in the storm water outflow.	☐	☑

Section IV. Certification Statement

I certify under penalty of law that I have read and understand the eligibility requirements for claiming a condition of "no exposure" and obtaining an exclusion from APDES storm water permitting under ADEC's Multi-Sector General Permit.

I certify under penalty of law that there are no discharges of storm water contaminated by exposure to industrial activities or materials from the industrial facility or site identified in this document (except as allowed under 40 CFR 122.26(g)(2)).

I understand that I am obligated to submit a no exposure certification form once every five years to the APDES permitting authority and, if requested, to the operator of the local municipal separate storm sewer system (MS4) into which the facility discharges (where applicable). I understand that I must allow the APDES permitting authority, or MS4 operator where the discharge is into the local MS4, to perform inspections to confirm the condition of no exposure and to make such inspection reports publicly available upon request. I understand that I must obtain coverage under an APDES permit prior to any point source discharge of storm water from the facility.

Additionally, I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is to the best of my knowledge and belief true, accurate and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

Print Name of Authorized Official: Shane Durand Title: Secretary/Treasurer

Signature: Date Signed: 6-3-13 Email: shane@cei-alaska.com

Instructions for the No Exposure Certification for Exclusion from APDES Storm Water Permitting

Who May File a No Exposure Certification

Federal law at 40 CFR Part 122.26, adopted by reference at 18 AAC 83.010(b)(3), prohibits point source discharges of storm water associated with industrial activity to waters of the U.S. without an Alaska Pollutant Discharge Elimination System (APDES) permit. However, APDES permit coverage is not required for discharges of storm water associated with industrial activities identified at 40 CFR 122.26(b)(14)(i)-(ix) and (xi) if the discharger can certify that a condition of "no exposure" exists at the industrial facility or site.

Storm water discharges from construction activities identified in 40 CFR 122.26(b)(14)(x) and (b)(15) are not eligible for the no exposure exclusion.

Obtaining and Maintaining the No Exposure Exclusion

This form is used to certify that a condition of no exposure exists at the industrial facility or site described herein. This certification is only applicable in jurisdictions where ADEC is the NPDES permitting authority and must be re-submitted at least once every five years.

The industrial facility operator must maintain a condition of no exposure at its facility or site in order for the no exposure exclusion to remain applicable. If conditions change resulting in the exposure of materials and activities to storm water, the facility operator must obtain coverage under an APDES storm water permit immediately.

Completing the Form

You must type or print in appropriate areas only. One form must be completed for each facility or site for which you are seeking to certify a condition of no exposure. Additional guidance on completing this form can be accessed at ADEC's Storm water Program website: http://www.dec.state.ak.us/water/wnpspc/stormwater/stormwater.htm .

Please make sure you have addressed all applicable questions and have made a photocopy for your records before sending the completed form to the above address.

Section I. Facility Operator Information

- Provide the legal name of the person, firm, public organization, or any other entity that operates the facility or site described in this certification. The name of the operator may or may not be the same as the name of the facility. The operator is the legal entity that controls the facility's operation, rather than the plant or site manager.
- Provide the telephone number of the facility operator.
- Provide the email address of the facility operator.
- Provide the mailing address of the operator (P.O. Box numbers may be used). Include the city, state, and zip code. All correspondence will be sent to this address.

Section II. Facility/Site Location Information

- Enter the official or legal name of the facility or site.
- Enter the complete street address (if no street address exists, provide a geographic description [e.g., Intersection of Routes 9 and 55]), city, state, zip code, and borough or similar government subdivision. Do not use a P.O. Box number.
- Indicate whether the facility is located on Indian Lands.
- Indicate whether the industrial facility is operated by a department or agency of the Federal Government (see also Section 313 of the Clean Water Act).
- Enter the latitude and longitude of the approximate center of the facility or site. The latitude and longitude of your facility can be determined in several different ways, including through the use of global positioning system (GPS) receivers, U.S. Geological Survey (U.S.G.S.) topographic or quadrangle maps, and EPA's web-based siting tools, among others.
- Indicate whether the facility was previously covered under an NPDES or APDES storm water permit. If so, include the permit number or permit tracking number.
- List the four-digit Standard Industrial Classification (SIC) code and/or two character activity code that best describes the primary industrial activities performed by your facility. Your primary industrial activity includes any activities performed on-site which are:
  (1) identified by the facility's one SIC code for which the facility is primarily engaged; and
  (2) included in the narrative descriptions of 40 CFR 122.26(b)(14)(i), (iv), (v), or (vii), and (ix). See Appendix D of the MSGP for a complete list of SIC codes and activities codes.
- Enter the total size of the site associated with industrial activity in acres. Acreage may be determined by dividing square footage by 43,560.
- Check "Yes" or "No" as appropriate to indicate whether you have paved or roofed over a formerly exposed, pervious area (e.g., lawn, meadow, dirt or gravel road/parking lot) in order to qualify for no exposure. If yes, also indicate approximately how much area was paved or roofed over and is now impervious area.

Section III. Exposure Checklist

Check "Yes" or "No" as appropriate to describe the exposure condition at your facility. If you answer "Yes" to **ANY** of the questions, (1) through (11), in this section, a potential for exposure exists at your site and you cannot certify to a condition of no exposure. You must obtain (or already have) coverage under an APDES storm water permit. After obtaining permit coverage, you can institute modifications to eliminate the potential for a discharge of storm water exposed to industrial activity and then certify to a condition of no exposure.

Section IV. Certification Information
The Certification of No Exposure, must be signed as follows:

(1) For a corporation, a responsible corporate officer shall sign the Certification, a responsible corporate officer means:

(A) a president, secretary, treasurer, or vice-president of the corporation in charge of a principal business function, or any other person who performs similar policy- or decision-making functions for the corporation; or

(B) the manager of one or more manufacturing, production, or operating facilities, if

(i) the manager is authorized to make management decisions that govern the operation of the regulated facility, including having the explicit or implicit duty of making major capital investment recommendations, and initiating and directing other comprehensive measures to assure long term environmental compliance with environmental statutes and regulations;

(ii) the manager can ensure that the necessary systems are established or actions taken to gather complete and accurate information for permit application requirements; and

(iii) authority to sign documents has been assigned or delegated to the manager in accordance with corporate procedures.

(2) For a partnership or sole proprietorship, the general partner or the proprietor, respectively; or

(3) for a municipality, state, or other public agency, either a principal executive officer or ranking elected official shall sign the application; in this subsection, a principal executive officer of an agency means

(A) the chief executive officer of the agency; or

(B) a senior executive officer having responsibility for the overall operations of a principal geographic unit or division of the agency.

Include the name, title, and email address of the person signing the form and the date of signing. An unsigned or undated Certification form will not be considered valid exclusion from permit coverage.

Where to File Certification form
Please submit the Certification to ADEC as follows:

If you file by mail, please submit the original form with a signature in ink. ADEC will not accept a photocopied signature. Remember to retain a copy for your records.

Shane,

Based on the fact that there is no discharge to a water of the US, the facility does not need permit coverage under the Multi-Sector General Permit. Therefore no No Exposure Certificate needs to be submitted to DEC.

Thank you for your prompt reply.

1. Inert Construction and Demolition Debris and soils.
2. Waste handled at the facility will be per a DEC Solid Waste Inert Monofill Permit. See Answer to #3 as well. Per the permit mono-filled waste is routinely covered with soil to reduce any infiltration. The working face where waste is placed for compaction and covering is built such that storm water will not run into the working face. Lori Aldrich in Solid Waste at ADEC can answer questions particular to our permit application. Monofills etc.
3. Attached is a copy of the drainage plan for the site. There are no "water of the US" on this site. All storm water stays on site and newly constructed surfaces will be graded to drain runoff away from waste as designed. Even the driveway slopes back into the site so there is no way for runoff to leave site or enter waters of US.

We have hundreds of pages of modeling, consultants reports and design information on the water infiltration, precipitation, soil types, waste etc. if you have further questions let me know. All of the supplemental information is fairly large and would need to be burned to a disc. If it helps I could stop by and go through any of this information as well.

Subject: No Exposure Certificate for Multi-Sector General Permit

Shane,

I reviewed the No-Exposure Certificate for your facility "Central Monofill Services" and have some follow-up questions.

1. Please describe the type of waste being handled and disposed of at the facility.
2. Please describe how this waste avoids exposure to precipitation.
3. Please describe the flow path of the storm water discharge from the facility. Does the discharge enter a water of the US?

Please provide me answers to these questions by Sept 9, 2014 or sooner.

Thank you for your attention to this matter.

Subject: RE: No Exposure Certificate for Multi-Sector General Permit

Shane,

Based on the fact that there is no discharge to a water of the US, the facility does not need permit coverage under the Multi-Sector General Permit. Therefore no No Exposure Certificate needs to be submitted to DEC.

Thank you for your prompt reply.

1. Inert Construction and Demolition Debris and soils.
2. Waste handled at the facility will be per a DEC Solid Waste Inert Monofill Permit. See Answer to #3 as well. Per the permit mono-filled waste is routinely covered with soil to reduce any infiltration. The working face where waste is placed for compaction and covering is built such that storm water will not run into the working face. Lori Aldrich in Solid Waste at ADEC can answer questions particular to our permit application. Monofills etc.
3. Attached is a copy of the drainage plan for the site. There are no "water of the US" on this site. All storm water stays on site and newly constructed surfaces will be graded to drain runoff away from waste as designed. Even the driveway slopes back into the site so there is no way for runoff to leave site or enter waters of US.

We have hundreds of pages of modeling, consultants reports and design information on the water infiltration, precipitation, soil types, waste etc. if you have further questions let me know. All of the supplemental information is fairly large and would need to be burned to a disc. If it helps I could stop by and go through any of this information as well.

Shane,

I reviewed the No-Exposure Certificate for your facility "Central Monofill Services" and have some follow-up questions.

1. Please describe the type of waste being handled and disposed of at the facility.
2. Please describe how this waste avoids exposure to precipitation.
3. Please describe the flow path of the storm water discharge from the facility. Does the discharge enter a water of the US?

Please provide me answers to these questions by Sept 9, 2014 or sooner.

Subject: RE: Central Monofill Services
Attachments: C.P.P. Dam Letter 9-26-13.pdf

Susan,
Thanks for the contact. I too had contact with Zennon today.

Here is a copy of the letter sent to Central Recycling Services on Sept 26, 2013. It gave the company until May 30 to have an engineered plan in to our office, and until August to stop the diversion.
There is an option for applying to DNR for a permit to divert the water, but since there are continuing complaints and legislative inquiries, at this point without significant additional information being presented, I doubt that I would issue a permit. The Alaska Hydrologic Survey (Melissa Hill and her staff) have been conducting some field investigation in the area. We would be happy to brief you on that process.

I would appreciate getting a copy of the entire "new" application package. We look forward to a review of those materials, including the "groundwater study" that they "had conducted".
We would also be interested in your request for additional information as well.

Please feel free to give me a call or e-mail at any time. I am the primary contact for this project.

Sincerely,
Dave

To: Schade, David W (DNR); Hill, Melissa E (DNR)
Subject: Central Monofill Services

Hi David & Melissa:

I am processing the conditional use permit for Central Monofill Services proposed monofill outside of Palmer. This morning I received a call from a member of the public, Zennon McNeill, regarding their project. I am looking for some clarification and/or additional information regarding the information that he relayed to me. He stated that DNR has given CMS a deadline of May 31, 2014 to stop the flow of water from the middle lake. He stated that DNR told CMS that they could apply for a permit (he did not say what type of permit), but that DNR would deny the permit. He also stated that DNR is conducting a hydrological study of the area and was monitoring the wells and lake levels in the area. He stated that the water table will be raised when the water flow is stopped.

Do you need a copy of the application material we have received from CMS for this project? Their application material contains a groundwater study that they had conducted for this project. We are waiting for additional information from them in order to process the application. I would appreciate it if you would let me know what their status is with DNR.

Thank you for your assistance.

Attention: Mr. Stuart M. Jacques

RE: C. P. P. Dam (AK00401)

Dear Mr. Jacques:

As you are aware, the ADNR MLW/Water Resources section has been involved with ongoing issues related to the C.P.P Dam (Dam). This letter is a follow up to the meetings and discussions that our staff have had with Central Recycling Services staff concerning the Dam and diversion of water. In 2012, the Water Resources Section of the Alaska Department of Natural Resources (ADNR) approved an application from Granite Construction Company (Granite) for a *Certificate of Approval to Modify a Dam* for an artificial barrier to the flow of water between two gravel pits in Palmer, Alaska. Previously, this structure was determined to be under the jurisdiction of the Alaska dam safety regulations contained in Article 3 of 11 AAC 93. The barrier was named the C.P.P. Dam and assigned the National Inventory of Dams identification number AK00401. As indicated in the application, ADNR understood the purpose of the modification was to reduce the height of the "dam embankment" so that the Dam would no longer be within the definition of a state jurisdictional dam described in Alaska Statute (AS) 46.17.900 (3), while at the same time, maintaining the normal water level of the "Middle Pond." Based on historical observations, the normal water level of the Middle Pond was observed to be several feet higher than the adjacent pond to the west, referred to herein as the "West Pond."

The modification to said Dam was completed by Granite Construction Company in late 2012, and ADNR thereafter determined the modified structure no longer was a "jurisdictional" dam. In the spring of 2013, after the Middle Pond level recovered from the dam modification activities, a significant amount of flow was observed through the pore space in the rip rap lined spillway, and the Middle Pond water level appeared to be in the process of stabilizing at a level below the normal water level indicated in the approved design. ADNR, staff has estimated this flow rate through the pore space in the rip rap lined spillway on the order of 1000 gallons per minute (gpm), which is equivalent to 1.44 million gallons per day. As a result of this development, in July of 2013, your company installed a concrete barrier to the flow within the rip rap. Although this work appears to have reduced this flow to some degree, a significant amount of flow through the rip rap in the spillway downstream of the barrier continues to be easily observed.

An application for water right or application for temporary use of water was not submitted to ADNR during the application process for the *Certificate of Approval to Modify a Dam*. The Alaska Water Use Act (AS

46.15) requires a water right application or temporary water use application for the diversion of more than 500 gallons per day for more than ten days per calendar year. This equates to approximately 0.35 gpm. Installation of the barrier makes calculating an estimated flow more complex, but by observation, ADNR believes that the current diversion flow rate substantially exceeds 0.35 gpm. Consequently, ADNR requests that you improve the performance of the barrier to flow to reach a rate below the rate that requires an application, or apply for authorization to operate a diversion structure in accordance with Alaska Administrative Code Section 11 AAC 93.035. Because it is late in the construction season, ADNR requests that you apply for a permit to divert water or provide DNR with an engineered plan to stop the water diversion by May 30, 2014. This plan must include a timeline to accomplish the reduction in flow across the "dam" no later than August 31, 2014.

Further, please note that AS 46.15, and the 11 AAC 93.035 application requirements thereunder, also apply to any water use or diversion that may adversely affect the public interest. In the past and again in 2013, ADNR has received numerous complaints about high water levels in the nearby Canoe and Irene Lakes. Starting in 2006, ADNR began collecting water level data at those and other lakes in the area, including, with permission, the Middle and West Ponds at the gravel pits. ADNR now requests your permission to continue this monitoring until a technically sound understanding of the regional hydrogeology is developed. If you are willing to grant access, ADNR would like to install a temporary bench mark at a mutually convenient location and conduct monthly water level monitoring on your facility, as described in the attached permission request. Please sign and return this form if you are willing to grant this permission.

I want to thank you for your continued cooperation with ADNR as we seek to resolve this situation. If you would like to discuss this matter I can be reached at (907) 269-8645 or by cell (907) 230-6061. Further, please contact Melissa Hill, PhD, CPG at (907) 269-8646 in order to discuss establishing a benchmark and monitoring activities.

Sincerely,

M. Walker NRM II

for David W. Schade, MPA

Section Chief

Temporary Access and Monitoring Request

Introduction

The Department of Natural Resources is developing regional scale groundwater monitoring programs in the Mat-Su Valley, Anchorage Bowl, and Kenai Peninsula. The purpose for these programs is to gain a better understanding of available groundwater resources in these areas.

Why am I being contacted?

Success of the monitoring programs is highly dependent on the cooperation of businesses and homeowners granting staff from the Department of Natural Resources, Alaska Hydrologic Survey Unit temporary access to their property and well(s).

What do these programs involve?

The Alaska Hydrologic Survey is comprised of trained professional hydrologists. These professionals will measure lake level changes and well water depths on your property on a monthly basis. Alaska Hydrologic Survey staff will notify the property owner 24 to 48 hours before each site visit, which will take approximately 1 to 2 hours. The property owner is not required to be present for the site visit, which will occur on weekdays, during normal business hours 8:00 am to 5:00 pm. All data collected will be provided to the property owner free of charge.

What do I need to do to participate?

Participation in the program is voluntary and may be terminated at any time at the sole discretion of the participant.

Should you choose to participate in these important programs, the Department of Natural Resources, Alaska Hydrologic Survey Unit requests that you complete, sign and date the attached temporary access and monitoring agreement and return it, along with a copy of your well log[1] (should you have one available) to:

Alaska Hydrologic Survey
Attn: Dr. Hill
550 W. 7th Ave, Suite 1020
Anchorage, Alaska 99501

The Department of Natural Resources, Alaska Hydrologic Survey Unit thanks you for your cooperation and greatly appreciates your participation in these important projects.

[1]Well logs are requested as they will provide useful information for distinguishing water levels in different aquifer(s).

Temporary Access and Monitoring Agreement

This temporary access and monitoring agreement grants Department of Natural Resources staff access to your property to install a benchmark to use as a reference point to measure lake level changes, survey top of casing and to access the wells on your property to measure depths to water.

_____

_____.

This agreement becomes effective as of _____ (month) ____ (day) _____(year). Participation in the program is voluntary and may be terminated at any time at the sole discretion of the participant.

Printed name _____

Signature _____

Date _____

Alaska Hydrologic Survey staff can notify the property owner 24 to 48 hours before each site visit via the contact information provided below:

mobile phone: _____
home phone: _____
email address: _____

Subject: Re: Central Monofill Services

Hi Susan,

I estimate that the review will take about 16 hours for a total cost of $2400.00 to conduct the review and prepare draft and final letters describing the results of the review. While I endeavor to make the draft letter as "perfect" as possible, I have found that it is frequently useful to prepare a draft letter and have a client review it to make sure that everything is clear and with sufficient detail or backup for the intended use. If the review goes smoothly, I could attend a meeting in Palmer to go over the packet and my review with the above budget, otherwise we could do a teleconference if needed.

I am not anticipating any major schedule conflicts during the next month or two.

Thanks,

Jim Munter, Principal Hydrogeologist

Code Compliance

Dear Susan, I would like to make a request, In light of concerns in regards to monofills and discoveries made about the proposed site during the 2013 application by Central Monofill Services. Due to the potential of water table and other contamination in the area around the proposed dump site and the lack of confirmed and reliable data on the spread of any contamination if it should occur. Can the property owner notification area around the proposed site be expanded significantly. I think any property owner that may suffer in the near or far future if water table or other contamination should occur has the right to be notified and heard by the borough before any CUP is granted. The fact that this activity is even being considered within the Core Use Area as established by the Borough, and against the Core Use Area Plans land use Guidelines should warrant that the greater majority of this area be notified. The Core Use Area was established in part so that people moving to and living within this area would have a reasonable expectation of land usage allowed by government. Now that it seems government may be choosing to ignore this plan for area growth, it seem to me they have the obligation to notify all parties within that plan area who worked in conjunction with government to establish it.

Thank You,
Richard Harbuck

Code Compliance

Dear Susan, I would like to make a request, in light of concerns in regards to monofills and discoveries made about the proposed site during the 2013 application by Central Monofill Services. Due to the potential of water table and other contamination in the area around the proposed dump site and the lack of confirmed and reliable data on the spread of any contamination if it should occur. Can the property owner notification area around the proposed site be expanded significantly. I think any property owner that may suffer in the near or far future if water table or other contamination should occur has the right to be notified and heard by the borough before any CUP is granted. The fact that this activity is even being considered within the Core Use Area as established by the Borough, and against the Core Use Area Plans land use Guidelines should warrant that the greater majority of this area be notified. The Core Use Area was established in part so that people moving to and living within this area would have a reasonable expectation of land usage allowed by government. Now that it seems government may be choosing to ignore this plan for area growth, it seem to me they have the obligation to notify all parties within that plan area who worked in conjunction with government to establish it.

Thank You,
Richard Harbuck

Hi Lori:

I am processing the conditional use permit for Central Monofill Services proposed monofill outside of Palmer. I know the ADEC permit was not issued since the MSB permit was not approved. However, I was wondering if there is a draft permit that I could review. CMS's application material states that " ADEC reviewed the CMS Monofill Permit application for this site and has approved the permit conditioned upon receipt of the MSB CUP".

In addition, could you send me a copy of the Alaska Demolition permit for their operation in Palmer.

If you have any questions or need additional information please let me know.

Susan,

We do not have a draft permit, as the application has been on hold. We had reviewed the application and determined that it met the requirements for an inert waste monofill, and had posted a public notice. However, if they make even minor changes to the plan, the must submit a new application, including posting another public notice. At this point, the permit would likely include any stipulations required by the conditional use permit as well as others initiated by ADEC.

Attached is the permit for the Alaska Demolition Palmer Inert Waste Monofill.

Please call or email if you have any additional questions.

Thanks,
Lori

RE: Solid Waste Disposal Permit, Palmer Reclamation Site – Inert Waste Monofill
Permit No. SWZA004-14

Dear Mr. Green:

The Alaska Department of Environmental Conservation (ADEC) has completed its evaluation of your permit application for the Palmer Reclamation Site Inert Waste Monofill. This permit is being issued in accordance with Alaska Statute (AS) 46.03; Title 18, Chapter 15 of the Alaska Administrative Code (18 AAC 15); and the Solid Waste Regulations (18 AAC 60). Please review the conditions and stipulations in the permit and ensure that people who conduct waste disposal operations understand them.

Any person who disagrees with this decision may request an adjudicatory hearing in accordance with 18 AAC 15.195 - 18 AAC 15.340 or an informal review by the Division Director in accordance with 18 AAC 15.185. **Informal review requests** must be delivered to the Division Director, Alaska Department of Environmental Conservation, 555 Cordova Street, Anchorage, AK 99501 within 15 days of the permit decision. **Adjudicatory hearing requests** must be delivered to the Commissioner of the Department of Environmental Conservation, 410 Willoughby Avenue, Suite 303, Juneau, Alaska 99801, within 30 days of the permit decision. If a hearing is not requested within 30 days, the right to appeal is waived. Even if an adjudicatory hearing has been requested and granted, all permit conditions remain in effect unless a stay has been granted.

If you have any questions, or require any additional information, please contact me at (907) 269-7622 or by email at *Lori.Aldrich@Alaska.gov*.

Sincerely,

Lori Aldrich
Solid Waste Program Coordinator

Attachment: **Permit # SWZA004-14 expiring on April 1, 2014**

STATE OF ALASKA
DEPARTMENT OF ENVIRONMENTAL CONSERVATION
555 Cordova Street
Anchorage, AK 99501

SOLID WASTE DISPOSAL PERMIT

Permit No. **SWZA004-14**

Date Issued: April 23, 2009
Date Expires: April 1, 2014

The Alaska Department of Environmental Conservation (ADEC), under authority of AS 46.03 and 18 AAC 60, issues a solid waste disposal permit to:

Alaska Demolition, LLC
2903 Tanglewood
Anchorage, AK 99501

Palmer Reclamation Site – Inert Waste Monofill

and designated representatives for the management and operation of an inert solid waste landfill. It authorizes the disposal of construction and demolition debris and other inert waste.

The landfill is located within the North ½ of the Southeast ¼, Section 8, Township 17 North, Range 2 East, Seward Meridian.

The permit holder shall manage and operate the facility in accordance with 18 AAC 60 and the incorporated permit application materials:

1. Permit application dated April 1, 2009
2. Operations Plan dated March 30, 2004, and addendum dated, December 29, 2005.

Waivers

Alaska Demolition, LLC has requested a waiver for the requirement for design documents to be stamped and sealed by a registered engineer. The monofill is constructed in an existing gravel pit with limited additional design features. ADEC approves the waiver with the condition that the site is surveyed annually and the site plan updated to reflect the survey information.

Specific Conditions

1. Erect and maintain signs at the facility entrance which clearly identify
   - Landfill owner/operator
   - Hours of operation
   - Emergency contacts
   - Prohibited waste, including, but not limited to liquid waste, food waste, oily waste, hazardous waste, and polychlorinated biphenyls.

2. Maintain a minimum separation distance of 50 feet between the active placement of solid waste and the facility boundary.

3. Maintain a separation distance of 500 feet between active placement of solid waste and any drinking water well.

4. Prohibit the disposal of regulated asbestos containing material as defined under 18 AAC 60.990(108).

5. Handle non-RACM waste to prevent the release of asbestos fibers to the air or to surface water
   - Place non-RACM waste directly at the working face of the landfill
   - Do not compact uncovered non-RACM waste
   - Cover non-RACM waste within 24 hours after placement.

6. Update financial assurance documentation annually, no later than April 1.

General Conditions

1. Access and inspection - The Permittee shall allow the Commissioner or his representative access to the permitted facilities at reasonable times to conduct scheduled or unscheduled inspections or tests to determine compliance with this permit, State laws, and regulations.

2. Information access - Except for information relating to confidential processes or methods of manufacture, all records and reports submitted in accordance with the terms of this permit shall be available for public inspection at the State of Alaska, Department of Environmental Conservation, 555 Cordova Street, Anchorage, AK 99501.

3. Civil and criminal liability - Nothing in this permit shall relieve the Permittee from civil or criminal penalties for noncompliance, whether or not such noncompliance is due to factors beyond his control, including, but not limited to, accidents, equipment breakdowns, or labor disputes.

4. Availability - The Permittee shall post or maintain a copy of this permit available to the public at the disposal facility.

5. Adverse impact - The Permittee shall take all necessary means to minimize any adverse impacts to the receiving waters or lands resulting from noncompliance with any limitation specified in this permit, including any additional monitoring needed to determine the nature and impact of the noncomplying activity. The Permittee shall clean up and restore all areas adversely impacted by the noncompliance.

6. Cultural or paleontological resources - Should cultural or paleontological resources be discovered as a result of this activity, work which would disturb such resources is to be stopped, and the State Historic Preservation Office, Division of Parks and Outdoor Recreation, Department of Natural Resources, is to be notified immediately (907-269-8721).

7. Applications for renewal - In accordance with 18 AAC 15.100(d), applications for renewal or amendment of this permit must be made no later than 30 days before the expiration date of the permit, or the planned effective date of the amendment.

8. Other legal obligations - The requirements, duties, and obligations set forth in this permit are in addition to any requirements, duties, or obligations contained in any permit that the Alaska Department of Environmental Conservation or the U.S. Environmental Protection Agency has issued or may issue to the Permittee. This permit does not relieve the Permittee from the duty to obtain any and all necessary permits and to comply with the requirements contained in any such permit or with applicable state and federal laws and regulations. All activities conducted by the Permittee pursuant to the terms of this permit and all plans implemented by the Permittee pursuant to the terms of this permit shall comply with all applicable state and federal laws and regulations.

9. Pollution prevention - In order to prevent and minimize present and future pollution, when making management decisions that affect waste generation, the Permittee shall consider the following order of priority options: waste source reduction; recycling of waste; waste treatment; and waste disposal.

This permit expires on **April 1, 2014**, and may be revoked or amended in accordance with 18 AAC 60.260. The permit can be renewed if the facility will operate beyond this date. To avoid expiration of this permit, a renewal application must be submitted to ADEC at least 30 days before the expiration date, as set forth in 18 AAC 15.110.

Susan,

Whether they must submit a new application remains to be seen, and will be determined by ADEC. They are required to submit their more comprehensive hydrological study and any potential changes as they relate to that. In addition, I presume they have made some concessions to the Borough to resubmit for the conditional use permit.

Thanks for keeping me posted.

Hi Lori:

I have a couple of questions regarding CMS's proposed monofill. I attached one of the cross sections drawings from their application material for your reference.

1. Can fill be used to meet the 10' separation from the watertable?
2. If fill can be used, what types of material are acceptable for fill?
3. Do they have to disclose the type of material that was used for fill?

Thanks for your help!

Hi Rich:

I am processing a conditional use permit for a proposed monofill for construction and demolition material. Could you take a look at their info on Fire Risk, pages 17 - 18 and let me know what your think. Can you give me any info on the combustibility of the shredded residual waste and the combustibility of the tire bales.

I have attached the application material (minus most of the attachments) and the figures for your reference.

The site is part of the old Granite gravel pit just outside of Palmer.

Thanks for your help!!!!!!!!!!!!!!!!

Hi Susan,

Looks good. They are using their Anchorage facility for the actual grinding up of the product that cannot be recycled. Our biggest problems in the landfills are the residential waste. This C/D waste has gone thru a process so we know what it is and more important that it is not on fire. With residential waste they could have emptied their wood stove into the can and we do not know that until the dump is on fire. They have a water supply for summer but in winter the pond may not work so well. The city of Palmers water system runs in front of the property so it would be easy to get hydrants added on the property which gives a year round water supply. This is in the Greater Palmer Fire Department area and in the State Fire Marshal is the authority having jurisdiction. I am going to forward this to the Fire Chief there in Palmer if that is ok just so he has a heads up.

Hi Rich:

I am processing a conditional use permit for a proposed monofill for construction and demolition material. Could you take a look at their info on Fire Risk, pages 17 - 18 and let me know what your think. Can you give me any info on the combustibility of the shredded residual waste and the combustibility of the tire bales.

I have attached the application material (minus most of the attachments) and the figures for your reference.

The site is part of the old Granite gravel pit just outside of Palmer.

Thanks for your help!!!!!!!!!!!!!!!!

So what type of fire risk are we looking at with the tire bales?

When I send this out for official review, who should I send it to at the Palmer Fire Dept? Anybody in particular at the State Fire Marshal?

Thanks,
Susan

Hi Susan,

Looks good. They are using their Anchorage facility for the actual grinding up of the product that cannot be recycled. Our biggest problems in the landfills are the residential waste. This C/D waste has gone thru a process so we know what it is and more important that it is not on fire. With residential waste they could have emptied their wood stove into the can and we do not know that until the dump is on fire. They have a water supply for summer but in winter the pond may not work so well. The city of Palmers water system runs in front of the property so it would be easy to get hydrants added on the property which gives a year round water supply. This is in the Greater Palmer Fire Department area and in the State Fire Marshal is the authority having jurisdiction. I am going to forward this to the Fire Chief there in Palmer if that is ok just so he has a heads up.

Not much. They are compacted and then covered with dirt. All the waste has been gone thru and then chewed up and then gets compacted. The tire bales are not much of a risk. If it were open tire piles this would be a significant risk and the building could speaks to it. This is ok.

Hello Susan, The Gateway Community Council Exutive Board will be sending a letter of request to expand the notification area regarding the CMS monofill CUP. I informed them that you would forward all requests to the proper people, instead they would like to address the letter to the person at the top. I assume that would be Lauren Driscoll, would this be correct? Richard H.

Hi Eileen,
I am requesting that the notification area for the CUP on the mono fill, but extended to a MUCH larger area in Palmer. The home owners in the neighboring subdivisions like Pioneer Meadows and Crimsonview have wells very near this property and possibly attached to the aquifer. I believe the CITY OF PALMER, who was NOT notified last time, is an adjoining neighbor of this property and needs to be notified also. Please let me know if this expansion can be put in place.
Thank you

Introduced by: Mayor Cooper
Date: January 27, 2004
Public Hearing: February 10, 2004
Action: During council discussion postponed to a time definite of the February 24, 2004, council meeting
Date: February 24, 2004 Substitute
Action: Adopted
Vote: Unanimous

CITY OF PALMER, ALASKA

ORDINANCE NO. 612-Z-57 (SUBSTITUTE)

AN ORDINANCE TO REZONE ALASKA STATE FAIR, INC. PROPERTY, TAX PARCEL D-8, FROM R-1, SINGLE FAMILY RESIDENTIAL, TO I, INDUSTRIAL

WHEREAS, the City of Palmer Planning and Zoning Commission (the Commission) received a request from Alaska State Fair, Inc., to rezone the below described property from R-1, Single Family Residential district to I, Industrial; and,

WHEREAS, the Commission duly gave required notices, held the required public hearing on November 4, 2003, and made its written report, as contained in the Commission's November 4, 2003, minutes of the meeting, of its findings as to such need, justification and effect of the change of zoning and, by unanimous vote, denied the request to rezone the property as I, Industrial, and,

WHEREAS, the decision of the Commission denying the rezone is final unless the initiating party files a written statement with the city clerk requesting that the amendment be considered by the city council in accordance with the procedures of Palmer Municipal Code 17.80.040, and the property owner in this case did file a timely request for such consideration by the City Council, and;

WHEREAS, the City Council duly gave required notices and has duly considered the request to rezone the property, all evidence and testimony presented including any comments of the persons attending the public hearing, and the report and actions of the Commission, and being fully advised in the premises,

The City Council hereby acts as follows:

Section 1. Having considered the effect the proposed change would have on the public health, safety, welfare and convenience, the City Council hereby adopts the following legislative findings:

A. The proposed change to Industrial zoning classification, as restricted by this ordinance, is in accordance with the borough and city comprehensive plans. The use of the property at one time prior to annexation to the city was as a commercial gravel pit, and there currently exists on the property a very large open pit that poses health and safety risks and makes the use of the property for other productive purposes impractical. These risks include not only the risk of injury resulting from the current

configuration of the terrain, but also a risk of ground water contamination presented by drainage patterns in the area. The proposed change will allow reclamation of property for useful purposes and will contribute to making Palmer an attractive place to live; eliminates an unsafe condition and an attractive nuisance; reduces and eventually eliminates the negative impact of an industrial site on adjacent properties; and will encourage the creation of new uses compatible with uses in the adjacent zoning districts following the reclamation of the property.

B. The proposed change is necessary to allow reclamation and establish the long range compatibility of the property with the zoning districts in the neighboring area as the current condition of the property is not compatible with the surrounding area. The property is presently owned by the Alaska State Fair and may possibly be suited for future use by the Fair after reclamation. Anticipated future development in the surrounding area requires that, following reclamation of the gravel pit within a specified, reasonable length of time, the property be re-designated in a more restrictive zoning district to assure its continued compatibility with established and anticipated land use patterns.

C. Public facilities such as schools and utilities are adequate to support the proposed change; however, there are public safety concerns involving truck traffic associated with activities allowed on the property. It is in the public interest to place conditions on truck traffic to and from the property and to divert the traffic away from Inner Springer Loop Road.

D. Changed conditions affecting the subject parcel or the surrounding neighborhood support the proposed change. Development currently taking place in the near vicinity, specifically residential uses, causes increasing public health, safety and welfare concerns over the existing condition of the property as an attractive nuisance and supports the need to abate the condition of the property. Also, increasing demand for useable property in the area supports the need to reclaim the property for meaningful economic use.

E. The proposed change, as restricted by this ordinance, is consistent with the public health, safety, and welfare and does not grant a special privilege to the owners. The public health, safety, and welfare requires that the property be reclaimed from its present unsafe condition. It is appropriate and necessary to allow, for a limited time, the specific industrial activity of filling the pit with inert materials in order to eliminate the unsafe conditions. To assure eventual compatibility of land uses in the area, and to prohibit the expansion of industrial use of the property beyond those activities required to address the overriding public interest to eliminate hazards and unsightly conditions, industrial activities on the property shall be limited by time and extent to those necessary to remedy hazards to public health and safety, and shall not extend beyond those activities that mitigate or eliminate those hazards.

F. Section 17.36.030(B)(1), Palmer Municipal Code, requires an industrial use of property similar to that envisioned to reclaim this property (operation of an inert waste mono-fill to fill the pit) to require a conditional use permit to be granted by the Palmer Planning Commission.

G. In order to address public health, safety, and welfare concerns, including those contained in testimony presented to the City Council, the public interest requires that the Planning Commission approve a conditional use permit imposing conditions on the reclamation activities. In so doing, it is necessary that the Planning Commission

consider the following factors and impose such permit conditions on the reclamation of this property that will:

1. allow only those industrial activities to occur on the property that are necessary to reclaim the property by filling the existing gravel pit with materials authorized by the Alaska Department of Environmental Conservation for disposal on the property;
2. allow the use of gravel materials presently on the property as may be necessary to reclaim the property;
3. allow the use of gravel materials presently on the property as may be necessary to meet the needs of the Alaska State Fair for use on its property;
4. allow the excavation and export of gravel material from the site, provided that:
   i. on an annual basis as of July 31 of each year the areas excavated shall be refilled to eighty-five percent of the excavated volume with exempt material;
   ii. exempt materials delivered to the site shall also be utilized to fill the existing gravel pit area to meet the primary intent of reclaiming the property in a timely manner; and,
   iii. at such time as fifty percent of the surface area of the southern portion of the property, excluding identified buffer areas, has been utilized for excavation of gravel, the property owner shall not excavate additional gravel without approval from the city council, with such approval based on a review that shows reasonable progress in reclaiming the exempt material area of the property in relation to the amount of gravel excavated to that time.
5. place restrictions on truck routes to prevent heavy truck traffic impacts on Inner Springer Loop Road and adjacent properties; and
6. return the property to a more restrictive zoning classification within a reasonable period of time (for example, ten years), or sooner if the reclamation activities are completed in less time.

Section 2. The City Council hereby amends the City of Palmer Zoning Map designation for the following described property from R-1, Single Family Residential, to I, Industrial, subject to the limitations and requirements of section 3 of this ordinance:

Township 17 North, Range 2 East, Section 8, Seward Meridian, Palmer Recording District, tax parcel D-8.

Section 3. In light of the findings expressed above, and to ensure that the use of the property pursuant to this rezoning does serve to advance the public health, safety and welfare of the citizens of Palmer in both the short term and the long term, the City Council further imposes the following limitations and requirements on the use of the property pursuant to the Industrial zoning classification:

A. The industrial use of the property is limited to only the reclamation of the property through the operation of an inert waste mono-fill and those activities incidental thereto that are necessary to reclaim the property in a manner consistent with the findings set forth above.
B. No use of the property authorized by subparagraph A shall commence or continue except in conformance with a conditional use permit approved by the Palmer

Planning Commission, consistent with the above findings.

C. The Industrial zoning classification of this property shall terminate no later than 10 years after the effective date of this ordinance, unless terminated sooner pursuant to subparagraph D or by subsequent rezoning.

D. If prior to ten years after the effective date of this ordinance the Palmer Planning Commission finds that the reclamation of the property has been completed, the Industrial zoning classification shall then terminate on the effective date thereof. Such a finding shall be made only after notice to the property owner and a public hearing.

E. Upon the effective date of termination of the Industrial zoning classification pursuant to subparagraph C or D above, the property shall revert to the zoning classification in effect prior to the adoption of this ordinance (R-1, Single Family Residential), unless otherwise rezoned.

Section 4. Effective Date. This ordinance shall become effective immediately upon its adoption.

Adopted by the City Council of the City of Palmer, Alaska, this 24th day of February, 2004.

Anthony Pippel, Mayor Pro-Tempore

Janette M. Persinger, City Clerk

PLANNING AND ZONING COMMISSION

CONDITIONAL USE PERMIT
Tax Parcel 17N02E08D008

The City of Palmer Planning and Zoning Commission (Commission) upon consideration of an application for conditional use permit by Alaska State Fair, Inc. ("Owner"), hereby approves the use of tax parcel 17N02E08D008 for the use stated in this permit, subject to the conditions, controls, and safeguards stated in this permit. The purpose of this conditional use permit is to insure that the stated uses and appropriate future uses described in the attached reclamation plan will be compatible with the surrounding area and will not create a health or safety hazard to the public.

The Palmer City Council changed the zoning designation of this parcel at its regular meeting of February 24, 2004. The council passed ordinance No. 612-Z-57 (Substitute) (the "ordinance") which is attached and incorporated by reference into this conditional use permit as if fully stated in the permit. The conditions contained in the ordinance and in this permit, when accepted by the Owner's signature below, constitute an agreement between the Owner and the city, which may be enforced by the city pursuant to Palmer Municipal Code Chapter 17.04.

The only allowable Industrial use of the property is described in Section 3 of the ordinance as "reclamation of the property through the operation of an inert waste mono-fill and those activities incidental thereto that are necessary to reclaim the property," (the "Permitted Use") subject to a conditional use permit. Such Permitted Use is permitted on the property only pursuant to this permit under the following conditions:

Permit Term

1. This conditional use permit shall terminate no later than 10 years after the effective date of Ordinance No. 612-Z-57 (Substitute).

2. The Industrial zoning classification of this property shall terminate no later than 10 years after the effective date of Ordinance No. 612-Z-57 (Substitute), unless terminated sooner pursuant to conditions contained within the ordinance.

Other Permits

3. The owner shall comply with all local, state, and federal ordinances, regulations, and statutes applicable to the proposed activities.

4. The owner shall provide copies of all permits issued by state and federal agencies to the City of Palmer prior to commencement of the Permitted Use. The owner shall also provide to the City of Palmer a copy of every application for an amendment to any such permit at the time the application is filed with the permitting agency, and a copy of any amendment approved by the permitting agency shall be provided to the City within five days of issuance.

Other Conditions

The reclamation activity shall be conducted in a manner to minimize the impact on adjacent lands and residents and allow only those industrial activities necessary to reclaim the property to establish the long range compatibility of the property with zoning districts in the neighboring areas. The attached site plan identifies the property and areas within the property, as follows: Area A (general construction and demolition material disposal area), Area B (exempt construction and demolition material disposal area), Area C (gravel extraction and exempt material disposal area), and Area D (gravel extraction and exempt material disposal area).

5. The existing driveway on the Inner Springer Loop which provides access to the eastern edge of the property shall be used only until a new access driveway can be constructed on Rebarchek road, which shall be done as soon as practical and no later than September 5, 2005. Once the new access driveway is opened, the existing driveway on Inner Springer Loop shall be closed to truck traffic.

6. All traffic entering the property shall approach the property from the Glenn Highway, through lands owned by the Alaska State Fair, Inc. and access the property by using Rebarchek Road

7. Fencing shall be installed at the boundary of the property along Rebarchek Road and the Inner Springer Loop Road by June 1, 2004.

8. Gates with locks shall be placed at all entrances to the property. The gates must be locked at all times when supervisory personnel are not on site.

9. A fifty foot setback shall be maintained from all property boundaries in which no excavation of material shall occur.

10. A natural buffer of twenty five feet shall be maintained on the east, west and north boundaries of the property.

11. A natural buffer of fifty feet shall be maintained on the southern boundary of the property.

12. A stormwater plan which meets applicable state law shall be prepared and implemented as approved. Copies of the approved plan and amendments shall be provided to the City according to paragraph 4 of this permit.

13. The owner shall maintain and operate watering equipment on site to prevent and suppress the creation of wind blown dust and dirt.

14. The owner shall pick up and contain any and all paper, debris and other materials on and around the property.

15. All equipment shall be operated in a manner to minimize the disturbance of neighboring residents and shall conform with PMC 8.36.020 F (Nuisances, Specific Acts Designated – Noise) and PMC 8.36.025 (Certain Acts Requiring a Permit).

16. The owner shall conduct Permitted Use activities on the property only between the hours of 6:00 am to 10:00 pm, Monday through Sunday.

17. To prevent accumulation of uncovered and exposed debris, the placement of construction and demolition debris shall be executed by the construction of defined "cells" or active fill zones with average dimensions of sixty feet wide by 150 feet in length and ten feet in depth. Each cell shall be covered with clean material when fully constructed.

18. Any portion of the property from which gravel is extracted pursuant to this permit shall be brought back to original grade by the fill and placement of mineral soils, exempt fill and land clearing debris.

19. Except as provided in the following paragraph, exempt fill consists of stumps, brush, peat, and similar land clearing debris; clay, silt and other mineral soils; and other items as listed in 18 AAC 60.005.

20. For purposes of this permit, exempt fill specifically excludes the following material and other similar material:
    a. domestic wastewater, nondomestic wastewater, and other wastes that are subject to a permit under AS 46.03, 18 AAC 72, or 33 U.S.C. 1342 (Federal Water Pollution Control Act, sec. 402), as amended through August 21, 1998;
    b. sewage, septage and septic tank pumpings, regardless of the amount of solids and regardless of whether regulated under 18 AAC 72

21. The eastern and southern portions of the property (Areas B and C, respectively) used to accept exempt fill material and extract gravel shall be operated in a manner to minimize the total excavated area at any one time. As of July 31 of each year, the areas excavated pursuant to this permit shall be refilled to not less than eighty-five percent (85%) of the excavated volume with exempt materials.

22. For purposes of section 1.G. 4. iii. of the ordinance, the boundary of the area representing fifty percent of the southern portion of the property is shown on the attached map as a dashed line running parallel to and seven hundred (700) feet west of the east property boundary.

23. Excavation of all side slopes shall not exceed one and one half to one (1.5/1). Within 180 days after issuance of this permit, all existing side slopes shall be reduced to not exceed one and one half to one.

24. The depth of gravel extraction shall not exceed a depth of 130 feet above mean sea level, as indicated on the September 2003 "Site Map-Fig.2" prepared by Shannon and Wilson, Inc.

25. Gravel extraction on the eastern and southern portions of the property shall cease when the existing pit (Areas A and B) has been filled and brought back to the grade of adjacent undisturbed land.

26. The completed landfill cover shall be graded to promote surface water runoff and be in compliance with 18AAC60.460.

27. Every term and condition of this permit is binding upon the Owner, Owner's assigns and successors in interest, and every person occupying or operating on the property. The use of the term Owner in reference to the terms and condition of this permit shall be construed to include every person operating on the property by, through, or under the authority or consent of the Owner.

Any changes, alterations or deletions of the intended uses, unless permitted by ordinance, must receive prior approval of the Planning and Zoning Commission.

Dated this 8th day of March, 2004, for the Palmer Planning and Zoning Commission

Hey Susan,

Attached are copies of Ordinance 14-001-Z-1 for the rezone that just passed on January 28, 2014 and the unsigned copy of CUP #14-001. CUP#14-001 is not signed yet since the rezone just passed a few day ago.

CITY OF PALMER, ALASKA

Ordinance No. 14-001-Z-1

An Ordinance of the Palmer City Council Amending the Zoning Map to Revise the Designation of Tax Parcel D8, Section 8, Township 17 North, Range 2 East, Seward Meridian from R-1, Single Family Residential to I-Industrial with Special Limitations

THE CITY OF PALMER, ALASKA ORDAINS:

Section 1. Classification. This ordinance shall be permanent in nature and shall be incorporated into the Palmer Municipal Code.

Section 2. Severability. If any provision of this ordinance or any application thereof to any person or circumstance is held invalid, the remainder of this ordinance and the application to other persons or circumstances shall not be affected thereby.

Section 3. Authority for zoning map amendments with special limitations. Pursuant to 17.80.015, the City Council may include special limitations that restrict structures, or use of land to a degree greater than otherwise provided for by the zoning district to which the property is rezoned by amendment.

Section 4. Authority and legislative findings. Pursuant to 17.80.040, the City Council hereby adopts the following zoning map amendment in accordance with the legislative findings set below:

WHEREAS, the City of Palmer Planning and Zoning Commission (the Commission) received an application on October 11, 2013, from Steve Agni, Development Manager for Alaska Demolition, LLC, the property owners of Tax Parcel D8 located in Section 08, Township 17

North, Range 2 East, Seward Meridian, Alaska to rezone the subject property from R-1 Single Family Residential to I-Industrial with Special Limitations; and

WHEREAS, the Commission duly gave required notices, held its required public hearing on November 21, 2013, made a written report of its decision as to such need, justification and effect of the change of zoning in Commission Resolution 13-012, and voted unanimously to recommend that such amendment to the zoning map be approved; and

WHEREAS, the Commission adopted finding of fact as to such need, justification and effect of the change of zoning on November 21, 2013; and

WHEREAS, the City Council duly gave required notices, held its required public hearing on this date, and has duly considered the request to rezone the property, all evidence and testimony presented including any comments of the persons attending the public hearing, the findings of fact set forth in Planning and Zoning Commission Resolution 13-012, and the recommendation of the Commission; and

Section 5. The City of Palmer Zoning Districts map dated March 2012 is hereby amended to revise the zoning designation of Tax Parcel D8 located in Section 08, Township 17 North, Range 2 East, Seward Meridian, Alaska from R-1 Single Family Residential to I-Industrial subject to the Special Limitations and requirements of Section 6.

Section 6. To ensure that the use of the property pursuant to this rezoning does serve to advance the public health, safety and welfare of the citizens of Palmer in both the short term and the long term, the City Council further imposes the following limitations and requirements on the use of the property pursuant to the Industrial zoning classification:

A. The industrial use of the property is limited to only the reclamation of the property through the operation of an inert waste mono-fill and those activities incidental thereto that are necessary to reclaim the property in a manner consistent with the findings set forth in Planning and Zoning Commission Resolution 13-012.
B. No use of the property authorized by subparagraph A shall commence or continue except in conformance with a conditional use permit approved by the Palmer Planning Commission, consistent with the above findings.
C. The Industrial zoning classification of this property shall terminate no later than 10 years after the effective date of this ordinance, unless terminated sooner pursuant to subparagraph D or by subsequent rezoning.
D. If prior to ten years after the effective date of this ordinance the Palmer Planning Commission finds that the reclamation of the property has been completed, the Industrial zoning classification shall then terminate on the effective date thereof. Such a finding shall be made only after notice to the property owner and a public hearing.
E. Upon the effective date of termination of the Industrial zoning classification pursuant to subparagraph C or D above, the property shall revert to the zoning classification in effect prior to the adoption of this ordinance (R-1, Single Family Residential), unless otherwise rezoned.

Section 7. Effective Date. Ordinance 14-001-Z-1 shall take effect upon adoption by the Palmer City Council.

Passed and approved this twenty-eighth day of January, 2014.

City of Palmer
PLANNING AND ZONING COMMISSION

Conditional Use Permit #14-001
Tax Parcel ID #: 17N02E08D008

The City of Palmer Planning and Zoning Commission (Commission) upon consideration of an application for a conditional use permit by Alaska Demolition LLC ("Owner"), hereby approves the use of tax parcel 17N02E08D008 for the use stated in this permit subject to the conditions, controls, and safeguards stated in this permit. The purpose of this conditional use permit is to insure that the stated uses and appropriate future uses described in the reclamation plan attached to the 2004 CUP will be compatible with the surrounding area and will not create a health or safety hazard to the public.

The Palmer City Council approved the zoning designation of I-Industrial with Special Limitations for this parcel at its regular meeting of January 28, 2014. The City Council passed Ordinance 14-001-Z-1 which is attached and incorporated by reference into this conditional use permit as is fully stated in the permit. The conditions contained in the ordinance and in this permit, when accepted by the Owner's signature below, constitute an agreement between the Owner and the city, which may be enforced by the city pursuant to Palmer Municipal Code Chapter 17.04.

The only allowable Industrial use of the property is described in Section 3 of Ordinance No. 612-Z-57 (Substitute) as "reclamation of the property through the operation of an inert waste mono-fill and those activities incidental thereto that are necessary to reclaim the property," (the "Permitted Use") subject to a conditional use permit. Such Permitted Use is permitted on the property only pursuant to this permit under the following conditions:

<u>Permit Term:</u>

1) This conditional use permit shall become effective only upon the approval of Ordinance No. 14-001-Z-1, zone change from R-1 Single-family Residential to I-Industrial with Special Limitations, for a period of 10 years with a review by the Planning and Zoning Commission in 5 years.

2) The Industrial zoning classification of this property shall terminate no later than 10 years after the effective date of Ordinance No. 14-001-Z-1, unless terminated sooner pursuant to conditions contained within the ordinance.

<u>Other Permits:</u>

3) The owner shall comply with all local, state, and federal ordinances, regulations, and statutes applicable to the proposed activities.

4) The owner shall provide copies of all permits issued by state and federal agencies to the City of Palmer prior to commencement of the Permitted Use. The owner shall also provide to the City of Palmer a copy of every application for an amendment to any such permit at the time the application is filed with the permitting agency, and a copy of any amendment approved by the permitting agency shall be provided to the City within five days of issuance.

<u>Other Conditions</u>

The reclamation activity shall be conducted in a manner to minimize the impact on adjacent lands and residents and allow only those industrial activities necessary to reclaim the property to establish the long range compatibility of the property with zoning districts in the neighboring areas. The attached site plan identifies the property and areas within the property, as follows: Area A (general construction and demolition material disposal area), Area B (exempt construction and demolition material disposal area), Area C (gravel extraction and exempt material disposal area), and Area D (gravel extraction and exempt material disposal area).

5) The existing driveway on the Inner Springer Loop which provides access to the eastern edge of the property shall be used only until a new access driveway can be constructed on Rebarchek Road, which shall be done as soon as practical and no later than September 5, 2005. Once the new access driveway is opened, the existing driveway on Inner Springer Loop shall be closed to truck traffic. [Construction of access onto Rebarchek Road has been completed]

6) All traffic entering the property shall approach the property from the Glenn Highway, through lands owned by the Alaska State Fair, Inc. and access the property by using Rebarchek Road.

7) Fencing shall be installed at the boundary of the property along Rebarchek Road and the Inner Springer Loop Road by June 1, 2004. [This condition has been met.]

8) Gates with locks shall be placed at all entrances to the property. The gates must be locked at all times when supervisory personnel are not on site.

9) A fifty foot setback shall be maintained from all property boundaries in which no excavation of material shall occur.

10) A natural buffer of twenty five feet shall be maintained on the east, west and north boundaries of the property.

11) A natural buffer of fifty feet shall be maintained on the southern boundary of the property.

12) A stormwater plan which meets applicable state law shall be prepared and implemented as approved. Copies of the approved plan and amendments shall be provided to the City according to paragraph 4 of this permit. [A storm water plan dated November 8, 2005 by Shannon & Wilson, Inc. is on file in our office.]

13) The owner shall maintain and operate watering equipment on site to prevent and suppress the creation of windblown dust and dirt.

14) The owner shall pick up and contain any and all paper, debris and other materials on and around the property.

15) All equipment shall be operated in a manner to minimize the disturbance of neighboring residents and shall conform with PMC 8.36.020 F (Nuisances, Specific Acts Designated – Noise) and PMC 8.36.025 (Certain Acts Requiring a Permit).

16) The owner shall conduct Permitted Use activities on the property only between the hours of 6:00 am to 10:00 pm, Monday through Sunday.

17) To prevent accumulation of uncovered and exposed debris, the placement of construction and demolition debris shall be executed by the construction of defined "cells" or active fill zones with average dimensions of sixty feet wide by 150 feet in length and ten feet in depth. Each cell shall be covered with clean material when fully constructed.

18) Any portion of the property from which gravel is extracted pursuant to this permit shall be brought back to original grade by the fill and placement of mineral soils, exempt fill and land clearing debris. [Amended December 19, 2013; new condition listed as #37.]

19) Except as provided in the following paragraph, exempt fill consists of stumps, brush, peat, and similar land clearing debris; clay, silt and other mineral soils; and other items as listed in 18 AAC 60.005.

20) For purposes of this permit, exempt fill specifically excludes the following material and other similar material:
   a. domestic wastewater, nondomestic wastewater, and other wastes that are subject to a permit under AS 46.03, 18 AAC 72, or 33 U.S.C. 1342 (Federal Water Pollution Control Act, sec. 402), as amended through August 21, 1998;
   b. sewage, septage and septic tank pumpings, regardless of the amount of solids and regardless of whether regulated under 18 AAC 72

21) The eastern and southern portions of the property (Areas B and C, respectively) used to accept exempt fill material and extract gravel shall be operated in a manner to minimize the total excavated area at any one time. As of July 31 of each year, the areas excavated pursuant to this permit shall be refilled to not less than eighty-five percent (85%) of the excavated volume with exempt materials.

22) For purposes of section 1.G. 4. iii. of the ordinance, the boundary of the area representing fifty percent of the southern portion of the property is shown on the attached map as a dashed line running parallel to and seven hundred (700) feet west of the east property boundary.

23) Excavation of all side slopes shall not exceed one and one half to one (1.5/1). Within 180 days after issuance of this permit, all existing side slopes shall be reduced to not exceed one and one half to one. [This condition has been met.]

24) The depth of gravel extraction shall not exceed a depth of 130 feet above mean sea level, as indicated on the September 2003 "Site Map-Fig.2" prepared by Shannon and Wilson, Inc.

25) Gravel extraction on the eastern and southern portions of the property shall cease when the existing pit (Areas A and B) has been filled and brought back to the grade of adjacent undisturbed land. [Amended December 19, 2013; new condition listed as #37.]

26) The completed landfill cover shall be graded to promote surface water runoff and be in compliance with 18AAC60.460.

Best Management Practices

27) All disposals of exempt or Construction Demolition materials (C & D) in the Mono-fill area require written authorization to dispose by Management Site Representative (MSR).

28) Mono-fill shall be gated and locked when not in operation or when not supervised by MSR. All visitors to the Site must check in with MSR prior to disposal of any materials.

29) All C & D disposal loads entering the site must be secured and covered with a tarp or other containment and the loads manifested by MSR.

30) All C & D loads are placed into separate earthen cells contained by gravel backfills on the bottom of the cell and all four sides and then covered by not less than one foot of backfill.

31) All cells are capped and covered not less than weekly. Cells to be covered daily if wind or other conditions require.

32) Supervisory labor to be present on all operating days and Mono-fill area to be inspected daily for compliance.

33) Surrounding earthen berm and drainage ditches are inspected not less than weekly or more seasonally, as required to ensure correct conditions.

34) Annual topographic survey of the site to be conducted by Alaska Demolition and cubic volume of site disposal calculated by registered licensed surveyor quantifying disposal fills and gravel extractions if any during the annual period preceding the date of survey.

Additional Conditions:

35) The Conditional Use Permit #14-001 shall terminate no later than 10 years after the effective date of Ordinance No. 14-001-Z-1.

36) There shall be a mandatory review five years after the effective date of Conditional Use Permit #14-001 by the Planning and Zoning Commission.

37) There shall be no gravel extraction allowed.

38) The site shall be two-thirds complete within 5 years of the effective date of Conditional Use Permit #14-001.

39) A reclamation bond shall be required in an amount sufficient to cover the total costs of reclamation.

Any changes, alterations or deletions of the intended uses, must receive prior approval of the Planning and Zoning Commission.

Every term and condition of this permit is binding upon the Owner, Owner's assigns and successors in interest, and every person occupying or operating on the property. The use of the term Owner in reference to the terms and conditions of this permit shall be construed to include every person operating on the property by, through, or under the authority or consent of the Owner.

Good Morning Mr. Johnson,

Thank you for contacting me and sharing the information. I believe Mr. Charlie Cobb of the State of Alaska - Dam Safety Program, is working with the spillway/dam owner to address such concerns. I do not have much detail on the issue and what is being required of the spillway owner, but I am sure that Mr. Cobb would be more than willing to provide you with the information.

I have included Mr. Cobb and Ms. Eldred in this email for your convenience. Thank you for your time and consideration on this matter.

Respectfully,

Subject:

Hi Mark, I am sending you a few photos of Irene Lake and the consequences of the CMS spillway. Water is flowing continually at a rate that prevents freezing. There is unfrozen surface water in the Anchorage Sand and Gravel pit. Irene Lake shows a level almost 3 foot above the benchmark placed just a few years ago. Keep in mind the benchmark was put there after the levels had already risen more than 3 feet. Please note the color of the frozen water in the pictures. Laura Eldridge, with the D.E.C. Has done some water testing and found high levels of iron oxide. She can be reached at 376-1855.
When CMS put in their spillway they opened a can of worms that the gravel companies had been trying to hide for years.

Susan,

I apologize for the late reply, I am just going thru to see if I missed any emails. They have not provided the financial assurance at this point – this generally does not happen until the permit is ready to be issued. We have agreed on a closure cost and they have documentation to support their cost.

Susan,
Straight form the regulations:

18 AAC 60.265. Proof of financial responsibility. Unless the applicant has provided equivalent surety through a government agency or has demonstrated financial assurance under 18 AAC 60.398, the department will require proof of financial responsibility to cover the cost of closing a landfill and, if monitoring is required, the cost of post-closure monitoring if the department determines proof of financial responsibility is necessary to protect the public health, safety, or welfare, or the environment. Proof of financial responsibility under this section may be demonstrated by self-insurance, insurance, surety, or other guarantee approved by the department to assure compliance with applicable closure standards and post-closure monitoring requirements. (Eff. 1/28/96, Register 137; am 10/29/98, Register 148)

Most Companies use insurance, bonding, or a letter of credit.

Shane Durand
Central Monofill Services
311 N. Sitka Street
Anchorage, AK 99501

SUBJECT: **Central Monofill Services Conditional Use Permit Application**
PROPERTY ID#: 17N02E18C010 &17N02E19B006

Dear Mr. Durand:

Borough staff has reviewed the application material for the proposed monofill on the above referenced property and have determined that the following information will need to be submitted and/or clarified before we can process the conditional use permit application:

1. The Borough hired J.A. Munter Consulting, Inc. to review the application material. A copy of Munter's report, dated February 7, 2014, is attached for your review and comments. In addition to specific issues outlined below, address all issues raised in the Munter report.

2. The application material states *"There are three industrial ponds located on the northern half of the property which cover 66 of the acres". "Of the remaining 52 acres, the monofill footprint is proposed to be 35.5 acres with 16.5 acres used for recycling operations". "The CUP is needed for 52 acres of the property".* The site plan does not depict the conditionally permitted area. The proposed permitted area is irregular and does not correspond to lot lines. A surveyed delineation of the 52 acre boundary must be shown on the site plan. MSB 17.60.040(B) *Site Plan* requires *"the specific location of the use or uses to be made of the development shall be submitted with the application".*

3. Do you have a drainage plan for this site? If so, provide a copy. For example, what direction will material flow off the monofill? What direction will surface water be draining during construction of the monofill? MSB code section 17.60.040(B) *Site Plan*, states that *"drainage"* must be shown on the site plan.

4. Is there a SWPPP (Storm Water Pollution Prevention Plan) for this site? If not, explain why one is not required?

5. Please address the State of Alaska, Department of Transportation's plans for widening the Glenn Highway and placing an intersection at Colleen Street and how that might affect this project.

6. Provide a copy of the wetlands review performed by Hemlock Scientific, as addressed on Page 15 of 38 of the application material.

7. Page 16 of 38 states *"Water level data is being shared with Alaska Department of Natural Resources for regional study of ground water table elevations"*. Provide a copy of all water level data that you have submitted to ADNR in regard to this project.

8. Page 17 of 38 states *"Alaska Department of Environmental Conservation (ADEC) reviewed the CMS Monofill Permit application for this site and has approved the permit conditioned upon receipt of the MSB CUP"*. ADEC has indicated to the borough that the permit has not been approved (See attached e-mail from ADEC). Please clarify and provide a copy of any approved ADEC permit.

9. Page 21 of 38 states *"The adjoining residential lots are screened from view of the property by trees"*. Page 28 of 38 states *"The vegetation that is remaining on site is the forest located along the top of the mined banks and helps create a visual barrier between the public and the CUP activities. The existing trees will be left in place and used as a visual and noise buffer"*. The monofill goes to the top of the bluff. It is not appropriate to use adjacent properties for the buffer. Any buffer should be located on your property. Provide a plan for buffering the neighboring properties as the monofill is built up and out towards those properties.

10. Page 22 of 38 states *"per the ADEC permit municipal and household waste will not be accepted at the facility"*. Provide a specific list of materials that can be accepted at the facility. For example, are the following items part of the residual material being deposited in the monofill: pressure treated wood, containers that contain residual materials, drywall, lead paint, formaldehyde containing materials, glues, mastics, and adhesives. What is the volume of residual material accepted? Are residues not considered hazardous due to their volume compared to the total cumulative volume?

11. Page 22 of 38 states *"Loads hauled into the facility that have not been previously inspected by CRS personnel will be dumped onto a lined pad for inspection"*. Page 35 of 38, #4, also states *"All waste delivered directly to the monofill is first placed within a lined area and inspected"*. Page 29 Sequence of Fill, does not address the separate inspection area. It states that trucks will place their loads in the operational cell. Page 37 of 38, #12, does not discuss this lined inspection pit as a non-permeable surface at the site. Clarify these inconsistencies and explain what is the actual process. Is the lined pad nonpermeable? In addition, will this inspection pad be moved around the site or will it remain in the same place so that it can be shown on the site plan?

12. Page 22 of 38 discusses the inspection pad that will be capped with 2" of soil. What is the plan for disposal of this soil? Will this soil be tested prior to its disposal or use? What is the plan for managing the run-off coming from the inspection area?

13. Page 22 of 38 discusses the careful handling of "hazardous wastes". The proposed monofill proposes to exclude "hazardous waste". It is not clear what this means and in

particular, that all waste that may be hazardous to water supplies will be excluded. Provide a specific list of everything that is tested for in the Building Material Survey.

14. Page 22 of 38 states that CRS and CMS have specific policies outlined in the Operations Plan. Provide a copy of the CRS and CMS Operations Plan.

15. Pages 22 - 23 of 38 states in part *"suspect materials delivered to CRS are tested and, if found, removed from the waste stream..."*. What criteria will be used to determine suspect materials?

16. Page 23 of 38 states *"suspect material will be tested in accordance with regulatory required test methods to identify hazardous materials content, if any"*. How regularly will Toxicity Characteristic Leaching Procedure (TCLP) occur? Does visually seeing paint make it "suspect"? Will any materials with lead paint be accepted?

17. Page 23 of 38 regarding asbestos. Asbestos will be placed in plastic bags which heavy equipment can perforate. Asbestos does not dissolve, however, it does become easily airborne. The fences proposed to stop blowing trash on a windy day will do nothing to stop asbestos. What type of fence will surround the asbestos cell? What is your policy for handling RACM during the wind?

18. Page 30 of 38 states *"Other materials deposited into the monofill are placed within the cells and will be covered intermittently, however not necessarily daily"*. Page 18 of 38 states *"Regularly covering the waste with soil further prevents blowing debris"*. What is meant by "covered intermittently" and "regularly covering"?

19. Page 31 of 38 states *"the ADEC permit requires the owner to provide bonding or other financial assurance to cover the cost of monofill closure"*. CMS also claims that it has *"sufficient Environmental and Pollution Insurance to cover this project"*. Provide copies of the bond, insurance policy and certificate of insurance.

20. Page 34 of 38 Hours of Operation. How will CMS be handling hours of operation during the Alaska State Fair?

21. What will be the actual maximum height of the finished monofill above the bottom of the cell?

22. What is the maximum square footage that will be exposed and not covered at any one time during the operation of the monofill?

23. Has the site been evaluated for impacts that would occur from a large earthquake, including, but not limited to susceptibility to liquefaction, potential changes in hydrology, i.e. raised water levels, and impacts on the tire bale structure?

24. What is the fire preparedness plan for this site? What would be the impacts from a fire and how would you address them?

25. Based on the application material and information in the February 7, 2014 Munter report, staff has determined that a Core Area Conditional Use Permit is required, per the requirements of MSB 17.61. Page 3 of 14 of Munter's report states in part *"... it would be*

reasonable to assume that there will be a sufficient amount of waste accumulated to generate leachate that will exceed one or more drinking water Maximum Contaminant Levels." In addition the report states in part *",,,it is highly likely to result in measurable increases in contaminants beneath the facility and for some distance downgradient."* A Core Area Conditional Use Permit application form is attached for your use.

26. Staff is currently researching whether or not the tire bale walls and monofill constitute a structure and are subject to the setback requirements in MSB 17.55 – Setbacks. We will forward our determination to you as soon as it is complete.

Once this information has been submitted and determined to be complete, the public hearing will be scheduled. Should you have any questions or require additional information please contact me at the above address, phone# 861-7862 or e-mail: slee@matsugov.us.

Sincerely,

Susan Lee

Palmer, AK 99645-6488

Re: Review of an application for a Conditional Use Permit for a proposed monofill near Palmer, Alaska

Dear Ms. Lee:

This letter is to provide the findings of my recent review of the application by Central Recycling Services and supporting documents related to a proposed monofill consisting primarily of shredded construction and demolition (C & D) waste near Palmer, Alaska.

A key part of the application packet is a report by Maddox and Associates, Inc (M & A) entitled Evaluation of proposed Palmer monofill with respect to potential impact on groundwater" dated December 13, 2013.

Since the application relies heavily on the findings of this report, it is reviewed first, followed by comments on the main application.

I. Review of: Evaluation of Proposed Palmer Monofill with Respect to Potential Effect on Groundwater by Maddox and Associates, Inc., Murrieta CA, December 13, 2013.

Page 1-3 Executive Summary

The executive summary contains information that repeats information found elsewhere in the report, and is not separately reviewed here.

Page 3 Introduction
While Maddox and Associates, Inc. (M &A) reports "working in all regions of the United States and in Canada", there is no specific mention of having worked in Alaska. Subsequent portions of the report seem to indicate a lack of familiarity with Alaska conditions (see p. 6 of this review). The summary of work performed does not contain any mention of a site visit.

Section 2.2 Site Conceptual Model
The site conceptual model in this report does not comply with Alaska guidance and normal use in Alaska of site conceptual models (see, for example, http://dec.alaska.gov/spar/csp/guidance/FINAL%20CSM%20Guidance%20MASTER%20Nov%202010.pdf). In particular, site conceptual models should not be used to quantify or assess health or environmental risk, only to identify pathways and potential receptors and exposures.

Page 4. Last paragraph
This paragraph provides a reasonable definition of inert waste as it seems to be commonly used in the solid waste disposal industry. The term, "inert", as used in this context, however should not be confused with the more common usage of the term as meaning "not chemically reactive" or, perhaps more importantly, soluble in water. For example, drywall is comprised mainly of the mineral gypsum, which is essentially calcium sulfate. When exposed to water, gypsum dissolves into the ions calcium and sulfate. This is the most likely source of elevated sulfate levels found in monofill leachate. The leachability tests conducted on waste for this project, for example, found sulfate levels of 520 to 673 mg/L, compared to the secondary drinking water standard of 250 mg/L.

Other materials disposed of at "inert" monofills will also eventually rot, decay, and leach constituents into groundwater. At least 27 states now require groundwater monitoring from such landfills, in increasing recognition of their potential to contaminate groundwater.

Studies have shown increased concentrations of some contaminants from C & D landfills. A study conducted for the U.S. EPA in 1995, for example, (ICF Incorporated, 1995) found groundwater contaminants that exceeded primary or secondary Maximum Contaminant Levels (MCLs) for drinking water at 11 C & D landfills. Potential contaminants from the proposed facility include sulfate, iron, manganese, total dissolved solids, arsenic and other metals, and organic compounds.

A more thorough and recent study of leachate from 30 Construction and Demolition Debris (C & DD) landfills in Ohio (Ohio, 2009) found the following conclusions:

> Ohio C&DD leachate contains a wide variety of inorganic parameters including heavy metals, light metals, trace elements, and other ions. It also contains a wide variety of organic parameters including pesticides, chlorinated solvents, non-chlorinated solvents, gasoline, substituted benzenes, phenolics, chlorofluorocarbons, polycyclic aromatic hydrocarbons (PAHs), phthalates, substituted alkanes, and alcohol.
>
> The leachate from all 30 C&DD landfills had from 3 to 29 parameters with concentrations that exceeded health based standards, surface water quality standards, or both. The median was 12.5 parameters exceeding the standards. The leachate from 29 of the 30 C&DD landfills had eight or more parameters that exceeded the standards.
>
> The wide variety of parameters detected in C&DD leachate, the wide variation in the number of parameters that exceeded health based standards and surface water quality standards in C&DD leachate and the magnitude of the exceedances are evidence that C&DD is not harmless or inert.

Many of the wastes proposed for the monofill, including wood, drywall, carpet, and probably even tire bales are not geologically stable in the Palmer area. Waste breakdown will inevitably result in dissolution and entrainment of waste constituents in leachate if water flows through the waste.

While the proposed monofill proposes to exclude "Hazardous Waste", it is not clear what this means, and in particular, that all waste that may be hazardous to water supplies will be excluded. For example, it appears that treated lumber containing compounds or elements known to be hazardous to human health appear to be allowable in the waste stream. The application does not address whether materials from buildings demolished as a result of building fires will be disposed at the facilities. Building fires are known to create compounds adverse to public health.

The term "Hazardous Waste" has numerous technical definitions that stem from the numerous laws and regulations that govern them. In this case, there will be a reliance on pre-demolition "Hazardous Building Material Surveys" and the proper exclusion of items described therein. The existence, thoroughness, and accuracy of these surveys is therefore important to the process, however it is difficult for the Borough to know or be assured that all materials that are potentially hazardous are appropriately excluded.

An important aspect of water contamination is that only a small amount of some compounds or elements are needed to contaminate a large volume of water. Arsenic, for example, has a drinking water primary MCL of 10 µg/L, or approximately 1 part in 100 million. The waste will be shredded, thus making for a relatively large surface area of waste in contact with percolating waters. It is not unreasonable to expect that even small percentages of leachable wastes in the 2 million cubic yards of waste will result in measurable quantities of contamination.

Considering that the proposed facility has a planned capacity of 2 million cubic yards of material and will have a service life of over 25 years, it would be reasonable to assume that there will be a sufficient amount of waste accumulated to generate leachate that will exceed one or more drinking water Maximum Contaminant Levels.

There are no significant barriers to the migration of this leachate into groundwater and it is highly likely to result in measurable increases in contaminants beneath the facility and for some distance downgradient.

Page 5 Paragraph 2

The seasonal high groundwater level has not been determined at this site. Review of the groundwater data and design drawings do not establish where the base of the waste will be in absolute elevation terms. The report fails to show that the bottom of the waste will stay dry during high water events.

Page 5 Paragraph 3

The description of secondary MCLs is somewhat simplified and misleading, at least with regard to sulfate. Sulfate was detected in three leachate samples from CRS at levels ranging from 520 to 673 mg/L. The secondary MCL for sulfate is 250 mg/L, based largely on the fact that elevated sulfate levels have a laxative effect. At levels up to about 600 mg/L, humans generally can adjust to this effect (Rowden, 2008). At levels above 600 mg/L, because of the laxative effect and effects on taste, it is an over-simplification and misleading to characterize such effects as "cosmetic" or "aesthetic". Background levels of sulfate in groundwater in the Palmer area are generally less than 50 mg/L, so local residents would not be expected to be adapted to high sulfate levels. So, if local wells were contaminated at levels between 250 and 600 mg/L,

homeowners could be in the awkward position of advising guests to not drink the water in order to avoid laxative effects, even if the residents themselves had adjusted to the effect. Home treatment systems to reduce sulfate levels would probably require a membrane filter technology such as reverse osmosis, which can be expensive to install, maintain and operate.

Page 5 Paragraph 5
The opinion that "it is not likely that a significant volume of liquids will pass through the monofill bottom into the water table" is not considered reliable as discussed subsequently in this review.

Page 5 Paragraph 6
Modeling analysis and results are reviewed in a subsequent section of this review. There is no evidence that the modeling results have been or will be used to "determine the proper location of guard wells". The monitoring plan included in the packet was written in the spring of 2013, well before the modeling studies were performed. Also, the well locations shown in the plan would not intersect the leachate plumes modeled. See further comments later in this review about monitoring.

Page 6 Paragraph 1
The following paragraph is not adequately supported by the analysis presented:

> The SCM indicates that the construction and operation of the proposed monofill is not likely to have a detrimental impact on the groundwater beneath or down gradient of the site

Furthermore, the normal Site Conceptual Model purpose of identifying potential pathways and receptors appears to have been subverted by premature dismissal of a likely pathway – that of contaminant migration to groundwater. The CSM also does not address potential impacts to surface water downgradient of the proposed monofill.

Page 7 Paragraph 2
The ADEC permit is not attached. The ADEC information attached identifies substances that may be prohibited from being disposed in the monofill, but there does not appear to be a list of materials that are allowed.

Page 7 Paragraph 4
This paragraph states that water levels have been measured over four seasons and that the seasonal high groundwater table has been determined. If this information has been collected, it has not been provided. The water-table map was constructed based on water levels measured on July 1, 2013, which is known to not be when peak water levels generally occur in this part of Alaska. Peak water levels typically occur during spring, after snowmelt, or in late fall.

Page 7 Paragraph 9
The following statement is, at a minimum, unclear and is also misleading.

> Where present, such grades will greatly facilitate the flow of precipitation from the monofill surface, thus significantly reducing the amount of infiltration into the refuse.

The grades referred to, of 50% and 33%, are clearly designed only for the sideslopes of the final fill structure which are only approximately one quarter or so of the surface area of fill. Approximately three quarters of the fill area is designed with a relatively flat final cap (with a finished grade of 2% to 3%), which will be very conducive to groundwater recharge and downward percolation through the waste. The nearly flat top surface of the monofill is illustrated graphically in figure 3-2 of the M &A report. It is misleading to suggest that the small area of steep slopes around the perimeter will "greatly facilitate" runoff from the "monofill surface", without noting the larger area of almost flat surface.

Page 10 Paragraph 1
This section does not address changes in water levels caused by gravel mining. Historical information and analyses (Munter (2010) and the water table map all illustrate that the creation of dredge ponds or dewatering activities can have a significant influence on water levels in the unconfined aquifer. In addition to natural seasonal fluctuations, the possibility of water level changes caused by future gravel mining or dewatering should be addressed.

Page 13 Paragraph 5
The direct comparison of pond water to City of Palmer drinking water is not appropriate because public water systems such as at Palmer are required to complete a broader panel of water quality tests prior to use of the system. There are no data to show that the pond water would meet those additional tests. The comparison to Alaska Drinking Water Standards is appropriate only for the parameters tested, not a blanket statement that the pond water "does not exceed Alaska Drinking Water Standards."

Page 14 Paragraph 2
It is not likely that the three samples of shredded material are representative of the entire volume of fill to eventually fill the 35.5 acre site. There is no information on the sampling technique (random, composite, etc.) or the sample size, compared to the individual particle size of the waste. Considering the diversity of materials allowed in the fill that are not reported to be part of the samples (carpet, treated lumber, semi-burned materials, etc.) or that may escape detection and end up in the fill, it is unlikely that the three samples accurately reflect the average composition of the fill. This limits the interpretive value of the data.

Page 14 Paragraph 3
The analytes do not encompass all of the water quality parameters that have been known to exceed water quality standards. Total Dissolved Solids is one example of a missing analyte.

The usefulness of the SPLP leaching test results is limited by the unusually high Limits of Quantitation (LOQs) reported by the lab (see appendix of report). Iron, for example, has a reported LOQ of 50 mg/L, compared to the water quality criteria of 0.3 mg/L. This means that if

Page 7 Paragraph 9

This limits the interpretive value of the data.

Page 14 Paragraph 3
The analytes do not encompass all of the water quality parameters that have been known to exceed water quality standards. Total Dissolved Solids is one example of a missing analyte.

The usefulness of the SPLP leaching test results is limited by the unusually high Limits of Quantitation (LOQs) reported by the lab (see appendix of report). Iron, for example, has a reported LOQ of 50 mg/L, compared to the water quality criteria of 0.3 mg/L. This means that if

iron levels were less than 50 mg/L, they were reported as not detected. So, while the sample results technically did not exceed the LOQs, the results cannot be interpreted as confirming that the samples did not exceed water qualitystandards other than those provided in Table 7.1. A similar situation exists for arsenic, which has an LOQ of 0.250 mg/L, compared to a drinking water standard of 0.010 mg/L. The cause for the high LOQs appears to be unusually high dilution factors used in the laboratory analyses. In summary, the SPLP tests did not produce results that demonstrate that the leachate generally meets primary water quality standards.

Page 15 Paragraph 1
Manganese and sulfate are noted to exceed secondary Drinking Water Standards in the leachate tests, which are described as non-enforceable guidelines, only affecting cosmetic or aesthetic characteristics of water. As previously described, the effects of sulfate may go well beyond cosmetic or aesthetic effects, and the history and reasons of why it is not regulated differently go beyond the scope of this review.

Sulfate is described as being not a "problematic constituent" by USEPA. This may be irrelevant to the Matanuska Susitna Borough because the drinking water standards used by EPA are applicable to public drinking water supplies. Private domestic wells in Alaska are left to local governments to regulate or not. In Anchorage, for example, while all public water supplies are required to meet a standard for nitrates of 10 mg/L, the Municipality of Anchorage will issue a Certificate of On-Site Adequacy (i.e. the well is "approved") for wells with water containing concentrations of nitrates over the 10 mg/L limit applicable to public water systems.

In this situation, if the MSB decides, after an appropriate decision-making process, that sulfate levels are important to local well owners, then it would not seem to make any difference what the USEPA thinks is suitable for public water systems.

Section 7.1.1, Pages 15-17
The ICF Incorporated study reportedly identifies 24 parameters from C & D leachate samples from numerous facilities that exceeded water quality parameters at least one time. The Ohio study notes that C & D leachate is not expected to meet water quality standards for discharge to groundwater. The Wyoming memorandum mainly seems to be saying that C & D leachate is not as bad as that from regular landfills. Take-away messages from these three studies seem to be that C & D leachate should be considered a pollutant, this pollutant should be expected from C & D landfills that generate leachate, and that good management practices can be helpful in reducing the impact of the leachate.

It seems that there could be some parallels between the regulation of C & D landfills and septic systems. Even properly designed and operating septic systems, for example, are known to release effluent that exceeds drinking water standards for one or more constituents. One of the principal successful tools for managing septic systems is through mandatory separation distances to drinking water wells. Septic systems continue to be popular because: 1) they are inexpensive compared to other options; 2) they are effective in treating household waste for long periods of time: and 3) they have been shown generally not to result in groundwater contamination most of the time.

The M & A report essentially makes the case that the leachate from the proposed monofill, while modestly exceeding water quality standards, would be sufficiently diluted prior to reaching offsite water wells or surface water receptors such that it would not be a problem. This brings up the concept of a separation distance to surrounding wells or receptors. The current ADEC permit for Alaska Demolitions C & D landfill, for example requires a 500-foot separation distance to surrounding wells. (ADEC Solid Waste Disposal Permit SWZA004-14).

Section 7.2, Pages 17-20
This section contains numerous deficiencies, as detailed below.

Page 17 Paragraph 6
This paragraph erroneously states that the 15.49 inches of annual precipitation at Palmer occurs as rain. There seems to be an unawareness of local climate conditions. Nowhere in the report have I found the words "snow", "snowpack", or "snowmelt". Furthermore, there is no evidence to support the supposition that there is more surface runoff than infiltration. In contrast, Kikuchi (2013, Appendix C) used a deep percolation model to estimate that recharge is approximately three times the amount of surface runoff in this area.

M & A references a course from the Lund Institute of Technology in Sweden to conclude that "a fully-saturated soil becomes almost an impermeable layer". This may be true in the context of a high-intensity rainfall on a low-permeability soil, however it has practically no relevance to the proposed monofill. The final cap materials for this monofill will be local materials, primarily sand and gravel, overlain by a porous organic soil that will support a vegetative cover. Such well-drained soils should not be characterized as "almost impermeable", even if saturated. Also, most precipitation and snowmelt in the Palmer area does not occur as high intensity rainfall. It is more common to have long-duration, low-intensity rain that contribute significant amounts of water to groundwater recharge. Kikuchi (2013) reports that the "core area" of the Matanuska-Susitna Borough receives approximately 5 inches of annual groundwater recharge, demonstrating the prevalence and importance of groundwater recharge processes in the local area.

M &A suggests that compacting the fill will greatly reduce its capacity for infiltration. Consider the situation when the monofill is completely filled and closed. With a 2 percent slope on the top surface, water will infiltrate into the cover. The issue here is whether the compacted fill materials are permeable enough to transmit water vertically downward through the filled cells. There are no data provided on the permeability of the fill. Suppose 5 inches of rain infiltrates the surface and percolates down to the top layer of fill. Darcy's Law shows that the hydraulic conductivity for the fill needed to transmit 5 inches/yr of water downward at a uniform rate is only 0.001 ft/day. This value is typical of silt (Freeze and Cherry, 1979). Reviewing the results of geotechnical testing performed on the compacted fill (Attachment H of the Application packet), it is highly unlikely that the compacted fill would exhibit a hydraulic conductivity as low as 0.001 ft/day. Thus, it would be prudent to assume that the compacted fill has a sufficiently high hydraulic conductivity to pass all the water that infiltrates into the landfill cover and to allow it to percolate downward through the waste at the site.

M & A also suggests that the steep slopes at the site will promote runoff rather than infiltration. M & A fails to note however, that the vast majority of the completed fill structure will have an almost flat (2-3%) slope, which will be very conducive to promoting groundwater recharge. To illustrate this, for example, the application packet suggests that the completed structure may be suitable for agriculture, park lands, or sports fields.

M & A compares the climate of Palmer to that of Los Angeles, California, and describes both as semiarid and "without significant annual precipitation". This assessment is incorrect. Climate classification schemes also use potential evapotranspiration and temperature regimes to classify climates. Palmer has much lower average annual temperatures and much lower potential evapotranspiration rate than Los Angeles. Kikuchi (2013) classifies the climate at Palmer as transitional between maritime and continental. There is significant annual precipitation in the Palmer area. It is sufficient to support mature deciduous and coniferous forest, hundreds if not thousands of household water-supply wells, numerous municipal and irrigation wells, non-irrigated agriculture, perennial flows in numerous streams and rivers, and many stable lakes. All these water uses are supported by annual precipitation without causing any significant net long-term change in groundwater storage (as noted by M & A).

M &A describes a cyclic infiltration process characterized by short periods of intense rain followed by evapotranspiration and drying out of surficial materials. This model may apply some places, but is not suitable for the proposed monofill.

According to a weather summary for Palmer, rain is usually not intense (http://weatherspark.com/averages/32899/Palmer-Alaska-United-States):

> "Over the entire year, the most common forms of precipitation are light rain and light snow.
>
> *Light rain* is the most severe precipitation observed during 46% of those days with precipitation. It is most likely around August 9, when it is observed during 37% of all days."

Furthermore, recharge processes in the spring and fall occur at times when evapotranspiration is low to very low and the soils and fill at the site are expected to be sufficiently well-drained that they can readily absorb relatively large quantities snowmelt and precipitation. There is no presentation of data to support M & A's infiltration scenario and it should not be relied upon.

M & A summarizes this section with the following major conclusion:

> "...it is likely that none of the precipitation will make its way through the considerable thickness of the proposed monofill. It follows, then, that it is unlikely that any of the monofill constituents will leach into the water table."

This conclusion is not supported by data or sound analysis and I do not concur for the reasons cited above. The thickness of the monofill is largely irrelevant. If water enters the top of the structure, it will percolate down and eventually exit. Water that goes in must come out.

Kikuchi (2013, Appendix C) tabulates modeled values of groundwater recharge in the vicinity of the proposed monofill. While most of the core area of the Borough has around 5 inches of annual recharge, the area around the proposed monofill (the lower Matanuska river area) is shown as receiving an average of 1.4 inches per year. A detailed review of this calculation (Kikuchi, 2014, written communication) shows that the mean annual precipitation at MAES (the Palmer Agriculture Station) during 2002-2010 (the period selected for recharge modeling) was 14.8 inches. However, the mean annual precipitation at Palmer Airport during 2002-2010 was 10.2 inches. The DPM model calculates daily precipitation at the centroid of each Hydrologic Response Unit (MRU) using an inverse distance squared weighting. The relatively low annual precipitation (11.09 in/yr) for Outlet Matanuska River HRU (190204020709) is due to the relatively low annual precipitation at Palmer Airport.

Further analyses has shown that the long-term average precipitation at the Palmer Airport is 11.89 in/yr (http://average-rainfall.weatherdb.com/l/19817/Palmer-Alaska) rather than the 10.2 in/yr modeled by Kikuchi (2013). This means that the likely recharge near the proposed monofill is likely higher than the 1.4 inches/yr modeled.

Considering annual variations and long term averages, therefore, annual groundwater recharge at the location of the proposed monofill is likely to be in the range of 1-5 inches per year. For a 30-acre surface area at the top of the fill structure, this translates to approximately 800,000 – 4 million gallons per year. This is also the amount of water that is expected to flow through the fill material and enter the water table beneath the site as leachate.

Section 7.3, Pages 20-21

This analysis probably overestimates the amount of groundwater passing beneath the site. The value of transmissivity of 100,000 ft^2/d is applicable to areas where the thickness of the aquifer is about 200 ft, which is generally somewhat north and east of the proposed monofill site. The aquifer appears to be somewhat thinner at the proposed site, only about 120 ft. The Darcy's law calculation should have assumed a relatively constant value of hydraulic conductivity similar to that estimated for other areas, of 500 ft/day. This would reflect an assumption that the aquifer materials do not change significantly across the area, only the aquifer thickness varies. Using the lower value of hydraulic conductivity of 500 ft/day, the estimated groundwater flow quantity beneath the site would be approximately 4.0 million gallons per day.

Section 8.0 Groundwater Modeling, Pages 21-25, including figures

The model presents several relatively straightforward hypothetical scenarios of contaminant fate and transport. The results are consistent with what is generally known about this site and with contaminant behavior in these types of flow systems. While the results show that concentrations of all the hypothetical contaminants would be greatly reduced, all of them are shown to persist at values greater than the respective Maximum Contaminant Levels (MCLs) for each constituent (Benzene = 5 µg/L, PCE = 5 µg/L and 1,2-DCE = 70 µg/L). Thus, the modeling shows that domestic drinking water wells could be contaminated even at distances of about a mile from the proposed monofill.

The modeling is also based on a slug input of hypothetical contaminants, which might apply to a spill or leak of a finite amount of contaminant. If there is a persistent source of contaminant such

as sometimes emanates from landfills, the plumes would not detach from the source area and long continuous plumes would tend to form from the source to the leading edge of the plume.

Another limitation of the model is that the flow field is extrapolated from hydrogeologic data collected only from the proposed site of the monofill and does not incorporate any data from downgradient areas. As hydrogeologic conditions commonly change over the distances of a mile or more, the actual conditions and fate and transport results in a downgradient direction may be different than those modeled.

The modeling conclusion that the contaminants "will essentially cease to be present in detectable concentration after only a short transport distance beyond the monofill boundaries" is incorrect and unreliable. The laboratory analyses for the three compounds measured had unusually high detection limits as a result of high dilution factors of up to 200 used in the analyses. Groundwater samples from monitoring wells do not usually have such large dilution factors, and detection limits are much lower. Benzene, for example, had an LOQ (essentially a detection limit) of 80 micrograms/liter for Residual A, however the LOQ for the sample blank used for quality assurance purposes had an LOQ of only 0.400 micrograms/liter. Recall that the MCL for benzene is 5 micrograms/liter. Thus, since groundwater monitoring samples routinely have detection limits much lower than those used in the leachate tests, the modeling fails to demonstrate that contaminant concentrations will be below detection limits or any applicable water quality standards.

Finally, such a modeling exercise may be useful for planning permit conditions for the proposed monofill. As previously noted, separation distances between the monofill and surrounding drinking watr wells may be appropriate conditions for approval of the facility. Unfortunately, there is no information provided as to the locations of surrounding wells, so planning appropriate separation distances is challenging.

The reliability of the model would be improved by obtaining and incorporating data from the groundwater flow field downgradient of the facility.

Guard Wells, Page 26
It is not clear what guard wells are contemplated. The groundwater monitoring plan was prepared prior to the modeling study and recommends only three monitoring wells, two on the west side of the fill and one upgradient. None of the proposed plan wells are located in places that would have detected any of the plumes shown in the groundwater modeling effort. The wells installed in 2013 appear to be located in areas that will be filled, so the long term use of those wells appears doubtful. Thus, it appears that the existing and/or proposed monitoring wells will be ineffective at detecting contaminants leaving the proposed monofill.

Section 9.0 Conclusions Page 26-28
There are 17 bulleted conclusions, followed by a brief concluding paragraph. For convenience, the bullets are numbered according to sequence.

Bullet 1. The site conceptual model does not provide sufficient data and analysis to adequately support this conclusion.

Bullet 2. Substantially agree, except that man-caused changes in water levels related to potential future gravel operations should be considered.

Bullet 3. Disagree. Groundwater occurs at depths of less than 10 ft beneath the current land surface, however design of the facility requires regrading to occur to create a 10-ft buffer prior to depositing waste. Recommend further analysis of seasonal high water table elevations and inspection prior to depositing waste to confirm bottom elevation of the site relative to an updated high-water table map.

Bullet 4. Disagree. Most likely closer to 4,000,000 gallons/day.

Bullet 5. Agree.

Bullet 6. Agree.

Bullet 7. Detection limits (LOQs) were far in excess of Maximum Contaminant Levels, meaning that non-detects cannot be used to rule out the presence of contaminants above MCLs. It is highly questionable that only three samples are representative of the future waste pile.

Bullet 8. It is not clear what the criteria of "properly evaluated' and "properly managed" mean. In the absence of greater clarification, it is not proper to conclude that the site meets these criteria. In particular, there is no information presented about private wells or surface water bodies in actual or potential downgradient directions and no comprehensive groundwater monitoring plan to assure protection of those wells. Lacking these details, "properly managed" could mean almost anything, including prohibition of the use of water wells for up to a mile in a downgradient direction in the absence of a more robust monitoring program and an action-plan to deal with exceedances.

Bullets 9, 10, 11, 12, 13, 14, and 15. Precipitation at the site is probably in the range of 12-15 inches/yr and infiltration is likely lower in the winter than in the summer. The remainder of these bullet points, however, are generally not supported with data and contain inaccuracies. It should be expected that 800,000 to 4 million gallons per year of water from precipitation and snowmelt will infiltrate and percolate through the waste and this fluid will become leachate that will recharge the water table both during operations and during the post-closure period far into the future. The leachate should be expected to exceed multiple water quality standards applicable to drinking water wells.

Bullets 16 and 17. These conclusions fail to note that all three contaminants could travel approximately a mile downgradient and still exceed drinking water standards, even after experiencing the modeled reductions in concentration.

Concluding Paragraph. The conclusion that the proposed facility "will not pose a threat to the underlying aquifer" is not sufficiently supported by data or analysis and should not be relied upon.

II. COMMENTS ON APPLICATION AND OTHER ATTACHMENTS

The cover letter suggests that this packet addresses the concerns expressed regarding the previous application. As detailed above, the hydrogeologic studies, monitoring plans, and inventory of surrounding wells are inadequate. The letter also states that they have obtained ADEC approval of the design. This contrasts with my understanding that a permit for this facility has not yet been granted by ADEC.

In response to the question: Will the granting of the conditional use permit be harmful to the public health, safety, convenience and welfare? (Page 1 of 3 of the MSB CUP application), the applicant answered "yes". It is not clear that this was the intent of the applicant.

The map showing adjoining property types on page 11 does not extend far enough to the south and west to show the existing land uses within the one-mile downgradient groundwater flow field described by the groundwater modeling. Other work (Munter (2010)) indicates that there are residential wells and property in this area.

The application (p. 16) relies on the report by Maddox and Associates to conclude that the "proposed monofill will not present a threat to groundwater…". As detailed above, this opinion is not sufficiently supported to be reliable.

The application (p. 16) also proposes a groundwater monitoring plan to "monitor the groundwater for any concerns long term". The monitoring plan presented does not achieve that objective. Following are samples of some concerns that are not adequately addressed:

1. What is the plan for long-term monitoring well locations, considering that some of the existing wells are in locations that apparently will be buried by fill material?

2. There are an insufficient number of wells to monitor a potential groundwater plume, considering its potential breadth (over 1000 ft wide) and complexity.

3. How will groundwater be monitored in the aquifer up to one mile downgradient of the facility that is vulnerable to contamination?

4. How will the identification of contaminated groundwater affect operations or management of the site? Who will pay for removal of the disposed material, installation of an impermeable cap, or other actions that may be needed to clean up groundwater? Who will pay for treatment systems or alternate water supplies for private well owners who may have their wells contaminated from the facility?

5. At what level, if any, will exceedance of secondary water quality standards be regarded as unacceptable? For example, an ADEC fact sheet indicates that the relevant standard for sulfate in groundwater may be natural background concentrations. (Water Quality Standards for Assessment Monitoring of Groundwater accessed at: http://dec.alaska.gov/eh/docs/sw/Monitoring/Water_Quality_Standards_Groundawter.pdf)

The leachate tests performed on sample waste material almost assure that groundwater contamination will result, if this is the applicable standard.

6. What agency will review and potentially act on groundwater monitoring results?

Comparisons to findings at other landfills in Alaska (p. 15-16) that report minimal or no environmental or public health problems are of limited value to this project. This is because of potentially large differences in geological conditions and down-gradient receptors. For example, there may be no water wells in use downgradient of the other landfills reported. The other landfills may not be situated on top of an extensive, thick, and permeable water-table aquifer.

The monitoring wells (p. 28) were installed between April 22-24, 2013. Reporting that they have been "measured over the last year" is somewhat inaccurate. The only water-table map in the packet is based on water-level measurements made on July 1, 2013, and these measurements should not have been used to determine the seasonal high water table and the base elevation of the fill. Approximately monthly measurements for a period of a full year should be used to define the peak water table, and that should be used to define the 10 feet of separation required to the base of the fill.

Below are the general standards that appear to be applicable to this site from the MSB website:

> **17.60.100 GENERAL STANDARDS.**
>
> (A) A conditional use may be approved only if it meets with the requirements of this section in addition to any other standards required by this chapter.
>
> (B) In granting a conditional use permit, the planning commission must make the following findings:
>
> (1) the conditional use will preserve or not detract from the value, character, and integrity of the surrounding area;
>
> (2) that granting the conditional use permit will not be harmful to the public health, safety, convenience, and welfare;
>
> (3) that sufficient setback, lot area, buffers, or other safeguards are being provided to meet the conditions listed in subsections (B)(1) through (3) of this section; and
>
> (4) the conditional use fulfills all other requirements of this chapter pertaining to the conditional use in this section.

The Maddox and Associates report fails to present sufficient data and sound analysis to support their conclusion that the proposed use of the site does not present a threat to groundwater. Insufficient data and analysis have been provided to accurately evaluate the effects of the proposed monofill.

Should you have any questions about this review, please call me at 345-0165 or 727-6310.

Sincerely,
J. A. Munter Consulting, Inc.

Attachments: 2009-4-23 SWZA004-14 Palmer Inert - AK Demo.pdf

Susan,

We do not have a draft permit, as the application has been on hold. We had reviewed the application and determined that it met the requirements for an inert waste monofill, and had posted a public notice. However, if they make even minor changes to the plan, the must submit a new application, including posting another public notice. At this point, the permit would likely include any stipulations required by the conditional use permit as well as others initiated by ADEC.

Attached is the permit for the Alaska Demolition Palmer Inert Waste Monofill.

Please call or email if you have any additional questions.

Thanks,
Lori

Subject: Central Monofill Services

Hi Lori:

I am processing the conditional use permit for Central Monofill Services proposed monofill outside of Palmer. I know the ADEC permit was not issued since the MSB permit was not approved. However, I was wondering if there is a draft permit that I could review. CMS's application material states that " ADEC reviewed the CMS Monofill Permit application for this site and has approved the permit conditioned upon receipt of the MSB CUP".

In addition, could you send me a copy of the Alaska Demolition permit for their operation in Palmer.

If you have any questions or need additional information please let me know.

Susan

APPLICATION FOR A CORE AREA CONDITIONAL USE PERMIT – MSB 17.61

Carefully read instructions and applicable borough code. Fill out forms completely. Attach information as needed. Incomplete applications will not be processed.

Application fee must be attached:
_____ **$500 for Core Area Conditional Use Permit**

Prior to the public hearing, the applicant must also pay the mailing and advertising fees associated with the application. Applicants will be provided with a statement of advertising and mailing charges. Payment must be made prior to the application presentation before the Borough Planning Commission.

Required Application Information	**Attached**
1. Written detailed description of the proposed project	
2. Copy of the local covenants	
3. Copies of any current report on hazardous substances or hazardous waste prepared for submittal to state or federal agencies, and expected types and quantities of combustible fiber to be stored or combustible dust to be produced	

Nonconforming Uses and Structures	Yes	No	Attached
1. Is this an expansion of a pre-existing legal nonconforming use or structure?			
2. If yes, has the nonconforming use been discontinued for more than 12 consecutive months since January 1, 2003?			
3. Describe the proposed expansion/increase of the pre-existing legal nonconforming use.			
4. To establish pre-existing legal nonconforming rights for a use, complete this form (including attachments). Also include a copy of the 2003 Business Licenses for the use and evidence of the continued existence of the use at this site since January 1, 2003?			

SITE PLAN – Attach a detailed site plan, drawn to scale, showing the following information:	Attached
1. Setback distances of structure(s) from the lot lines, rights-of-way, and waterbodies.	
2. Adjacent streets, pubic easements and rights-of-way	
3. Existing and proposed buildings and structures (including tanks and chemical processing equipment)	
4. Access points	
5. Buffering – Visual and Sound	
6. Vehicular and pedestrian circulation patterns	
7. Location and dimensions of parking areas to be provided, including individual parking spaces	
8. Loading areas	
9. Storage and processing areas	
10. Lighting	
11. Topography	
12. Drainage management plan	
13. Sources of noise	
14. Fences	
15. Berms	
16. Landscaping	
17. Signage	
18. Scale and North Arrow	

DIMENSIONAL DRAWING(S) – Attach a dimensional drawing of the horizontal views of the structure(s), drawn to scale, showing the following information: ***(*If more than one structure is proposed, attach requested information about each.)***	**Attached**
1. Dimensions of all structures	
2. Appearance	
3. Modifications	
4. Identification of use areas with locations and dimensions	
5. Delineate areas of expansion or change in use	
6. Other details sufficient to adjudicate the application	
7. Scale and North Arrow	

NOISE	**Yes**	**No**	**Attached**
1. Will the use generate noise beyond the project site lot lines exceeding Maximum Permissible sound levels shown in the Table below?			
2. Are **any** of the sounds exceeding permissible levels **generated by source(s) that are exempt from regulations under MSB 17.61.080(C)?** ***If yes, attach a detailed description of source and levels and days and times of day the levels will be exceeded by exempt generators.***			
3. **Are all of the sounds exceeding permissible levels generated by source(s) that are exempt from regulations under MSB 17.61.080(C)?** ***If no, attach a detailed description of source and levels and days and times of day the levels will be exceeded by regulated generators.***			

Maximum Permissible A-weighted Sound levels (MSB 17.61.080)

Land Use of Sound Source	Land Use of Adjacent Property				
	Residential			Commercial	Industrial
	Day	Night			
	Monday through Friday 7 a.m. to 10 p.m. or 9 a.m. to 10 p.m. on weekends	Monday through Friday 10 p.m. to 7 a.m.	Weekend **10 p.m. to 9 a.m.**		
Commercial	60dB(A)	50dB(A)	50dB(A)	70dB(A)	75dB(A)
Industrial	60dB(A)	50dB(A)	50dB(A)	70dB(A)	80dB(A)

TRAFFIC GENERATION	Yes	No	Attached
1. Is the Traffic Impact Worksheet attached?			
2. Will the use generate traffic in excess of 100 vehicles during the morning or afternoon peak hour? *If yes, attach a detailed description of the type of vehicles and schedule.*			
3. Will the use generate a total of more than 750 vehicles per day (12 a.m. to 12 p.m.)? *If yes, attach a detailed description of the type of vehicles and schedule.*			
4. If the trip generation rates estimated on the Traffic Impact Worksheet exceed the volumes described in MSB 17.61.020(A)(2) a Traffic Impact Analysis (TIA) and management plan for traffic, parking, and loading, demonstrating compliance with MSB 17.61.090 must be attached with the application.			

HAZARDOUS MATERIAL	Yes	No	Attached
1. Will the use process, manufacture, or store hazardous substances over threshold established by federal or state community right-of-know laws and regulations (40 CFR 370; AS 29.35.500)?			
2. Will the use at any time generate combustible dust in sufficient quantity to produce an explosion or combustion hazard?			
3. Will the use store or handle combustible fiber in quantities greater than 100 cubic feet (2.8 m^3)?			
4. Will the use generate or manage more than 2,200 pounds of hazardous waste per month as defined by federal regulations (40 CFR 261, 262)? *If yes, attach a detailed description of the type, quantity, schedule, and use of the hazardous material demonstrating compliance with MSB 17.61.090.*			
5. Are <u>any</u> of the Hazardous Materials exceeding the regulated thresholds originating from use(s) that are exempt from regulations under MSB 17.61.100(B) and (C)? *If yes, attach a detailed description of the type, quantity, schedule, and use of the hazardous material, and the specific code that authorizes the exemption(s).*			
6. Are <u>all</u> of the Hazardous Materials exceeding the regulated thresholds originating from use(s) that are exempt from regulations under MSB 17.61.100(B) and (C)?			

DRAINAGE AND RUNOFF	Yes	No	Attached
Will the use generate contaminated water runoff or other discharges that are likely to violate state water quality standards or negatively impact groundwater or surface water quality beyond adjacent property lines? *If yes, attach a detailed description of type, quantity, source, and management plan to prevent violation of state water quality standards and negative impact to groundwater and surface water quality.*			

In order to grant a conditional use permit under MSB 17.61, the Planning Commission must find that each of the following requirements has been met. Explain the following:	**Attached**
1. Will the conditional use preserve and not detract from the value, character and integrity of the surrounding area?	
2. Will the granting of the conditional use permit be harmful to the health, safety, convenience or general welfare of the public?	
3. Are sufficient setbacks, lot area, buffers, or other safeguards being provided?	
4. Will the proposed use, even with mitigation, be incompatible with and adversely affect surrounding residential neighborhoods?	
5. Will the proposed use adversely affect property values of surrounding areas?	
6. Will the proposed use create unreasonable noise levels beyond the property lines of the proposed location?	
7. Will the proposed use adversely affect the safe and efficient flow of traffic on any highway, arterial, collector, or street from which access to and from the business occurs?	
8. Are there adequate off-street parking facilities to accommodate a reasonably expected increased demand for parking generated by the business?	
9. What measures are being proposed to reduce any negative effect upon adjacent properties by property line buffers and roadway buffers, berms, landscaping, clustering with other similar uses, and where the surrounding area is predominantly residential in character, whether the site and building design features contribute to the residential character of the surrounding development?	
10. Are the proposed site plans and plan of operations consistent with the purposes of MSB Chapter 17.61?	

OWNER'S STATEMENT: I am owner of the following property:

MSB Tax parcel ID #(s) _____ and,
I hereby apply for approval a Core Area conditional use permit on that property as described in this application.

I understand all activity must be conducted in compliance with all applicable standards of MSB 17.61 and with all other applicable borough, state or federal laws.

I understand that other rules such as local, state and federal regulations, covenants, plat notes, and deed restrictions may be applicable and other permits or authorization may be required. I understand that the borough may also impose conditions and safeguards designed to protect the public's health, safety and welfare and ensure the compatibility of the use with other adjacent uses.

I understand that it is my responsibility to identify and comply with all applicable rules and conditions, covenants, plat notes, and deed restrictions, including changes that may occur in such requirements.

I understand that this permit and zoning status may transfer to subsequent owners of this land and that it is my responsibility to disclose the requirements of this status to the buyer when I sell the land.

I understand that changes from the approved conditional use permit may require further authorization by the Borough Planning Commission. I understand that failure to provide applicable documentation of compliance with approved requirements, or violation of such requirements will nullify legal status, and may result in penalties.

I grant permission for borough staff members to enter onto the property as needed to process this application and monitor compliance. Such access will at a minimum, be allowed when the activity is occurring and, with prior notice, at other times necessary to monitor compliance.

The information submitted in this application is accurate and complete to the best of my knowledge.

Subject: Tax Revenue Implications

Dear Alex, In reference to code ref. 17.60.030 in which the borough recognizes the potential damage to property values ect. around junkyard areas. Will or has the borough studied the potential impact to tax revenue losses if the CMS monofill is approved and surrounding property owners contest their appraisals. Studies show the impact on home values to reach up 1 mile around dump sites. This could have unintended consequences to the borough's tax revenues if approved.

Hi Susan,

Apparently things are happening with the Borough council, as I am getting a lot of phone calls. Can you direct me to where I can find all the Borough produced information on the monofill, so I can help delineate the Borough's issues from the State's issues – people are not accepting my answers that I cannot do much until I see what conditions the Borough might require.

Thanks,
Lori

Palmer, Alaska 99645
March 4,2014
Matanuska-Susitna Borough
350 East Dahlia Ave.
Palmer, Alaska 99645
Attn: Mayor Larry DeVilbiss
Dear Mayor Larry DeVilbiss,

I am writing to you with great respect and the position you hold as Mayor of the Matanuska-Susitna Borough, and I do believe in the same principals as you do.

" The Mat-Su Borough needs a strong and sustainable economy; which is obtainable through common-sense leadership." With that statement it bring up some of the mistakes the Borough has done in the past that has caused excess of amount spending such as the Ferry. Planning is a very import part of the economic growth, by building the Ferry before a deal to secure dockage was putting tax pay's money at risk and now we are paying the consequence.

"Open for Business" is your statement and we all understand the only way to grow is to develop. But in developing we need to attract the "Right Kind of Business" that will employee more than a hand full of people, Public safety and health and business that require Industrial locations to be placed in Industrial zoned areas.

I would like to bring to your attention to the CMS Monofill that is becoming a major issue for a lot of people. It's not to say we don't want businesses to be developing in the Mat-Su or "Palmer" but the Right Kind of Businesses. I sure you are well aware of the all the problems that are occurring and the hard ship on the people who choose to live in Palmer.

CMS is not a partner who I would say is on the "WIN WIN" side of things. Just look at the problems they have started, Anchorage Daily News Reports, "Recycler Sues City Over Disposal Discount for $100,000.00" (ADN 03/ 01/14), In Palmer Court they were found guilty in 6 citations for Illegal Dumping. I've been in business and my rule of thumb, is Strong Business Ethics, Trust, and a "Win Win Partnership." No matter what CMS promises and how they think they will take care of problems that arise, their records show it all.

Mr. Mayor I took the liberty to do some research to show you that this is a bad deal all based on how much the Borough will lose in taxable income. Taxable Income is a vital need to keep the Mat-Su Growing but if you start losing it, where will you find it to make it up, by Raising Taxes? Not good for someone in your position who wants to lower them. I went to the "Mat-Su Borough Parcel Viewer" to first see how many properties are located with in a one-mile area of CMS property boundaries. From my calculation there are 415 +/- private property owners, some with million dollar homes on them. My process, I took 5 random properties assessments from each subdivision (Canoe Lake, Crimson View and Sky Ranch). I worked out the loss of income that will generate if this Dump goes through. Based on the assessment tax for these 15 properties the loss will be from $270,126.00 to $675,315.00, not good. And not to mention the other loss of income to the Boroughs own land fill, CMS will be dumping tonnage on their on property to avoid paying it fair share.

You have the power to make the right choice to protect the Gateway of Palmer from the smell of Leaking Decomposing Gas (Same Smell at Highland Facility), Unsightly Trash, Contaminating Drinking Water and to the 415 property owners of Palmer who's hard earned investments that are at stake. None of this would have come to a head if the Borough enforced the "Reclamation clause in the gravel pit agreements."

Sincerely,
William Quantick

From: Aldrich, Lori (DEC) [lori.aldrich@alaska.gov]
Sent: Friday, March 07, 2014 3:51 PM
To: Shane Durand; Stuart Jacques
Subject: CMS MSB CUP Application

Shane and Stuart,

I was sent a copy of the Matanuska-Susitna Borough (MSB) Conditional Use Permit (CUP) Application. It included additional information that had not been previously submitted to ADEC. I did a brief review of the application. Although, this is not an official review of the application, I do have some comments regarding some of the language and information in the CUP application as it relates to the Inert Waste Monofill Permit Application submitted to ADEC.

CUP Application

Page 16 – These wells and monitoring plan are not required by ADEC but will allow CMS to monitor the groundwater for any concerns long term.

See comment below on Groundwater Monitoring Plan

Page 17 - Alaska Department of Environmental Conservation (ADEC) reviewed the CMS Monofill Permit application for this site and has approved the permit conditioned upon receipt of the MSB CUP.

ADEC has NOT APPROVED the permit – the permit application was deemed complete and a public notice was issued. ADEC also noted, in discussions with CMS, that if any significant changes were made to the permit application information in regard to the requirements of the Conditional Use Permit (CUP) issued by MSB a new complete ADEC monofill application would need to be submitted, including a new public comment period.

Page 28 - More than 70% of the existing monofill footprint is already in excess of 10' above the seasonal ground water table. Those areas with insufficient separation from ground water will be filled with onsite earthen materials to obtain a minimum separation of 10'.

The original permit application indicated that the low point of the monofill was more than 10 feet above the groundwater table. In discussions, CMS indicated that additional groundwater studies would be performed in May 2013 to determine the seasonal high groundwater levels, and the reports submitted to ADEC. The groundwater contours were developed from data collected on July 13, 2013, which would identify seasonal low groundwater levels. In addition, no discussion of fill to attain the proper groundwater separation was discussed. If areas are filled, you will need to resurvey the site and submit a new drawing of the present conditions.

Page 31 - The ADEC permit requires the owner to provide bonding or other financial assurance to cover the cost of monofill closure. The ADEC has a predetermined method for calculating the amount required for the bond or other financial assurance to make sure it is enough to cover all closure costs. CMS has met this obligation as part of the ADEC permit.

CMS has not presented adequate financial assurance to meet this requirement, and we would not expect CMS to submit this until ADEC had determined that a permit would be issued or denied. This will be based on a final review of the application and any other information gathered regarding the site conditions and facility plans.

Page 33 - ADEC has approved the proposed monofill design pending receipt of the MSB CUP.

ADEC has determined that the monofill design package is complete, but has not issued an approval for the design.

Maddox & Associates Report
Pg B-29 – states "the planned elevation of the bottom of the inert refuse in the monofill is a minimum of 10-feet below the normal seasonal high [water table].

Above, the CUP text indicates that this is not true, based on the ADEC monofill permit application, which does not include fill.

Groundwater Monitoring Plan

If CMS will be performing Groundwater monitoring at the site, a Groundwater Monitoring Plan that meets the conditions of 18 AAC 60.820-860 must be submitted to and approved by ADEC. This would be considered a significant change to the landfill operations.

RACM Cell

As I believe you were informed, the original Public Notice by ADEC did not include mention of the RACM cell. The only possible correction would be to issue an additional public notice if you will include a RACM cell at the monofill. I thought we had communicated to you and suggested that, if ADEC did permit the monofill, you might wait to begin a RACM cell at the site, and we could make the necessary permit modifications (including a public notice) at that time. In addition, we are somewhat concerned regarding comments on the wind issues at the site and our ability to permit RACM disposal.

If you have any questions or wish to discuss the comments, you can contact me after March 17. I will be out of the office in training all next week.

Thanks,
Lori

Subject: Central Monofill Services

Hi David & Melissa:

I am processing the conditional use permit for Central Monofill Services proposed monofill outside of Palmer. This morning I received a call from a member of the public, Zennon McNeill, regarding their project. I am looking for some clarification and/or additional information regarding the information that he relayed to me. He stated that DNR has given CMS a deadline of May 31, 2014 to stop the flow of water from the middle lake. He stated that DNR told CMS that they could apply for a permit (he did not say what type of permit), but that DNR would deny the permit. He also stated that DNR is conducting a hydrological study of the area and was monitoring the wells and lake levels in the area. He stated that the water table will be raised when the water flow is stopped.

Do you need a copy of the application material we have received from CMS for this project? Their application material contains a groundwater study that they had conducted for this project. We are waiting for additional information from them in order to process the application. I would appreciate it if you would let me know what their status is with DNR.

Thank you for your assistance.

Susan,
Thanks for the contact. I too had contact with Zennon today.

Here is a copy of the letter sent to Central Recycling Services on Sept 26, 2013. It gave the company until May 30 to have an engineered plan in to our office, and until August to stop the diversion.
There is an option for applying to DNR for a permit to divert the water, but since there are continuing complaints and legislative inquiries, at this point without significant additional information being presented, I doubt that I would issue a permit. The Alaska Hydrologic Survey (Melissa Hill and her staff) have been conducting some field investigation in the area. We would be happy to brief you on that process.

I would appreciate getting a copy of the entire "new" application package. We look forward to a review of those materials, including the "groundwater study" that they "had conducted".
We would also be interested in your request for additional information as well.

Please feel free to give me a call or e-mail at any time. I am the primary contact for this project.

Sincerely,
Dave

Attention: Mr. Stuart M. Jacques

RE: C. P. P. Dam (AK00401)

Dear Mr. Jacques:

As you are aware, the ADNR MLW/Water Resources section has been involved with ongoing issues related to the C.P.P Dam (Dam). This letter is a follow up to the meetings and discussions that our staff have had with Central Recycling Services staff concerning the Dam and diversion of water. In 2012, the Water Resources Section of the Alaska Department of Natural Resources (ADNR) approved an application from Granite Construction Company (Granite) for a *Certificate of Approval to Modify a Dam* for an artificial barrier to the flow of water between two gravel pits in Palmer, Alaska. Previously, this structure was determined to be under the jurisdiction of the Alaska dam safety regulations contained in Article 3 of 11 AAC 93. The barrier was named the C.P.P. Dam and assigned the National Inventory of Dams identification number AK00401. As indicated in the application, ADNR understood the purpose of the modification was to reduce the height of the "dam embankment" so that the Dam would no longer be within the definition of a state jurisdictional dam described in Alaska Statute (AS) 46.17.900 (3), while at the same time, maintaining the normal water level of the "Middle Pond." Based on historical observations, the normal water level of the Middle Pond was observed to be several feet higher than the adjacent pond to the west, referred to herein as the "West Pond."

The modification to said Dam was completed by Granite Construction Company in late 2012, and ADNR thereafter determined the modified structure no longer was a "jurisdictional" dam. In the spring of 2013, after the Middle Pond level recovered from the dam modification activities, a significant amount of flow was observed through the pore space in the rip rap lined spillway, and the Middle Pond water level appeared to be in the process of stabilizing at a level below the normal water level indicated in the approved design. ADNR, staff has estimated this flow rate through the pore space in the rip rap lined spillway on the order of 1000 gallons per minute (gpm), which is equivalent to 1.44 million gallons per day. As a result of this development, in July of 2013, your company installed a concrete barrier to the flow within the rip rap. Although this work appears to have reduced this flow to some degree, a significant amount of flow through the rip rap in the spillway downstream of the barrier continues to be easily observed.

An application for water right or application for temporary use of water was not submitted to ADNR during the application process for the *Certificate of Approval to Modify a Dam*. The Alaska Water Use Act (AS

46.15) requires a water right application or temporary water use application for the diversion of more than 500 gallons per day for more than ten days per calendar year. This equates to approximately 0.35 gpm. Installation of the barrier makes calculating an estimated flow more complex, but by observation, ADNR believes that the current diversion flow rate substantially exceeds 0.35 gpm. Consequently, ADNR requests that you improve the performance of the barrier to flow to reach a rate below the rate that requires an application, or apply for authorization to operate a diversion structure in accordance with Alaska Administrative Code Section 11 AAC 93.035. Because it is late in the construction season, ADNR requests that you apply for a permit to divert water or provide DNR with an engineered plan to stop the water diversion by May 30, 2014. This plan must include a timeline to accomplish the reduction in flow across the "dam" no later than August 31, 2014.

Further, please note that AS 46.15, and the 11 AAC 93.035 application requirements thereunder, also apply to any water use or diversion that may adversely affect the public interest. In the past and again in 2013, ADNR has received numerous complaints about high water levels in the nearby Canoe and Irene Lakes. Starting in 2006, ADNR began collecting water level data at those and other lakes in the area, including, with permission, the Middle and West Ponds at the gravel pits. ADNR now requests your permission to continue this monitoring until a technically sound understanding of the regional hydrogeology is developed. If you are willing to grant access, ADNR would like to install a temporary bench mark at a mutually convenient location and conduct monthly water level monitoring on your facility, as described in the attached permission request. Please sign and return this form if you are willing to grant this permission.

I want to thank you for your continued cooperation with ADNR as we seek to resolve this situation. If you would like to discuss this matter I can be reached at (907) 269-8645 or by cell (907) 230-6061. Further, please contact Melissa Hill, PhD, CPG at (907) 269-8646 in order to discuss establishing a benchmark and monitoring activities.

Sincerely,

M. Wall NRM II

for David W. Schade, MPA

Section Chief

Temporary Access and Monitoring Request

Introduction

The Department of Natural Resources is developing regional scale groundwater monitoring programs in the Mat-Su Valley, Anchorage Bowl, and Kenai Peninsula. The purpose for these programs is to gain a better understanding of available groundwater resources in these areas.

Why am I being contacted?

Success of the monitoring programs is highly dependent on the cooperation of businesses and homeowners granting staff from the Department of Natural Resources, Alaska Hydrologic Survey Unit temporary access to their property and well(s).

What do these programs involve?

The Alaska Hydrologic Survey is comprised of trained professional hydrologists. These professionals will measure lake level changes and well water depths on your property on a monthly basis. Alaska Hydrologic Survey staff will notify the property owner 24 to 48 hours before each site visit, which will take approximately 1 to 2 hours. The property owner is not required to be present for the site visit, which will occur on weekdays, during normal business hours 8:00 am to 5:00 pm. All data collected will be provided to the property owner free of charge.

What do I need to do to participate?

Participation in the program is voluntary and may be terminated at any time at the sole discretion of the participant.

Should you choose to participate in these important programs, the Department of Natural Resources, Alaska Hydrologic Survey Unit requests that you complete, sign and date the attached temporary access and monitoring agreement and return it, along with a copy of your well log[1] (should you have one available) to:

Alaska Hydrologic Survey
Attn: Dr. Hill
550 W. 7th Ave, Suite 1020
Anchorage, Alaska 99501

The Department of Natural Resources, Alaska Hydrologic Survey Unit thanks you for your cooperation and greatly appreciates your participation in these important projects.

[1]Well logs are requested as they will provide useful information for distinguishing water levels in different aquifer(s).

Temporary Access and Monitoring Agreement

This temporary access and monitoring agreement grants Department of Natural Resources staff access to your property to install a benchmark to use as a reference point to measure lake level changes, survey top of casing and to access the wells on your property to measure depths to water.

_____

_____.

This agreement becomes effective as of _____ (month) _____ (day) _____(year). Participation in the program is voluntary and may be terminated at any time at the sole discretion of the participant.

Printed name _____

Signature _____

Date _____

Alaska Hydrologic Survey staff can notify the property owner 24 to 48 hours before each site visit via the contact information provided below:

mobile phone: _____
home phone: _____

Alex/Susan

What is the current status of the CMS application?

I am concerned reading articles in the paper that everything is being pushed aside so staff can deal with the B&E application. I assume they will be held to the same standards we have been. If so I would expect it will take them at least several weeks to compile all of the data needed for a 17.60 CUP for a monofill. Which would provide staff enough time to complete review of our application?

Have there been any enforcement actions or citations issued to B&E or others for the waste pile shown in the newspaper photos?

Do you expect the B&E issues to negativly impact our application in any way?

Hi Shane,

Susan will be spending quality time with your application very soon. We have been handling B&E's case within legal timeframes and their junkyard/refuse area CUP will be reviewed against the same standards as yours. We have issued an enforcement order to B&E for their junk pile and their application is being processed. B&E's operation should not impact your application.

Permit Tracking #_____

No Exposure Certification for Exclusion from APDES Storm Water Permitting

Submission of this No Exposure Certification constitutes notice that the entity identified in Section I does not require permit authorization for its storm water discharges associated with industrial activity in Alaska identified in Section II under ADEC's Storm Water Multi-Sector General Permit (MSGP) due to the existence of a condition of no exposure.

A condition of no exposure exists at an industrial facility when all industrial materials and activities are protected by a storm resistant shelter to prevent exposure to rain, snow, snowmelt, and/or runoff. Industrial materials or activities include, but are not limited to, material handling equipment or activities, industrial machinery, raw materials, intermediate products, by-products, final products, or waste products. Material handling activities include the storage, loading and unloading, transportation, or conveyance of any raw material, intermediate product, final product, or waste product. A storm resistant shelter is not required for the following industrial materials and activities:

- drums, barrels, tanks, and similar containers that are tightly sealed, provided those containers are not deteriorated and do not leak. "Sealed" means banded or otherwise secured and without operational taps or valves;
- adequately maintained vehicles used in material handling; and
- final products, other than products that would be mobilized in storm water discharges (e.g., rock salt).

A No Exposure Certification must be provided for each facility qualifying for the no exposure exclusion. In addition, the exclusion from APDES permitting is available on a facility-wide basis only, not for individual outfalls. If any industrial activities or materials are or will be exposed to precipitation, the facility is not eligible for the no exposure exclusion.

By signing and submitting this No Exposure Certification form, the entity in Section I is certifying that a condition of no exposure exists at its facility or site, and is obligated to comply with the terms and conditions of 40 CFR 122.26(g), adopted by reference at 18 AAC 83.010(b)(3).

ALL INFORMATION MUST BE PROVIDED ON THIS FORM.

Detailed instructions for completing this form and obtaining the no exposure exclusion are provided on page 3.

Section I. Facility Operator Information

Name: Central Recycling Services

Mailing Address:

Street (PO Box): 2400 Railroad Ave.

City: Anchorage State: Alaska Zip: 99501

Phone: 907-748-7400 Fax(optional):

Email: crs@crs-alaska.com

Section II. Facility/Site Location Information

Facility Name: Central Monofill Services

Street Address: 2480 and 2560 S. Glenn Highway

City: Palmer State: Alaska Zip: 99645

Borough or similar government subdivision: Matanuska-Susitna Borough

Is this facility located on Indian Lands? ☐ Yes ☑ No

Is this a Federal facility? ☐ Yes ☑ No

Latitude: 61.540833 Longitude: 149.169444

Determined By: ☐ GPS ☐ USGS topographic map ■ Other: Google Earth

Was the facility or site previously covered under an NPDES or APDES storm water permit? ☐ Yes ☑ No

If yes, enter the NPDES or APDES permit number or tracking number?

SIC/Activity Codes: Primary: 561210 Secondary (if applicable):

Total size of site associated with industrial activity (in acres): 40 acres

Have you paved or roofed over a formerly exposed, pervious area in order to qualify for the no exposure exclusion? ☐ Yes ☑ No

If yes, please indicate approximately how much area was paved or roofed over. Completing this question does not disqualify you for the no exposure exclusion. However, your permitting authority may use this information in considering whether storm water discharges from your site are likely to have an adverse impact on water quality, in which case you could be required to obtain permit coverage.

Less than one acre ☐ One to five acres ☐ More than five acres ☐

For Agency Use
Permit Tracking #_____

Section III. Exposure Checklist

Are any of the following materials or activities exposed to precipitation, now or in the foreseeable future? (Please check either "Yes" of "No" in the appropriate box.) If you answer "Yes" to any of these questions, (1) through (11), you are not eligible for the no exposure exclusion.

	Yes	No
1. Using, storing, or cleaning industrial machinery or equipment, and areas where residuals from using, storing, or cleaning industrial machinery or equipment remain and are exposed to storm water.	☐	☑
2. Materials or residuals on the ground or in storm water inlets from spills/leaks.	☐	☑
3. Materials or products from past industrial activity.	☐	☑
4. Material handling equipment (except adequately maintained vehicles).	☐	☑
5. Materials or products during loading/unloading or transporting activities.	☐	☑
6. Materials or products stored outdoors (except final products intended for outside use [e.g., new cars] where exposure to storm water does not result in the discharge of pollutants).	☐	☑
7. Materials contained in open, deteriorated, or leaking storage drums, barrels, tanks, and similar containers.	☐	☑
8. Materials or products handled/stored on roads or railways owned or maintained by the discharger.	☐	☑
9. Waste material (except waste in covered, non-leaking containers [e.g., dumpsters]).	☐	☑
10. Application or disposal of process wastewater (unless otherwise permitted).	☐	☑
11. Particulate matter or visible deposits of residuals from roof stacks and/or vents not otherwise regulated (i.e., under an air quality control permit) and evident in the storm water outflow.	☐	☑

Section IV. Certification Statement

I certify under penalty of law that I have read and understand the eligibility requirements for claiming a condition of "no exposure" and obtaining an exclusion from APDES storm water permitting under ADEC's Multi-Sector General Permit.

I certify under penalty of law that there are no discharges of storm water contaminated by exposure to industrial activities or materials from the industrial facility or site identified in this document (except as allowed under 40 CFR 122.26(g)(2)).

I understand that I am obligated to submit a no exposure certification form once every five years to the APDES permitting authority and, if requested, to the operator of the local municipal separate storm sewer system (MS4) into which the facility discharges (where applicable). I understand that I must allow the APDES permitting authority, or MS4 operator where the discharge is into the local MS4, to perform inspections to confirm the condition of no exposure and to make such inspection reports publicly available upon request. I understand that I must obtain coverage under an APDES permit prior to any point source discharge of storm water from the facility.

Additionally, I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is to the best of my knowledge and belief true, accurate and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

Print Name of Authorized Official: Shane Durand Title: Secretary/Treasurer

Signature: Date Signed: 6-3-13 Email: shane@cei-alaska.com

Instructions for the No Exposure Certification for Exclusion from APDES Storm Water Permitting

Who May File a No Exposure Certification

Federal law at 40 CFR Part 122.26, adopted by reference at 18 AAC 83.010(b)(3), prohibits point source discharges of storm water associated with industrial activity to waters of the U.S. without an Alaska Pollutant Discharge Elimination System (APDES) permit. However, APDES permit coverage is not required for discharges of storm water associated with industrial activities identified at 40 CFR 122.26(b)(14)(i)-(ix) and (xi) if the discharger can certify that a condition of "no exposure" exists at the industrial facility or site.

Storm water discharges from construction activities identified in 40 CFR 122.26(b)(14)(x) and (b)(15) are not eligible for the no exposure exclusion.

Obtaining and Maintaining the No Exposure Exclusion

This form is used to certify that a condition of no exposure exists at the industrial facility or site described herein. This certification is only applicable in jurisdictions where ADEC is the NPDES permitting authority and must be re-submitted at least once every five years.

The industrial facility operator must maintain a condition of no exposure at its facility or site in order for the no exposure exclusion to remain applicable. If conditions change resulting in the exposure of materials and activities to storm water, the facility operator must obtain coverage under an APDES storm water permit immediately.

Completing the Form

You must type or print in appropriate areas only. One form must be completed for each facility or site for which you are seeking to certify a condition of no exposure. Additional guidance on completing this form can be accessed at ADEC's Storm water Program website: http://www.dec.state.ak.us/water/wnpspc/stormwater/stormwater.htm .

Please make sure you have addressed all applicable questions and have made a photocopy for your records before sending the completed form to the above address.

Section I. Facility Operator Information

- Provide the legal name of the person, firm, public organization, or any other entity that operates the facility or site described in this certification. The name of the operator may or may not be the same as the name of the facility. The operator is the legal entity that controls the facility's operation, rather than the plant or site manager.
- Provide the telephone number of the facility operator.
- Provide the email address of the facility operator.
- Provide the mailing address of the operator (P.O. Box numbers may be used). Include the city, state, and zip code. All correspondence will be sent to this address.

Section II. Facility/Site Location Information

- Enter the official or legal name of the facility or site.
- Enter the complete street address (if no street address exists, provide a geographic description [e.g., Intersection of Routes 9 and 55]), city, state, zip code, and borough or similar government subdivision. Do not use a P.O. Box number.
- Indicate whether the facility is located on Indian Lands.
- Indicate whether the industrial facility is operated by a department or agency of the Federal Government (see also Section 313 of the Clean Water Act).
- Enter the latitude and longitude of the approximate center of the facility or site. The latitude and longitude of your facility can be determined in several different ways, including through the use of global positioning system (GPS) receivers, U.S. Geological Survey (U.S.G.S.) topographic or quadrangle maps, and EPA's web-based siting tools, among others.
- Indicate whether the facility was previously covered under an NPDES or APDES storm water permit. If so, include the permit number or permit tracking number.
- List the four-digit Standard Industrial Classification (SIC) code and/or two character activity code that best describes the primary industrial activities performed by your facility. Your primary industrial activity includes any activities performed on-site which are:
  (1) identified by the facility's one SIC code for which the facility is primarily engaged; and
  (2) included in the narrative descriptions of 40 CFR 122.26(b)(14)(i), (iv), (v), or (vii), and (ix). See Appendix D of the MSGP for a complete list of SIC codes and activities codes.
- Enter the total size of the site associated with industrial activity in acres. Acreage may be determined by dividing square footage by 43,560.
- Check "Yes" or "No" as appropriate to indicate whether you have paved or roofed over a formerly exposed, pervious area (e.g., lawn, meadow, dirt or gravel road/parking lot) in order to qualify for no exposure. If yes, also indicate approximately how much area was paved or roofed over and is now impervious area.

Section III. Exposure Checklist

Check "Yes" or "No" as appropriate to describe the exposure condition at your facility. If you answer "Yes" to ANY of the questions, (1) through (11), in this section, a potential for exposure exists at your site and you cannot certify to a condition of no exposure. You must obtain (or already have) coverage under an APDES storm water permit. After obtaining permit coverage, you can institute modifications to eliminate the potential for a discharge of storm water exposed to industrial activity and then certify to a condition of no exposure.

Section IV. Certification Information

The Certification of No Exposure, must be signed as follows:

(1) For a corporation, a responsible corporate officer shall sign the Certification, a responsible corporate officer means:

(A) a president, secretary, treasurer, or vice-president of the corporation in charge of a principal business function, or any other person who performs similar policy- or decision-making functions for the corporation; or

(B) the manager of one or more manufacturing, production, or operating facilities, if

(i) the manager is authorized to make management decisions that govern the operation of the regulated facility, including having the explicit or implicit duty of making major capital investment recommendations, and initiating and directing other comprehensive measures to assure long term environmental compliance with environmental statutes and regulations;

(ii) the manager can ensure that the necessary systems are established or actions taken to gather complete and accurate information for permit application requirements; and

(iii) authority to sign documents has been assigned or delegated to the manager in accordance with corporate procedures.

(2) For a partnership or sole proprietorship, the general partner or the proprietor, respectively; or

(3) for a municipality, state, or other public agency, either a principal executive officer or ranking elected official shall sign the application; in this subsection, a principal executive officer of an agency means

(A) the chief executive officer of the agency; or

(B) a senior executive officer having responsibility for the overall operations of a principal geographic unit or division of the agency.

Include the name, title, and email address of the person signing the form and the date of signing. An unsigned or undated Certification form will not be considered valid exclusion from permit coverage.

Where to File Certification form

Please submit the Certification to ADEC as follows:

If you file by mail, please submit the original form with a signature in ink. ADEC will not accept a photocopied signature. Remember to retain a copy for your records.

Certifications sent by mail:

Alaska Dept. of Environmental Conservation
Wastewater Discharge Authorization Program
555 Cordova Street
Anchorage, AK 99501

Subject: Potential easement on section line
Attachments: ADL 230702.pdf; CMS_ADL.pdf

Hi Shane,

The attached DNR case file abstract indicates that there may be a private easement along the east-west section line easement.

Zoom to the project area using the following link and you will see the easement.

http://dnr.alaska.gov/MapAK/browser?url=Case%20Search&reqtype=LINK&fn=230702&ft=ADL

Subject: RE: Potential easement on section line

There is nothing in the Title Report for this. We have had locates done on the property and they do not have any underground lines on the property or section line.

Hi Shane,

The attached DNR case file abstract indicates that there may be a private easement along the east-west section line easement.

Zoom to the project area using the following link and you will see the easement.

SUBJECT: **Central Monofill Services Conditional Use Permit Application**
LOCATION: 17N02E18C010 & 17N02E19B006

Dear Mr. Durand:

This letter is a follow-up to the conversation that Alex Strawn and myself had with you today regarding the CMS conditional use permit application. We discussed the possibility of section line easements adjacent to the south and west sides of the above referenced property (See attached map). Since we spoke you sent us an e-mail stating that the title policy says *"Reservation of section line easement 33 feet in width along each side of the section line as provided by 43 U.S.C.932"*. However, this does not specify if this the north/south or east/west section line easement or both. A verification of section line easement(s) will need to be provided by a registered land surveyor.

In addition, we discussed the requirement to obtain an MSB Permit for Construction within Public Easements & Rights-of-Way to conduct any work within a section line easement. This permit will require a survey to determine the width of the section line easement and will require that the easement be left in a condition in which a road can be constructed. An application form is attached for your use. If you have any questions regarding this application please contact the MSB Right-of-Way Coordinator, Andy Dean, at 861-7803.

We also discussed that should the conditional use permit be a approved, a condition of approval would be that the section line easement(s) be vacated prior to any work being conducted within them.

Should you have any questions or require additional information please let me know.

Sincerely,

Susan Lee

APPLICATION FOR CONSTRUCTION WITHIN PUBLIC EASEMENTS & RIGHTS-OF-WAY

Applicant: _____ Date: _____
Address: _____ Phone: _____
_____ Fax: _____

Office Use Only		
TRS: _____	Permit No: _____	Tax Map: _____ Inspection: _____

1. Give the legal description of property owned by applicant adjacent to construction:
   _____ _____
2. Describe the location where construction will occur, (legal description, public easement, or road name):
   _____ _____
   _____ _____
3. Proposed length and width of construction (include map or sketch showing construction limits and cross section & plan drawings, if available. Drawings may be required in cases of steep terrain):
   _____ _____
   _____ _____
4. Proposed start up date: _____ _____ (minimum of 2 weeks from date application received)
   Expected completion date: _____ _____
5. This construction is necessary for the following reason(s):
   _____ _____
   _____ _____
6. Proposed method for disposal of vegetation and grubbed material:
   _____ _____
   _____ _____
7. List types of construction equipment that will be used for this project:
   _____ _____
   _____ _____
8. Identify any special conditions and problems that may be encountered during construction (i.e. Swampy ground, water bodies, steep slopes, forested areas):
   _____ _____
   _____ _____

Construction permit (application fee prior to construction) $50 each

No work is authorized, including clearing of vegetation, within public easements & rights-of-way until a PERMIT is issued by the Borough and accepted by the applicant. The applicant certifies with their signature below, that they have read the conditions on the reverse side and completed this form accurately to the best of their knowledge.

_____
Applicant's Signature

SAMPLE STANDARD CONDITIONS

Prior to Construction:

A. Registered Professional Land Surveyor to verify, survey and mark exterior limits prior to construction and reference and preserve any survey corners and monuments in construction area. Upon completion, Surveyor to certify in writing to the Borough that all construction is in right-of-way and all survey corners are undisturbed or reset.

B. Notify adjacent property owners by certified mail two weeks prior to construction.

C. Complete a pre-construction meeting on site with Borough Right-Of-Way Agent after condition "A" is complete and prior to beginning any vegetation clearing.

Other Conditions:

1. No public money will be spent on maintenance or capital improvements.

2. Roads within public right-of-ways or public easements are for public use and cannot be gated or blocked.

3. Trees belong to adjacent property owners. Trees left in the right-of-way shall be cut into 4' lengths. Other arrangements made between the Permittee and the property owners are acceptable.

4. Disturb and clear only that area necessary for permitted use.

5. In site specific locations where public rights-of-way widths are 100 feet or greater the Borough may authorize slit trenching to be in the (southern) (western) 20' of right-of-way.

6. All construction debris, including brush, limbs, tree tops, uprooted stumps, organic material and large rocks must be removed from narrow rights-of-way. Construction debris may not be placed onto adjacent properties without written authorization.

7. It is the applicant's responsibility to obtain any required permits from local, state, or federal agencies for the proposed construction.

8. Permits are subject to additional conditions, as deemed necessary by the Borough, to address special circumstances and construction limitations.

9. A Damage Bond and/or Liability Insurance may be required for the proposed construction activity.

Subject: Central Monofill CUP application

Alex,

I understand from your conversation with Shane a couple of days ago that our CUP may not come before the Board until October. Is there any way to move that date up to the September meeting? I have had a trip out of the country planned in October for some time now. As we had discussed months ago, we need to get the CUP before Winter or we run the risk of not being able to complete the site improvements needed to operate until next Spring. I know that your office has been slammed with CUP applications and I appreciate that due to the sensitive nature of the Monofill request review of our CUP application is more time consuming that the normal package, but please consider that we submitted our initial package in January.

I don't want to delay going before the Board until November.

If it is not possible to move it to September, I understand and we will stay on the October schedule, but please consider my request.

Thank you for your consideration.

Alex,
Thank you for the email. To answer your question regarding the section line, wherever there is a section line there is a section line ezt of 33' both East-West & North South.

Hi Tiani,

I am glad we finally connected. Please see email below with attachments and let me know if you have any questions. Also, you said that the section line is 33' on each side; is that the section line that runs east-west through the middle of the property or the north-south line along the west side of the property?

Alex

Please find attached two supplemental drawings to address the section easement concerns. These can be used to show the "conditioned" status of the CUP area. Let me know if you have any questions or concerns on these.

We have done a lot of research on the Alascom Private easement concern. From our research nothing more than an application for easement exists. Nothing is recorded and we have not been approached as the landowner for an easement.

Per the Title Company

"Shane,
Thank you for taking the time to talk with Sharon and I this morning. Per our conversation this email is to follow up and summarize what we have found. Also attached is a copy of the existing MTA Easement that is recorded to the official public record through the State Recorders office at the Department of Natural Resources.

The Section Line Easement was shown on the Title Policy you received and we found it to be 33 feet from the center of each section line boundary of your property.
As for the conflict with a "private easement" as Alex Strawn of the MSB is concerned about, the ADL 230702 in the Land Management filing appears to be an *application* for an easement. We do not find anything of record that reflects this application to have been finalized or the steps taken to create a valid easement. For an easement to be made valid would require it to be transferred by the owner of the fee simple of the property, which being private property would be Central Monofill Services Inc.," " to perfect the position the easement would require the instrument to be recorded in the official public records through the Recorders Office. if this process has been completed and filed of record we would need to receive a copy of the recorded instrument before we could further comment on its affect to title.
I hope that this provides some assistance to you. Please feel free to contact Sharon Elliott or myself directly if we may be of further service.

Tiani Brandner
Business Development / Title Officer w (907) 339-8849 c (907) 764-5073 tbrandner@alyeskatitle.com
Alyeska Title Guaranty Agency
3801 Centerpoint Drive Suite 102
Anchorage AK 99503"

We have made multiple contacts to DNR and Alascom and have found nothing more than an application at this time. This easement application appears to be primarily within the Section line easement and other existing utility easement so it shouldn't conflict at this time anyways.

Let us know if you need anything further on the easement issues or anything else.

Do you have a timeline for our permit moving forward?

Shane:

The revised site plan, dated August 21, 2014, shows how the monofill will slope away from the east/west section line easement. However, this site plan does not indicate how the monofill will slope away from the north/south section line easement. This needs to be shown on the site plan.

Alex

Please find attached two supplemental drawings to address the section easement concerns. These can be used to show the "conditioned" status of the CUP area. Let me know if you have any questions or concerns on these.

We have done a lot of research on the Alascom Private easement concern. From our research nothing more than an application for easement exists. Nothing is recorded and we have not been approached as the landowner for an easement.

Per the Title Company

"Shane,
Thank you for taking the time to talk with Sharon and I this morning. Per our conversation this email is to follow up and summarize what we have found. Also attached is a copy of the existing MTA Easement that is recorded to the official public record through the State Recorders office at the Department of Natural Resources.

The Section Line Easement was shown on the Title Policy you received and we found it to be 33 feet from the center of each section line boundary of your property.
As for the conflict with a "private easement" as Alex Strawn of the MSB is concerned about, the ADL 230702 in the Land Management filing appears to be an *application* for an easement. We do not find anything of record that reflects this application to have been finalized or the steps taken to create a valid easement. For an easement to be made valid would require it to be transferred by the owner of the fee simple of the property, which being private property would be

Central Monofill Services Inc.," " to perfect the position the easement would require the instrument to be recorded in the official public records through the Recorders Office. If this process has been completed and filed of record we would need to receive a copy of the recorded instrument before we could further comment on its affect to title.
I hope that this provides some assistance to you. Please feel free to contact Sharon Elliott or myself directly if we may be of further service.

Tiani Brandner

Alyeska Title Guaranty Agency
3801 Centerpoint Drive Suite 102
Anchorage AK 99503"

We have made multiple contacts to DNR and Alascom and have found nothing more than an application at this time. This easement application appears to be primarily within the Section line easement and other existing utility easement so it shouldn't conflict at this time anyways.

Let us know if you need anything further on the easement issues or anything else.

Do you have a timeline for our permit moving forward?

Susan

I am unsure I clearly understand the question. I have attached sheet 9 (with Drainage Plan) with the drainage lines colored and the section lines labeled to make sure we are talking about the same north south or east west lines. The interception ditch would collect storm water runoff around the perimeter of the monofill along what I have labeled the North/South Section line. The section line easement I have labeled East/West would collect water that runs off the adjacent slope but not the surface of the monofill. The East/West Section line does not drain off the property.

Let me know if this doesn't answer your question or if you would like me to come out and go through this with you.

Thanks

Shane

Subject: No Exposure Certificate for Multi-Sector General Permit

Shane,

I reviewed the No-Exposure Certificate for your facility "Central Monofill Services" and have some follow-up questions.

1. Please describe the type of waste being handled and disposed of at the facility.
2. Please describe how this waste avoids exposure to precipitation.
3. Please describe the flow path of the storm water discharge from the facility. Does the discharge enter a water of the US?

Please provide me answers to these questions by Sept 9, 2014 or sooner.

Thank you for your attention to this matter.

Subject: RE: No Exposure Certificate for Multi-Sector General Permit

Shane,

Based on the fact that there is no discharge to a water of the US, the facility does not need permit coverage under the Multi-Sector General Permit. Therefore no No Exposure Certificate needs to be submitted to DEC.

Thank you for your prompt reply.

Subject: RE: No Exposure Certificate for Multi-Sector General Permit

1. Inert Construction and Demolition Debris and soils.
2. Waste handled at the facility will be per a DEC Solid Waste Inert Monofill Permit. See Answer to #3 as well. Per the permit mono-filled waste is routinely covered with soil to reduce any infiltration. The working face where waste is placed for compaction and covering is built such that storm water will not run into the working face. Lori Aldrich in Solid Waste at ADEC can answer questions particular to our permit application. Monofills etc.
3. Attached is a copy of the drainage plan for the site. There are no "water of the US" on this site. All storm water stays on site and newly constructed surfaces will be graded to drain runoff away from waste as designed. Even the driveway slopes back into the site so there is no way for runoff to leave site or enter waters of US.

We have hundreds of pages of modeling, consultants reports and design information on the water infiltration, precipitation, soil types, waste etc. if you have further questions let me know. All of the supplemental information is fairly large and would need to be burned to a disc. If it helps I could stop by and go through any of this information as well.

I assume your questions were prompted by MSB?

Was this response or something similar sent to them?

Just for further clarification I have attached the JD from the COE establishing no waters of the US.

Subject: RE: No Exposure Certificate for Multi-Sector General Permit

Shane,

Based on the fact that there is no discharge to a water of the US, the facility does not need permit coverage under the Multi-Sector General Permit. Therefore no No Exposure Certificate needs to be submitted to DEC.

Thank you for your prompt reply.

1. Inert Construction and Demolition Debris and soils.
2. Waste handled at the facility will be per a DEC Solid Waste Inert Monofill Permit. See Answer to #3 as well. Per the permit mono-filled waste is routinely covered with soil to reduce any infiltration. The working face where waste is placed for compaction and covering is built such that storm water will not run into the working face. Lori Aldrich in Solid Waste at ADEC can answer questions particular to our permit application. Monofills etc.
3. Attached is a copy of the drainage plan for the site. There are no "water of the US" on this site. All storm water stays on site and newly constructed surfaces will be graded to drain runoff away from waste as designed. Even the driveway slopes back into the site so there is no way for runoff to leave site or enter waters of US.

We have hundreds of pages of modeling, consultants reports and design information on the water infiltration, precipitation, soil types, waste etc. if you have further questions let me know. All of the supplemental information is fairly large and would need to be burned to a disc. If it helps I could stop by and go through any of this information as well.

Shane,

I reviewed the No-Exposure Certificate for your facility "Central Monofill Services" and have some follow-up questions.

1. **Please describe the type of waste being handled and disposed of at the facility.**
2. **Please describe how this waste avoids exposure to precipitation.**
3. **Please describe the flow path of the storm water discharge from the facility. Does the discharge enter a water of the US?**

Please provide me answers to these questions by Sept 9, 2014 or sooner.

Susan

I am unsure I clearly understand the question. I have attached sheet 9 (with Drainage Plan) with the drainage lines colored and the section lines labeled to make sure we are talking about the same north south or east west lines. The interception ditch would collect storm water runoff around the perimeter of the monofill along what I have labeled the North/South Section line. The section line easement I have labeled East/West would collect water that runs off the adjacent slope but not the surface of the monofill. The East/West Section line does not drain off the property.

Let me know if this doesn't answer your question or if you would like me to come out and go through this with you.

Thanks

Shane

Shane:

The revised site plan, dated August 21, 2014, shows how the monofill will slope away from the east/west section line easement. However, this site plan does not indicate how the monofill will slope away from the north/south section line easement. This needs to be shown on the site plan.

Alex

Please find attached two supplemental drawings to address the section easement concerns. These can be used to show the "conditioned" status of the CUP area. Let me know if you have any questions or concerns on these.

We have done a lot of research on the Alascom Private easement concern. From our research nothing more than an application for easement exists. Nothing is recorded and we have not been approached as the landowner for an easement.

Per the Title Company

"Shane,
Thank you for taking the time to talk with Sharon and I this morning. Per our conversation this email is to follow up and summarize what we have found. Also attached is a copy of the existing MTA Easement that is recorded to the official public record through the State Recorders office at the Department of Natural Resources.

The Section Line Easement was shown on the Title Policy you received and we found it to be 33 feet from the center of each section line boundary of your property.
As for the conflict with a "private easement" as Alex Strawn of the MSB is concerned about, the ADL 230702 in the Land Management filing appears to be an *application* for an easement. We do not find anything of record that reflects this application to have been finalized or the steps taken to create a valid easement. For an easement to be made valid would require it to be transferred by the owner of the fee simple of the property, which being private property would be Central Monofill Services Inc.," " to perfect the position the easement would require the instrument to be recorded in the official public records through the Recorders Office. If this process has been completed and filed of record we would need to receive a copy of the recorded instrument before we could further comment on its affect to title.
I hope that this provides some assistance to you. Please feel free to contact Sharon Elliott or myself directly if we may be of further service.

Tiani Brandner
Business Development / Title Officer w (907) 339-8849 c (907) 764-5073 tbrandner@alyeskatitle.com
Alyeska Title Guaranty Agency
3801 Centerpoint Drive Suite 102
Anchorage AK 99503"

We have made multiple contacts to DNR and Alascom and have found nothing more than an application at this time. This easement application appears to be primarily within the Section line easement and other existing utility easement so it shouldn't conflict at this time anyways.

Let us know if you need anything further on the easement issues or anything else.

Do you have a timeline for our permit moving forward?

Susan,

I was wondering if I could get an update on the status of our CUP application? Everything still on for Dec 1st?
Not waiting for anything from us?
Any new concerns been raised?
What is the time frame for public notice?

I would also like to submit the attached ADEC inspection report. Many people at the last hearing made comments that the ADEC does not inspect monofills. This proves they do inspect and further more we are proud of getting a perfect score on the inspection of our existing facility in Salcha. This proves we are a good operator.

The only negative with this report was ADEC noted they had received a complaint from a neighbor about traffic, road conditions, etc. upon investigation we found out the trucks the neighbor had complaints about were State of Alaska trucks that were improving Canaday Road, which is state maintained. The complaint although directed at our operation was with something not affiliated with our facility and ADEC took no action.

If you have any questions or need anything more from us please don't hesitate to ask.

Respectfully,

Shane Durand

I was wondering if I could get an update on the status of our CUP application? Everything still on for Dec 1st?
Not waiting for anything from us?
Any new concerns been raised?
What is the time frame for public notice?

I would also like to submit the attached ADEC inspection report. Many people at the last hearing made comments that the ADEC does not inspect monofills. This proves they do inspect and further more we are proud of getting a perfect score on the inspection of our existing facility in Salcha. This proves we are a good operator.

The only negative with this report was ADEC noted they had received a complaint from a neighbor about traffic, road conditions, etc. upon investigation we found out the trucks the neighbor had complaints about were State of Alaska trucks that were improving Canaday Road, which is state maintained. The complaint although directed at our operation was with something not affiliated with our facility and ADEC took no action.

If you have any questions or need anything more from us please don't hesitate to ask.

Respectfully,

Shane Durand

SUBJECT: **Central Monofill Services Conditional Use Permit Application**
LOCATION: 17N02E18C010 and 17N02E19B006

Dear Mr. Durand:

The application for a conditional use permit on the above referenced property has been distributed for comments. In accordance with the requirements of MSB 17.03 – Public Notification, the applicant shall pay the cost of mailings or advertisements required by ordinance specific to that action. Payment must be received by the Matanuska-Susitna Borough **prior** to the public hearing. Please be advised of the following charges:

Advertising:	$191.25
Mailing:	108.25
TOTAL DUE:	$299.50

The advertisement was published in the October 17, 2014 Frontiersman. The public hearing is scheduled for the **December 1, 2014** Planning Commission meeting. Public hearings begin at 6:15 p.m. and it would be in your best interest to be in attendance or to be represented at that meeting.

Should you have any questions or require additional information please contact me at the above address, phone# 861-7862, or e-mail: slee@matsugov.us.

Sincerely,

Susan Lee

Hi Susan -- I'm trying to get a look at Central's monofill application but can't find it online and it sounds like a huge document. Is there any way for you to email me the smaller application itself without attachments? I've heard that's only about 40 pages.

I could also come in and look at it, whatever's easier for you. Or, obviously, if it's posted online somewhere, just direct me to the right link!

Yes, it is a huge document. We posted 1031 pages on the website. You can find it by going to www.matsugov.us and clicking on 'Public Notices'. We have a hard copy at the Permit Center for people to look at. Or you can make a public records request and we can burn you a CD for $7.50.

Let me know what works best for you.

Subject: Screening

Shane:

This is a follow-up to our earlier discussion regarding screening the monofill from the section line easements. MSB 17.60.110(A) states *"No junkyard or auto wrecking yard shall be established or operated unless the wrecking yard is completely obscured from the view of any traveled or public right-of-way. the permit may require the junkyard or auto wrecking yard not within a building to be contained within a continuous solid fence no less than eight feet in height. if such requirement is necessary to prevent the unsightly display of the yard or for public safety purposes. Fencing may be of one or a combination of the following:*

(1) conventional solid wood or metal fencing;
(2) evergreen or other natural planting sufficient to provide year-round screening; and
(3) earthen berm or topography.

MSB 17.60.110(B) states *"In all cases, fencing provided shall be continuous and of sufficient density to provide visual screening required by this chapter on a year-round basis".*

Please let us know how you plan on providing year-round screening of the monofill operation from the section line easements, as this issue will have to be addressed in the staff report.

Attachments: 20141021144155.pdf

Susan

This may be easier to explain tomorrow with the drawings in front of us and I will bring some pictures. I attached a sketch.

Our Jan package, page 29 of 38, states the cells are about 125' wide. We would build sub cells 125' center of one wall to the other but they would extend the length of a Cell. He says 120' wide as you have the width of the berm to account for.

I assume you are looking at the May 13 Maddox report page 15. The 120'x50' he is referring to is the "Working Face" This is the area where material is actively being dumped and compacted. After this step it is covered. Maddox is indicating the working face, where material is loose and not completely compacted is most vulnerable to infiltration. As the compactor densifies and compacts the working face the sub cell is filled to depth.

As the working face advances and the sub cell is filled to depth the soil cover is placed on top. The largest area exposed from the front of the working face to soil cover is 25,000 sf

Hopefully this helps.

Subject: question

I need some clarification on the cell sizes. Maddox says they will be 120' x 50' and the CMS application material says they will be 125' wide. What dimension is correct?

Also, I just want to clarify that 25,000 square feet, not cubic feet, is the maximum area that will be exposed and not covered at aany one time during the monofill operation.

LOCATION: Glenn Hwy. at mile 38.3 behind the shooting range across from the Granite gravel pit.

MOTIVE: CMS is a private, for-profit shell corporation that will dispose of mostly Anchorage building waste on private land so that its owners can profit by avoiding the necessary cost of public dump fees. Because CMS operates as a shell corporation without large corporate assets, its owners can operate without incurring any significant liability for the future environmental damage that is predicted.

Page 2087
NOVEMBER 7, 2016
PLANNING COMMISSION

ASBESTOS

There is no independent inspection process to assure proper asbestos containment at this PRIVATELY OWNED, FOR PROFIT dump. The Palmer dump already has an asbestos cell and C&D (construction and demolition) section with proper oversight. AK Demo already runs a private C&D dump 2 miles away.

POISON WELLS UP TO A MILE FROM THE SITE

A borough sponsored hydrological evaluation concludes: "Contaminants could travel approximately a mile down-gradient and still exceed drinking water standards". A quote from CT.gov states, "wood waste from construction, renovation and demolition, pressure treated timber … may contain creosote, lead, acrylic, chromium, pentachlorophenol, phenol-formaldehyde resins, and other known carcinogens and ground water contaminants…. These pollutants can leach into the ground water" (http://www.ct.gov/deep/cwp/view.asp?a=2718&q=325342)

ENVIRONMENTAL CRIME HISTORY

While being cited for **illegally dumping** waste without a permit or even a business license, CMS Corporate Officer Shane Durand stated, "the solution to pollution is dilution." The company was later fined and were repeatedly ordered to clean up although they claimed the dumped material was not trash-see photo.

(MSB Code compliance case summary G20130022 page 5—Read the official report at PalmerToxicDumping.Org)

CONTAMINATION OF FISHING IN THE KEPLER-BRADLEY LAKE SYSTEM

The site sits on top of the open aquifer that flows through fishing and recreation areas at Canoe Lake, Kepler-Bradley Lake, and beyond. Approval of a combination dump & junkyard permit for this property will allow fuel tanks and potentially leaky equipment to be parked on the edge of man-made gravel pit lakes OPEN TO THE AQUIFER.

WINDBLOWN TRASH

"Valley Trash" *will* be what people see on their way to Palmer. That affects tourism, business, property values and tax revenues.

PalmerToxicDumping.Org

Junkyard permit will allow fuel tanks next to gravel-pond lakes that feed directly into wells and our aquifer

Alaska DEC has already "tentatively approved" the project pending a borough permit

Hi Lori,

I trust you are doing your best, and I appreciate your quick responses.

I do think it's relevant (and good government) that ADEC straighten out the record given that this matter is in front of a government body that will be deliberating using the official record. There are misstatements in that record that ADEC has approved the permit and no corresponding statement from ADEC to the contrary.

Sending a letter or email to the borough simply ensures that everyone is on the same page and has the correct information straight from ADEC and can refer to that if questions arise.

Thank you,

Stephanie Nowers

Actually, now that you mention it, I may have sent an email to Susan Lee. I was searching for one sent to CMS. Unfortunately I do not currently have access to my email archives. I will check when access is available. It may also be quoted in a frontiersman article if you check those.

It was reiterated several times to several sources, but as we did not do a formal review of the CUP application, and, it is irrelevant until we make a permit decision, it was not documented to the file.

Thank you,
Lori

Hi Lori,

I hate to be a bother. But ADEC, as a state agency, needs to be clear about its record and actions.

Central Monofill Services' repeatedly states in their application to the Mat-Su Borough that they have ADEC approval for their monofill design. From what you say in your email below, this is not true.

I think it is incumbent on ADEC to correct the record and send a formal statement to the Mat-Su Borough and CMS to make sure the record is clear for all involved. Saying you corrected CMS' misstatements verbally with no record of that communication is not a clear record.

I also believe it is incumbent on ADEC to send this formal statement to the Mat-Su Borough before the Oct. 31 deadline for comments so that it is part of the official record to the Mat-Su Borough Planning Commission and they are operating with correct and true information. This can be done simply by sending a letter to Mat-Su Borough Planner Susan Lee who is in charge of collecting comments at slee@matsugov.us

Below are cited some but perhaps not all of the references in CMS' application where they state they have ADEC approval. This can all be confirmed by looking at CMS' application which is online at the Mat-Su borough website.

Thanks Lori. And sorry again to be a bother since I know you are busy. I have copied Bob as your email indicated you might not be checking your email regularly this week and there is a public comment deadline looming.

<lori.aldrich@alaska.gov> wrote:

Stephanie,

ADEC has never issued any approval of the design. At the time we first went to public notice, we agreed that the application and the design met the regulations, as presented. The purpose of the public notice was to identify any items that might have been at issue in our understanding of the conditions and potential impacts of the site. If no additional information had surfaced, and the retesting of the groundwater elevations had confirmed the distance to groundwater, we could have issued a permit for the facility without the asbestos cell, which would have been conditioned upon receiving the MSB Conditional Use Permit. However, since that appeared to be the larger hurdle, we chose to wait until they completed the CUP rather than research the information collected. Since CMS has submitted updated site conditions (survey) and we need to add the question of the asbestos cell, the new public notice is being issued.

When the permit application was first submitted, our regulations did not require a specific design approval. We have since issued new regulations that do require it (18 AAC 60.203). A design decisions will be provided at the time the permit decision is provided.

I was hoping to get the public notice issued today, but that is looking less and less likely, and I will be out of the office the rest of the week. I will let you know when it is issued and will be published in the Frontiersman.

Thanks,
Lori

BULL

The BULL™: BEST mobile litter fence

New Canopy Design

Our 15ft high BULL with Canopy™ and Side-nets™ captures and holds litter better. Our standard outriggers, shown here deployed at the 1st setting, provide maximum stability.

THE BULL: Blowing Litter's Worst Enemy

- Designed to withstand winds over 65mph—outriggers, standard on the BULL, can be deployed to provide maximum overturning resistance.
- The BULL Canopy™ and Side-nets™ keep litter from escaping—no litter slipping off the edges between adjacent units. They also catch their share of litter in shifting winds.
- Fully adjustable hooks—operators can easily pick up and move the Bull using a wide selection of equipment.
- Strong steel back net—galvanized and vinyl coated.
- Wear-plates on front surfaces—provide additional stability and protection.
- Net supports with steel framing—easily take on harsh landfill conditions.

Five year warranty.
Move the BULL everyday in rough landfill conditions without damage. The BULL is designed and built to be strong.

Lower your operating costs.
Reduce manual labor picking up litter.

Increase your profit.
Stay open on windy days when you would normally close.

Keep your regulators and neighbors satisfied and avoid fines.
Stop your blowing litter at the working face.

Specifications:
Height: 15ft Length: 24ft Weight: 3070lbs
Depth: 8ft without outriggers deployed
Depth with Outriggers: 1st Setting- 11ft 6in, 2nd Setting- 15ft
Specifications subject to change without notification.

Stephanie,

First, let me apologize for the term "irrelevant", I should not be answering emails when I am travel weary. My intent was to that communicate that the MSB CUP is not material to our permitting process, other than the fact that the monofill could not operate without both permits.

Back to the question at hand, I have located the comment email that I sent to CMS, which was also BCC'd to Susan Lee on March 7, 2014. I will come into the office on Friday to send you a copy, as I have not been able to properly recover the archive using my available electronics. I will also make sure it is submitted as record to MSB, and I will reiterate that we have not issued any approvals for the permit or the submitted design. Any decisions will be documented at the time we issue our permit decision.

Thanks,
Lori

To: Aldrich, Lori (DEC); Stephanie & Stephen Nowers
Cc: Susan Lee; Blankenburg, Robert J (DEC)
Subject: RE: URGENT: DEC correction on misstatements about approval of monofill design

Lori,

To quote your email of March 19, 2014.

"Page 17 - Alaska Department of Environmental Conservation (ADEC) reviewed the CMS Monofill Permit application for this site and has approved the permit conditioned upon receipt of the MSB CUP.

ADEC has NOT APPROVED the permit – the permit application was deemed complete and a public notice was issued. ADEC also noted, in discussions with CMS, that if any significant changes were made to the permit application information in regard to the requirements of the Conditional Use Permit (CUP) issued by MSB a new complete ADEC monofill application would need to be submitted, including a new public comment period."

Per your email and questions raised by MSB staff of the original January 2014 application this was clarified in the May supplemental package to the MSB.

First, let me apologize for the term "irrelevant", I should not be answering emails when I am travel weary. My intent was to that communicate that the MSB CUP is not material to our permitting process, other than the fact that the monofill could not operate without both permits.

Back to the question at hand, I have located the comment email that I sent to CMS, which was also BCC'd to Susan Lee on March 7, 2014. I will come into the office on Friday to send you a copy, as I have not been able

to properly recover the archive using my available electronics. I will also make sure it is submitted as record to MSB, and I will reiterate that we have not issued any approvals for the permit or the submitted design. Any decisions will be documented at the time we issue our permit decision.

Thanks,
Lori

Actually, now that you mention it, I may have sent an email to Susan Lee. I was searching for one sent to CMS. Unfortunately I do not currently have access to my email archives. I will check when access is available. It may also be quoted in a frontiersman article if you check those.

It was reiterated several times to several sources, but as we did not do a formal review of the CUP application, and, it is irrelevant until we make a permit decision, it was not documented to the file.

Thank you,
Lori

I also believe it is incumbent on ADEC to send this formal statement to the Mat-Su Borough before the Oct. 31 deadline for comments so that it is part of the official record to the Mat-Su Borough Planning Commission and they are operating with correct and true information. This can be done simply by sending a letter to Mat-Su Borough Planner Susan Lee who is in charge of collecting comments at slee@matsugov.us

Below are cited some but perhaps not all of the references in CMS' application where they state they have ADEC approval. This can all be confirmed by looking at CMS' application which is online at the Mat-Su borough website.

Thanks Lori. And sorry again to be a bother since I know you are busy. I have copied Bob as your email indicated you might not be checking your email regularly this week and there is a public comment deadline looming.

Reference: Gateway Community Council Resolution 01-14

Central Monofill Services (CMS) as a property owner in the Gateway Community Council would like to respond to Resolution 01-14.

CMS is disappointed that the Gateway Community Council elected to pass this resolution without providing us the opportunity to present the project at a council meeting. We understand that the proposed use of a portion of our property as a Recycle Facility and Monofill has raised concerns with members of the council and that to many people any type of Landfill has a negative stereotype. CMS recommends the Council review the CMS 2014 Conditional Use Permit application in its entirety or contact us for more details and information on the proposed project. Concerns and issues raised by the community have been addressed in detail in our 2014 Conditional Use Permit (CUP), application. We have had informational meetings for the community and have an open door policy to see our operations in efforts to help educate the community on our proposed operations. Concerns raised by neighbors over contamination and water issues led CMS to commission engineering studies by both local engineers and nationally recognized experts in the field. These subject matter experts determined our design at this location to be safe and protective of public health.

CMS has operated a similar Monofill in Salcha, Alaska since 2012. Prior to receipt of our permits for the Salcha facility we heard many of the same concerns and misconceptions from our Salcha neighbors. Today those same neighbors have firsthand knowledge of our successful operations and have written letters of support. If after a review of the application materials questions still exist we will gladly have another informational meeting for the community council.

Thank you for the consideration.

Subject: Re: clarification

Some stored in and some out. Yes they will be screened. This would generaly be area behind scales and around shop building. Clearly separated from the monofill. We would sell to the public but would not be open for people to come and go at will. Acess is controled.

I am asking this because any outdoor storage of these types of materials must also be screened. It looks like if they are stored outside they should be screened by the berms. Also, will the recycle yard be open to the public for purchasing materials?

Subject: Outline of Data Collection Plan to Document Hydrological Subsurface Conditions.pdf
Attachments: Outline of Data Collection Plan to Document Hydrological Subsurface Conditions.pdf; ATT00001.txt

Based on our conversations i have attached a proposed plan that may help with fears associated with water in relation to the monofill. Let me know if you have any questions. Shane

Outline: Data Collection Plan to Document Hydrological Subsurface Conditions

CMS Monofill, Palmer

1. Introduction
   a. Based on the site location within a zone of low precipitation (< 25" per year), there are no regulatory requirements for a ground water monitoring plan for the proposed monofill.
   b. At the request of the Matanuska-Susitna Borough Planning Department, CMS has contracted a professional hydrologist to develop a subsurface hydrological testing plan. The plan is in the process of being developed and will be submitted to the Matanuska-Susitna Borough Planning Department for final approval before placement of any waste in the monofill.
2. Well Placement
   a. Locations: Existing wells were used to establish baseline hydrological conditions at the site. The locations of the five wells closest to the monofill are shown in Figure 1 as well as the proposed location of a new well. The new well will be placed directly down gradient of Cell A.
   b. Well Installation: The existing wells were installed and the new well will be installed based on Alaska's Monitoring Well Guidance, updated November 2011.
3. Results of Baseline Testing
   a. Water Levels: A full year (23 events) of water level measurements have been collected and show consistent ground flow at the site. Figure 1 shows the flow direction based on this data.
   b. Chemical Data: Baseline chemical data of the ground water at the site has been collected with several thousand individual results from three different seasons (spring, fall and winter).
   c. A statistical analysis will be performed on the baseline data in accordance with ASTM D 6312 to determine appropriate indicator tests to be used in future testing. This statistical approach is designed to be used as an early detection program.
4. Future Testing
   a. Data Collection Frequency: Bi-annual hydrological data collection during the spring and fall.
   b. Duration of Data Collection Program: For the life of the monofill operations.

Subject: Palmer CMS Inert Waste Monofill Public Notice

Please forward this to any interested parties:

The Public Notice for the Palmer CMS Inert Waste Monofill has been posted on the ADEC Website http://dec.alaska.gov/commish/public_notices.htm

It should be posted in the Frontiersman on November 14 & 16.

Since I will be out of the office for two weeks at the 30-day mark, I have extended the closing date to December 29.

A copy of the application will be available on our website - http://dec.alaska.gov/eh/sw/index.htm, for review, by the first posting in the Frontiersman.

Thank you,
Lori

Subject: RE: info

To follow up
Central Monofill Services CMS owns the monofill properties and holds the permits for the properties.
Central Recycling services CRS owns and operates the recycle facilities and holds the operations contract with CMS to run the monofills
Central Environmental Inc. CEI is the demolition and abatement company and is a customer of CRS.

Separate companies but same owners.

Attached are the first couple tire bale photos I came to. If you want something different let me know.

Not sure what you mean by asphalt in asphalt? If your are referring to asphalt oil cement in its liquid state, that is used to make asphalt pavement, the answer is no. We will not dispose of asphalt cement oil. Asphalt cement oil is mixed with rock aggregates at high temperature to make asphalt pavement. We crush old asphalt pavement into a State of Alaska Department of Transportation specified product, RAP. Asphalt pavement is a product we recycle into Recycled Asphalt Pavement (RAP). RAP may be used within the monofill foot print to build roads or other surfaces but would not be disposed of or thrown away per say as it has a commodity value.

Hopefully this helps.

The only time we see something like this is an asphaltic type of mastic sometimes used as water proofing or adhesive on concrete. We can't recycle this concrete if the mastic has asbestos on it. This material would be monofilled, typically as a non-friable asbestos. The asbestos fibers are locked in to the mastic coating.

PLANNING COMMISSION
RESOLUTION 14-33

By: Susan Lee
Introduced: November 3, 2014
Public Hearing: December 1, 2014
Action:

MATANUSKA-SUSITNA BOROUGH
PLANNING COMMISSION RESOLUTION NO. 14-33

A RESOLUTION OF THE MATANUSKA-SUSITNA BOROUGH PLANNING COMMISSION APPROVING A CONDITIONAL USE PERMIT UNDER MSB CODE 17.60 FOR THE OPERATION OF A MONOFILL FOR THE DISPOSAL OF INERT CONSTRUCTION AND DEMOLITION DEBRIS, INCLUDING REGULATED ASBESTOS-CONTAINING MATERIAL (RACM) AND NON-REGULATED ASBESTOS-CONTAINING MATERIAL (NON-RACM) AND AN OUTDOOR STORAGE YARD FOR THE SALE OF SALVAGEABLE/RECYCLABLE MATERIALS, LOCATED AT 2840 S. GLENN HIGHWAY (TAX ID: 17N02E18C010) AND 2560 S. GLENN HIGHWAY (TAX ID: 17N02E19B006); WITHIN TOWNSHIP 17 NORTH, RANGE 2 EAST, SECTIONS 18 AND 19, SEWARD MERIDIAN

WHEREAS, an application for a conditional use permit under MSB 17.60 has been received for the operation of a monofill for the disposal of inert construction and demolition debris and an outdoor storage yard for the sale of salvageable/recyclable materials at 2840 S. Glenn Highway (Tax ID: 17N02E18C010) and 2560 S. Glenn Highway (Tax ID: 17N02E19B006); and

WHEREAS, the planning commission reviewed this application, associated materials, and the staff report, with respect to standards set forth in MSB 17.60.100 and 1760.110; and

WHEREAS, findings of fact and conclusions of law have been listed in the staff report dated December 1, 2014; and

WHEREAS, the planning commission conducted a public hearing on December 1, 2014 on this matter; and

WHEREAS, in 2013 Borough staff documented trash and daily cover (screened fines) that had blown from the monofill site onto adjacent properties; and

WHEREAS, ADEC regulations (18 AAC 60.420(2)) state a monofill must be operated so that litter is controlled by fencing or other approved means, and is removed from access roadways and other areas in the facility; and

WHEREAS, this region experiences frequent multiple-day high-wind events each year since it is at the confluence of the Matanuska and Knik River valleys. Loose debris and dust from the fill has, and is, expected to continue to scatter beyond the boundaries of the site; and

WHEREAS, the 15' tall cell berms will be constructed prior to waste placement; and

WEHREAS, as the cells increase in height the sides will be built up with tire bales that will be covered with topsoil and seeded for revegetation; and

WHEREAS, the use of a large sheep's foot landfill compactor to place and immediately compact the waste in the cell is the next method to prevent loose and blowing debris; and

WHEREAS, regularly covering the waste with soil further prevents blowing debris; and

WHEREAS, the daily cover/screened fines consist of shredded materials that are less than three inches in size. Material this size is easily distributed by the wind; and

WHEREAS, the inert debris that will be deposited on the site will be shredded into pieces 12 inches or smaller. Material this size can also become windblown; and

WHEREAS, after the residual material is deposited and compacted it will be covered with the daily cover/screened fines, which will also be compacted. The monofill material will be covered with soil weekly; and

WHEREAS, the applicant has stated that a remote weather station will be placed on the site to monitor wind and when sustained wind conditions on the site exceed 20 mph, waste will not be unloaded without secondary containment in place; and

WHEREAS, secondary containment proposed by the applicant involves the use of portable catch fences up to 15' tall and of variable lengths. The catch fences are used to slow the wind down and catch blown debris downwind; and

WHEREAS, normal size opening on the catch fences is 2" x 2"; and

WHEREAS, the openings on the catch fences are still large enough that smaller pieces of material could still blow through them; and

WHEREAS, the previous use of this site was for earth materials extraction. There are pre-existing legal nonconforming use rights for earth materials extraction for this property, which means that the industrial use was not approved under the current regulatory structure or evaluated for compatibility with surrounding land uses; and

WHEREAS, the surrounding land uses include earth material extraction sites to the north and on the south side of the Glenn Highway; residential subdivisions to the west and northeast; and agricultural uses to the east of the site; and

WHEREAS, the site is required to be visually screened on a year round basis from the view of any traveled or public right-of-way. The site must be screened from the Glenn Highway and from the section line easement on the west side of the property and the east-west section line running through the middle of the property. Staff is recommending the site also be screened from the residential properties on the west side; and

WHEREAS, the proposed monofill is an industrial use. The monofill can be screened with existing berms and by building up the berms and constructing site obscuring fencing. Screening from the western properties will have to be developed as the site is built up; and

WHEREAS, salvageable/recyclable materials that are stored outside must also be screened from the Glenn Highway and section line easements on the property; and

WHEREAS, the maximum finished elevation of the monofill will be 162 feet Above Sea Level. The adjacent Glenn Highway has an average finished elevation of 117 feet Above Sea Level, so the maximum height will be a little more than 40 feet above the Glenn Highway. The existing tree covered berm along the highway has an average elevation of 130 feet Above Sea Level. The finished revegetated height of the monofill will be above the berm on the south side, adjacent to the Glenn Highway. The maximum depth of the monofill will be 75 feet with an average depth of 50 feet; and

WHEREAS, should the site be modified as a result of the Glenn Highway Reconstruction Project, an updated site plan and plan of operations will need to be submitted to the Borough; and

WHEREAS, conditions can be set to prevent material from blowing off-site; and

WHEREAS, documentation has been provided demonstrating that the monofill operation does not have the potential for groundwater contamination that could have negative effects on drinking water and surface water quality; and

WHEREAS, the monofill can be developed with proper engineering and operational controls to protect the natural resources and public health and safety; and

WHEREAS, with conditions, the proposed conditional use is consistent tithe goals and policies of the Borough-Wide Comprehensive Plan (2005 Update) and the Core Area Comprehensive Plan (2007 Update); and

WHEREAS, the proposed monofill will preserve and will not detract from the value, character and integrity of the surrounding area as the monofill will be screened from the Glenn Highway, section line easements, and residential properties. Conditions will be set to address trash and debris containment on the site. Documentation has been provided showing that the proposed monofill will not contaminate the groundwater or have negative effects on drinking water or surface water quality; and

WHEREAS, comments received regarding the proposed monofill raised the following concerns: dumping of material without MSB or ADEC permits; dumping of hazardous waste; trash in the water; waster pollution; health problems; pollution of surrounding lakes; protection of watershed and aquifer; compromising the aquifer; windblown unhealthy dust and particulates from the monofill; contamination of water wells; windblown materials/debris onto surrounding properties; previous problems with gravel extraction on this property and rising water table;

breaching of berm between two of the manmade lakes and impact on surrounding water levels; lack of oversight and planning; applicants disregard for regulations; lack of CMS's ability to manage and provide oversight of the facility; concerns about reclamation of the property; contamination of soil; lowering of property values; the Glenn Highway is a Scenic Byway; threat to migratory and breeding birds; how the redesign of the Glenn Highway will affect this site; rising water levels of nearby lakes; improper handling and disposal of asbestos; concerns about lead based paint, mercury and heavy metals deposited in the monofill; too close to residential area; contamination of fish in Canoe, Kepler-Bradley Lake system; inconsistent with comprehensive plans, and highway safety and access issues; and

WHEREAS, there have been many concerns and comments regarding the potential for groundwater contamination that could have negative effects on drinking water and surface water quality. The applicant has provided documentation from four consultants that this will not be the case: Groundwater data has been collected. Based on the groundwater data the monofill will be designed to be at least 10 feet above groundwater. Water level data is continually being collected. The water table generally fluctuates less than one foot. The water that supplies the unconfined aquifer that underlies the proposed monofill is primarily through infiltration from the Matanuska

River. The bottom of the monofill cells will be established based on all of the water data that is collected up to the time of construction of that cell. On-site groundwater monitoring wells were installed. Three wells lie under the footprint of the proposed monofill, which can be utilized to indicate the depth of water beneath the refuse. Historical groundwater levels will be used to determine the historical high groundwater levels beneath the proposed monofill site. If there is any leachate at all, the monofill is designed to minimize the moisture levels in the material, so that the rate of decay and rot will not significantly impact any leachate that leaves the monofill. The monofill is designed so that waste will not stay in a saturated condition. CMS submitted a groundwater monitoring plan with their application. Subsequently CMS withdrew the plan after their consultant EMI found that the probability of creating a leachate that would impact the groundwater is so low. The proposed monofill is located in a semi-arid climate where the balance between the annual precipitation and the annual evaporation precludes the formation of any significant volume of leachate. The average annual precipitation rate in the area of the proposed monofill is approximately 15 inches. Under these climatic conditions, particularly when the precipitation is less than 15.75 inches per year, leachate is not formed in a landfill. Material brought to the facility is sorted, screened

and processed to ensure that the material is free of hazardous waste and putrescible material and/or liquids. CRS removes large quantities of drywall from the waste stream for recycling. No significant water will be available to percolate through the inert waste, nor to "pond" at any level within the refuse mass. ADEC requirements are met for an inert landfill with respect to the 10' minimum separation distance between the bottom of the refuse and the recorded historic high water table and no liner is required. Testing for potential contamination from the waste has occurred. EMI tested the residual material using the Synthetic Precipitation Leaching Procedures (SPLP) to check for potential contaminants of concern from the waste. This method is not used to test water for drinking water standards. It is designed to identify contaminants that may be of potential concern in waste water. Modeling results have indicated that there will be no contaminant plume extending down gradient from the landfill mass. Leachate modeling identified two potential contaminants of concern: sulfate and manganese. The results predict that the analytes will likely comply with ADEC's drinking water standards. The development of a vegetative cover will result in increased evaporation (evapotranspiration) and the minimal infiltration will be reduced as the landfill evolves, cell by cell. Establishment of the native ground cover

on the final cap of each cell will result in increased evapotranspiration and reduced potential for infiltration; and

WHEREAS, a total of ten cells will be constructed over the life of the monofill. The working face receiving the inert materials will comprise, at any one time, an area measuring 120' x 50'. Therefore, the surface of the monofill most vulnerable to infiltration by precipitation at any one time will be kept to a minimum; and

WHEREAS, the monofill is designed to minimize the moisture levels in the material so that the rate of decay and rot will be very slow and will not significantly impact any leachate, if there is any leachate at all that leaves the monofill; and

WHEREAS, ADEC regulations state that an unlined landfill may not be located closer than 10 feet above the highest measured level of an aquifer of resource value unless the landfill is constructed two feet or more above the natural ground surface (18 AAC 60.217); and

WHEREAS, under Alaskan administrative regulations, this proposed monofill is exempt from providing groundwater monitoring and corrective action to state agencies, as it is located in an area with 25 inches or less in total precipitation each year, per ADEC regulations (18 AAC 60.820(a)(8); and

WHERAS, CMS withdrew their groundwater monitoring plan from the application material. Staff is recommending that a

groundwater monitoring plan be required by the Borough Planning Commission and implemented in the conditional use permit; and

WHEREAS, the monofill is being designed so that a significant amount of leachate will not be produced; the groundwater level has been determined; no contaminant plume will extend down gradient from the monofill; and there will be minimal infiltration. A condition will be set to implement a groundwater monitoring plan at this site; and

WHEREAS, materials brought to the facility that have not been previously inspected will be deposited onto an impermeable pad for inspection, recyclable materials removed and the remaining non-recyclable material placed in the active monofill cell; and

WHEREAS, the applicant states that the following material will not be accepted at this monofill: PCBs or other hazardous wastes, household waste, putrescible waste, liquids, compressed gas cylinders, batteries, appliances with CFC/HCFC, animal carcasses, and petroleum contaminated materials; and

WHEREAS, Alaska Statutes 46.03.900(1) – defines "hazardous waste" as "A waste or combination of waste that because of quantity, concentration, or physical, chemical, or infectious characteristics may: cause or significantly contribute to, an increase in mortality or an increase in serious irreversible or incapacitating reversible illness; or pose a substantial present

or potential hazard to human health or the environment when improperly managed, treated, stored, transported, or disposed of"; and

WHEREAS, material haulers transporting any demolition and/or renovation material to a CRS facility or this monofill must provide the following documentation: (1) A copy of all Hazardous Building Material Surveys for each project that will be bringing their demolition and/or renovation material to the facility. Should the Survey indicate the presence of any hazard materials, then (2) a letter from the Contractor of each project is also submitted to CRS stating that all hazardous material has been properly removed from the project and there is no hazardous material being brought to the CRS facility. For their operations, CRS defines hazardous material as a material containing any percentage of asbestos; and

WHEREAS, Regulated Asbestos Containing Material (RACM) and Non-RACM will be accepted for disposal at the monofill in accordance with all applicable federal and state regulations for packaging, labeling, transport handling and disposal; and

WHERAS, materials that can be accepted at this monofill are described in the State of Alaska's Solid Waste Regulations, 18 AAC 60; and

WHEREAS, the Plan of Operations submitted to ADEC will prevent hazardous waste, as defined by the Federal government (40 CFR 261.3) from being placed in the monofill; and

WHEREAS, testing for potential contaminants from the waste has occurred; and

WHEREAS, leachate modeling identified two potential contaminants of concern: sulfate and manganese. The results predict that the analytes will likely comply with the ADEC's drinking water standards; and

WHEREAS, baseline data for water quality has been provided; and

WHEREAS, the site is less than one mile from the Palmer Hay Flats Refuge, which is a major migratory bird refuge in Southcentral Alaska; and

WHEREAS, with conditions, the proposed monofill should not be harmful to the public health, safety, convenience, and welfare; and

WHEREAS, ADEC regulations require that monofill waste be set back a minimum of 50 feet from all property lines; and

WHEREAS, no material will be placed or stockpiled within 25 feet of the industrial ponds on the site; and

WHEREAS, no waste will be placed within 100 feet of the industrial ponds on the site; and

WHEREAS, in addition to the monofill, two storage or shop buildings, a scale house, and field office are proposed for the site; and

WHEREAS, the site plan depicts the proposed structures in compliance with setback requirements; and

WHEREAS, the operation will be required to comply with the maximum permissible sound level limits in MSB Code, per the requirements of MSB 17.61.080 - Noise Standards and MSB 8.52 - Noise, Amplified Sounds, and Vibration; and

WHEREAS, the driveway to the site will be secured with a locked gate; and

WHEREAS, the site is monitored with camera security systems; and

WHEREAS, only approved contractors will be allowed to bring material to the facility. This is controlled by gates and on-site personnel that will inspect all loads delivered to the facility; and

WHEREAS, the public will not be allowed to drop off or dispose of material at the monofill; and

WHEREAS, the sale yard will be open to the public with controlled access; and

WHEREAS, with conditions, there will be adequate safeguards in place to prevent blowing debris and incidental trash onto adjacent properties and roadways. Additional conditions will be

set regarding the handling and storage of materials during wind events; and

WHEREAS, the application material adequately addresses the impacts of the climate, geology, hydrology and geography of the site and the impacts to surrounding land uses; and

WHEREAS, the conditional use does fulfill all other requirements of this chapter; and

WHEREAS, screening of the site will be accomplished by using the existing topography and berms, building up berms and installing site obscuring fencing.

NOW, THEREFORE, BE IT RESOLVED, that the Matanuska-Susitna Borough Planning Commission hereby finds this application does meet the standards of MSB 17.60.100 and 17.60.110 and hereby approves the conditional use permit for the operation of a monofill for the disposal of inert construction and demolition debris, including Regulated Asbestos-Containing Material (RACM) and Non-Regulated Asbestos-Containing Material (Non-RACM) and an outdoor storage yard for the sale of salvageable/recyclable materials on parcels 17N02E18C010 and 17N02E19B006 with the following conditions:

1. It is the responsibility of the property owner and operator to identify and comply with all applicable local, state, and federal regulations applicable to

this development and obtain all necessary authorizations and permits and update as appropriate.

2. Upon issuance of a permit under MSB Chapter 17.60, the permittee shall provide and maintain all necessary documentation to demonstrate continued compliance with permit conditions.

3. The property owner and the permittee shall be responsible for maintaining all aspects of the operation, improvements, and development, and the site in compliance with the terms and conditions of the permit and all applicable local, state, and federal requirements.

4. Authorized representative of the borough shall be allowed to inspect the site at reasonable times for the purpose of monitoring compliance with all permit conditions. Upon reasonable notice from the Borough, the permittee shall provide necessary assistance to facilitate authorized inspections.

5. Except as otherwise specified by code, the privileges and requirements of a conditional use permit shall run with the land, subject to the following requirements: Within 90 days of recording the transfer of ownership of the subject land, the new owner shall provide written notification and a signed acknowledgement that

the new owner assumes responsibility for compliance with the requirements of the permit.

6. If the operation expands or alters, an amendment to the conditional use permit shall be required.

7. The operation shall be limited to what is described in the development plan submitted to the Matanuska-Susitna Borough and the Plan of Operations submitted to the Alaska Department of Environmental Conservation.

8. An area no larger than 120' x 50' shall remain uncompacted at any one time.

9. The maximum square footage that shall be exposed and not covered at any one time during the monofill operation shall be 25,000 square feet.

10. At a minimum, the monofill material shall be covered with soil weekly.

11. Immediately after the tire bales used for the side walls are installed they shall be covered with topsoil and seeded for revegetation.

12. A remote weather station shall be installed at the site to monitor wind speed. The weather station shall be set up where the wind flows freely and is not influenced by nearby objects or topography.

13. When sustained wind conditions on the site exceed 10 mph, waste material shall not be deposited at the site.

14. When sustained wind speeds exceed 15 mph, all open areas shall be covered with soil, secured with tarps, or other appropriate measures until sustained winds decrease to less than 10 mph.

15. The applicant shall install catch fences downwind of active monofill cells at all times. The fencing mesh shall be a maximum of one inch (1") in size.

16. At the end of each day the stockpiled daily cover shall either be contained within a covered trailer or completely covered with tarps that are secured to ensure that material does not become airborne.

17. The site shall be monitored daily for windblown material. If materials are found to have blown off-site a corrective measures plan shall be submitted to the Borough for approval.

18. If material is windblown onto adjacent properties, reasonable attempts shall be made to obtain permission to gain access to these properties for debris removal

19. The site shall be visually screened on a year round basis from all traveled or public rights-of-way and

from the residential properties on the west side of the property.

20. The maximum finished elevation of the monofill shall not exceed 162 feet Above Sea Level.

21. Upon completion, the monofill shall be covered with two feet of topsoil, seeded, and sloped as described in the development plan.

22. Should the operation be modified as a result of the Glenn Highway Reconstruction Project, an updated site plan and plan of operations shall be submitted to the Borough.

23. The bottom of the monofill shall not be located closer than 10 feet above the seasonal high water table.

24. If it is found that groundwater has been contaminated, a corrective measures plan shall be submitted to the Borough for approval.

25. The Groundwater Monitoring Plan prepared for this site by TERRASAT, Inc., dated May 17, 2013, shall be implemented and maintained, except that a final laboratory report resulting from a release investigation shall be submitted to the Borough within 48 hours of receiving the report.

26. Materials that can be accepted at this monofill are described in the State of Alaska Solid Waste Regulations, 18 AAC 60.

27. The following materials shall not be accepted at this monofill: PCBs or other hazardous wastes, household waste, putrescible waste, liquids, compressed gas cylinders, batteries, appliances with CFC/HCFC, animal carcasses, and petroleum contaminated materials.

28. Materials brought to the facility that have not been previously inspected by qualified personnel shall be deposited onto an impermeable pad for inspection prior to being deposited in the active monofill cell.

29. If prohibited materials are found, they shall be properly handled and disposed of in accordance with all state and federal laws.

30. Regulated Asbestos Containing Material (RACM) and Non-RACM shall be handled and disposed of at the site in accordance with state and federal regulations for packaging, labeling, transport handling and disposal.

31. Monofill waste shall be set back a minimum of 50 feet from all property lines.

32. No waste shall be placed or stockpiled within 100 feet of the industrial ponds on the site.

33. Only previously approved haulers shall be allowed to bring material to the facility.

34. The operation shall comply with the maximum permissible sound level limits allowed in MSB Code, per the requirements of MSB 17.61.080 - Noise Standards and MSB 8.52 – Noise, Amplified Sounds, and Vibration.

35. The site shall be gated and locked when not in operation. All visitors to the site must check in with personnel.

36. Hours of operation shall be limited to 7 a.m. to 7 p.m., Monday through Saturday, May through September and 8 a.m. to 5 p.m., Monday through Saturday, October through April.

37. Environmental and Pollution Insurance shall be maintained in the amount of $1 million single with a minimum $5 million aggregate.

38. This conditional use permit shall expire December 31, 2045.

39. The owner shall provide copies of all permits issued by state and federal agencies to the Matanuska-Susitna Borough prior to commencement of the permitted use. The owner shall also provide to the borough a copy of

every application for an amendment to any such permit at the time the application is filed with the permitting agency, and a copy of any amendment approved by the permitting agency shall be provided to the borough within five days of issuance.

40. This permit has been approved by the Matanuska-Susitna Borough Planning Commission. The decision may be appealed within 21 days of the date of approval by the Planning Commission in accordance with MSB 15.39 – Board of Adjustment and Appeals.

ADOPTED by the Matanuska-Susitna Borough Planning Commission this ___ day of ___, 2014.

PLANNING COMMISSION
RESOLUTION NO. 13-30(AM)

MATANUSKA-SUSITNA BOROUGH
PLANNING COMMISSION RESOLUTION NO. 13-30 (Am)

A RESOLUTION OF THE MATANUSKA-SUSITNA BOROUGH PLANNING COMMISSION ADOPTING FINDINGS OF FACT AND CONCLUSIONS TO SUPPORT THEIR FAILURE TO APPROVE RESOLUTION 13-22.

WHEREAS, Resolution 13-22 recommended approval of a conditional use permit for the operation by Central Monofill Services (CMS) of an inert material monofill on parcels 17N02E18C010 and 17N02E19B006, within Township 17 North, Range 2 East, Sections 18 and 19, Seward Meridian; and

WHEREAS, Resolution 13-30 contains findings of fact and conclusions of law which support denial of the conditional use permit; and

WHEREAS, on June 3, 2013, the Planning Commission held a public hearing on Resolution 13-22; and

WHEREAS, the Planning Commission's vote on the motion failed to garner a majority vote on June 3, 2013; and

NOW, THEREFORE, BE IT RESOLVED, that the Matanuska-Susitna Borough Planning Commission denied the conditional use permit based on the following findings of fact and conclusions of law:

1. Borough staff has documented trash and the Daily Cover (screened fines) that have blown from the monofill onto adjacent properties.

2. Borough staff has documented trash and/or the Daily Cover blown over the 40 foot hill on the west side of the property.

3. ADEC regulations (18 AAC 60.420(2)) states a monofill must be operated so that litter is controlled by fencing or another approved means, and is removed from access roadways and other areas in the facility.

4. This region experiences frequent multiple-day high-wind events each year since it is at the confluence of the Matanuska and Knik River valleys. Loose debris and dust from the fill has and is expected to continue to scatter beyond the boundaries of the site.

5. Fencing is not expected to contain the trash and/or the Daily Cover/screened fines on the site. The trash and/or Daily Cover/screened fines will get blown into the trees and surrounding properties.

6. CMS has not provided adequate mitigation plans for preventing trash and debris from leaving the site.

7. The Daily Cover/screened fines consist of shredded materials that are less than two inches in size. Material this size is easily distributed by the wind.

8. The inert debris that will be deposited on the site will be shredded into pieces 12 inches or smaller. Material this size can also become windblown.

9. The previous use of this site was for earth materials extraction. There are pre-existing legal nonconforming use rights for earth materials extraction for this property, which means that the industrial use was not approved under the current regulatory structure or evaluated for compatibility with surrounding land uses.

10. The proposed monofill is an industrial use and is an incompatible use with the surrounding residential areas as it cannot be completely screened from the surrounding residences to the west, debris from the monofill will blow onto the surrounding residences and roadways, and there is the possibility of contamination of drinking water wells in the area.

11. The final height of the monofill is proposed to be at 150 feet above sea level (ASL). The proposed monofill will have 2700 feet of frontage along the Glenn Highway. The proposed completed height of the monofill will be 35 to 40 feet above the adjacent berms on the southwest perimeter of the site.

12. The monofill will be unsightly from the Glenn Highway, and from the surrounding properties, including the residential subdivision directly to the west. It is not possible to completely screen the monofill because of topography and because the project is proposed to be 150 feet (ASL) high at completion.

13. The proposed monofill is inconsistent with some of the land use goals and policies of the Borough-Wide Comprehensive Plan (2005 Update) and the monofill is an industrial use and incompatible with the neighboring residential areas.

14. The proposed monofill is inconsistent with some of the goals and policies of the Borough-Wide Comprehensive Plan (2005 Update) and the Core Area Comprehensive Plan (2007) as there is the potential for groundwater contamination that could have negative effects on drinking water and surface water quality.

15. The proposed monofill is inconsistent with the goals and policies of the Borough-Wide Comprehensive Plan (2005 Update) and the Core Area Comprehensive Plan (2007 Update)

16. The proposed monofill will not preserve and will detract from the value, character, and integrity of the surrounding area as the monofill will be unsightly from the Glenn Highway and from the surrounding properties including the residential subdivision directly to the west. It is not possible to completely screen the monofill because of topography and because the project is proposed to be 150 feet (ASL) high at completion. Conditions may be set to address trash and debris containment on the site (17.60.100(B)(1)).

17. Comments received regarding the proposed monofill raised the following concerns:
    - Dumping of material without MSB or ADEC permits.

- Dumping of hazardous waste
- Trash in the water
- Water pollution
- Health problems
- Pollution of surrounding lakes
- Protection of watershed and aquifer
- Compromising the aquifer
- Windblown unhealthy dust and particulates from the monofill
- Pollution of drinking water
- Windblown materials/debris onto surrounding properties
- Impact on downstream waterways
- Long term safety of water quality
- Contamination of water table
- Use the existing landfill for disposal of material
- Previous problems with gravel extraction on this property and rising water table
- Trash in the trees is an eyesore
- Breaching of berm between two of the manmade lakes and impact on surrounding water levels
- Long term impact of contamination of drinking water
- Disregard for lakes, streams, and drinking water
- Lack of oversight and planning
- Lack of CMS's ability to manage and provide oversight of the facility
- Concerns about reclamation of the property
- Dumping of garbage/monofill near standing water
- High wind area will cover surrounding area with dust and debris from monofill
- Contamination of soil
- Residents are entitled to clean air, land and water
- Lowering of property values
- The Glenn Highway is a Scenic Byway
- Threat to migratory and breeding birds
- How the redesign of the Glenn Highway will affect this site

- Rising water level of Canoe Lake due to dam breach
- Concerns about asbestos being dumped at this site
- Concerns about lead based paint, mercury and heavy metals deposited in the monofill
- Too close to residential area

18. The monofill will be unlined.

19. Materials brought to the site will not be deposited on an impermeable surface that will contain any prohibited and/or contaminated materials.

20. No system is proposed to capture, treat, or monitor leachate leaving the site.

21. Alaska Department of Environmental Conservation (ADEC) regulations state that an unlined landfill may not be located closer than 10 feet above the highest measured level of an aquifer of resource value unless the landfill is constructed two feet or more above the natural ground surface (18 AAC 60.217).

22. The applicant has not addressed how they will monitor or manage the seasonal high water table fluctuations to ensure that the bottom of the monofill is not annually saturated by groundwater.

23. Soils in the area of the monofill site are very porous, loose gravels and glacial loess, and offer little or no filtering capacity for fluids being emitted or drained from the fill. Without a liner, a ten foot separation is not sufficient to prevent leachate from reaching the water table increasing the risk of potential contamination of the water resources in the area.

24. Contaminants typically found in groundwater surrounding construction and demolition landfills include cadmium, lead, iron, manganese, several chlorinated volatile organic compounds, sulfate, hydrogen sulfide, and TDS (Total Dissolved Solids). Chromium and arsenic are found if chrominated copper arsenate-treated wood is disposed in the landfill.

25. The site appears to be up gradient of the groundwater flow direction from private drinking water wells. Without a Fate and Transport Model for compounds of concern to evaluate the risk posed by the proposed monofill to down gradient wells, there is no way to evaluate if these compounds will reach the drinking water wells at concentrations posing risk to health.

26. Baseline data for water quality has not been provided.

27. Seasonal water table elevation fluctuations have not been established.

28. The top of the completed monofill drops 40 feet from one end to the other. The run-off from this slope could pose problems with the dredge ponds at the base of the monofill causing problems with the aquifer.

29. Migratory birds, especially waterfowl, are attracted to the ponds already on the site. Material used as daily cover includes material potentially hazardous to birds if ingested.

30. This site is less than one mile from the Palmer Hay Flats Refuge, which is the major migratory bird refuge in Southcentral Alaska.

31. It is not possible to set conditions to adequately protect the groundwater and aquifer from anticipated negative effects of the monofill. The stormwater management proposed by the applicant will maximize the volume of water infiltrating the monofill. This infiltrating meltwater and rainfall will percolate through the placed materials, enter the groundwater and a large unconfined aquifer. The leachate from the construction and debris monofill may contain compounds at concentrations above drinking water standards. That water will impact private and public water wells used by homes, neighborhoods and farms, and could also enter nearby lakes that are heavily used. Adequate baseline water quality data monitoring to establish the quality of the existing water, the level of the groundwater throughout the monofill site, and the porosity of the materials under the monofill, has not been provided.

32. The proposed monofill will be harmful to the public health, safety, convenience, and welfare (17.60.100(B)(2)).

33. The site plan depicts the proposed structures in compliance with setback requirements.

34. The application minimally addresses the impacts of the climate, geology, hydrology and geography of the site and the impacts to surrounding land uses.

35. According to documentation and studies the proposed monofill site is located where the topography, geology, hydrology and soil are inadequate for protection of ground and surface water quality.

36. The conditional use does not fulfill all other requirements of this chapter (17.60.100(B)(4)).

37. The berm adjacent to the Glenn Highway will have to extend in height in order to obscure the view of the monofill from the highway.

BE IT FUTHER RESOLVED that this is a final determination which may be appealed in accordance with MSB 15.39.140 by filing a written notice of appeal with the Borough Clerk within 21 days from the date this determination was issued. If an appeal is not filed as described in the preceding sentence, the right to appeal is forfeited.

ADOPTED by the Matanuska-Susitna Borough Planning Commission this 17th day of June, 2013.

Potential Hydrologic Effects of Gravel Extraction

South of Palmer, Alaska

Executive Summary

Past and possible future gravel extraction in an area south of Palmer, Alaska, have created concerns about potential effects on nearby water wells serving individual residences and public water systems and potential hydrologic effects on other resources. This report examines available geologic and water resources data, along with current gravel extraction plans by major operators, to determine if any significant hydrologic effects may result from the planned activities.

Three hydrogeologic cross sections show that water is obtained from a thick and widely present alluvial and glacial outwash aquifer that is also mined for gravel. Several lakes in the project area are considered to be in good hydraulic connection with the aquifer. Most wells only tap into the upper portion of the aquifer and are reported to have standing columns of water under static conditions of 10 to 30 feet.

One of the lakes to be created by gravel extraction is projected to extend into the Matanuska River braidplain, and is projected to equilibrate close to the current level of the water table in the braidplain. That lake will extend into the adjacent uplands where the current water table position is approximately 30 feet higher than the projected lake level. This is expected to lower water levels in the aquifer in the vicinity of the lake. A simple mathematical model was applied to the mining scenario and surrounding aquifer to estimate the extent and magnitude of potential water-level declines. Model calculations indicate that water levels may decline up to several feet at a distance of 1.5 miles or more northward from the planned lake. The magnitude and extent of these potential declines, as well as future planned lakes, are shown on the cross sections.

The amount of water-level decline is likely to cause some wells to fail as a result of the water table dropping to levels near or below the bottom of the well. Other wells may experience reduced yields or sporadic outages. Additional information is needed in order to determine the potential number and locations of wells that may be affected and the likely effects on any specific well.

Additional wells may have capture zones that overlap areas subject to gravel mining and the water-supply aquifer may be subject to risks of water quality impairment; however the degree of risk associated with this is not determinable with existing information.

The surface of Meirs Lake is expected to be lowered by approximately six feet as a result of the planned extraction, and other lakes may also experience observable declines. The plans include mining through a stream in the Matanuska River braidplain listed in the ADF&G Anadromous Waters Catalog as rearing habitat for Coho salmon. Well and lake water is currently used for irrigating farmland, and there are a number of

public water systems in the area. It is not known whether the lower water levels would have an effect on those systems.

To mitigate the effects of water-level declines, most wells could probably be deepened or redrilled to deeper parts of the aquifer to restore sufficient yield. Also, reducing the extent of planned gravel mining is expected to reduce the extent and magnitude of water-level declines.

Acknowledgements

The Matanuska-Susitna Borough provided funding for this study and also provided aerial imagery, assistance in determining well locations, and graphical support for report figures. We would also like to thank and acknowledge Alaska Department of Natural Resources Hydrologist Roy Ireland and Alaska Department of Environmental Conservation Hydrologist Charley Palmer for providing helpful technical review comments that improved the report, although this does not suggest or imply concurrence with the findings of the report.

Introduction

Background

Gravel mining has occurred south of Palmer, Alaska, along both sides of the Glenn Highway for decades. Much of the gravel is shipped to Anchorage via the Alaska Railroad for general construction purposes. Land surrounding the gravel pits consists of agricultural, residential, state park land, and the braidplain of the Matanuska River. Water supplies for residential areas are served by a combination of on-site wells and small- to medium-sized public water systems based on wells. Concerns have risen in recent years with an increased number of private wells in the vicinity of the gravel pits and the release of plans by the pit operators detailing wider and deeper extraction of gravel and the creation of ponds and lakes. Several ponds have been created in recent years, with some history of changes in water levels in the area caused by gravel extraction activities (Brailey Hydrologic Consultants, 2007).

Goal

The goal of this study is to determine if potential future mining scenarios may result in significant adverse effects. These effects include, but are not limited to, changes in water levels affecting current or future well owners, changes in water quality, or changes in water conditions affecting other structures or resources.

Methods

The project area for this study is a 12-square mile area generally bounded by the Alaska State Fairgrounds on the northeast, the Matanuska River braidplain on the southeast, Spring Creek on the south, Matanuska Lake on the southwest, and the Matanuska-Susitna College campus of the University of Alaska Anchorage on the northwest (figure 1). The project area includes gravel pits operated by the major gravel producers Anchorage Sand and Gravel, Inc., on the north side of the Glenn Highway,

and Granite Construction Company on both the north and south sides of the highway. Quality Asphalt Paving also operates a pit on the south side of the highway.

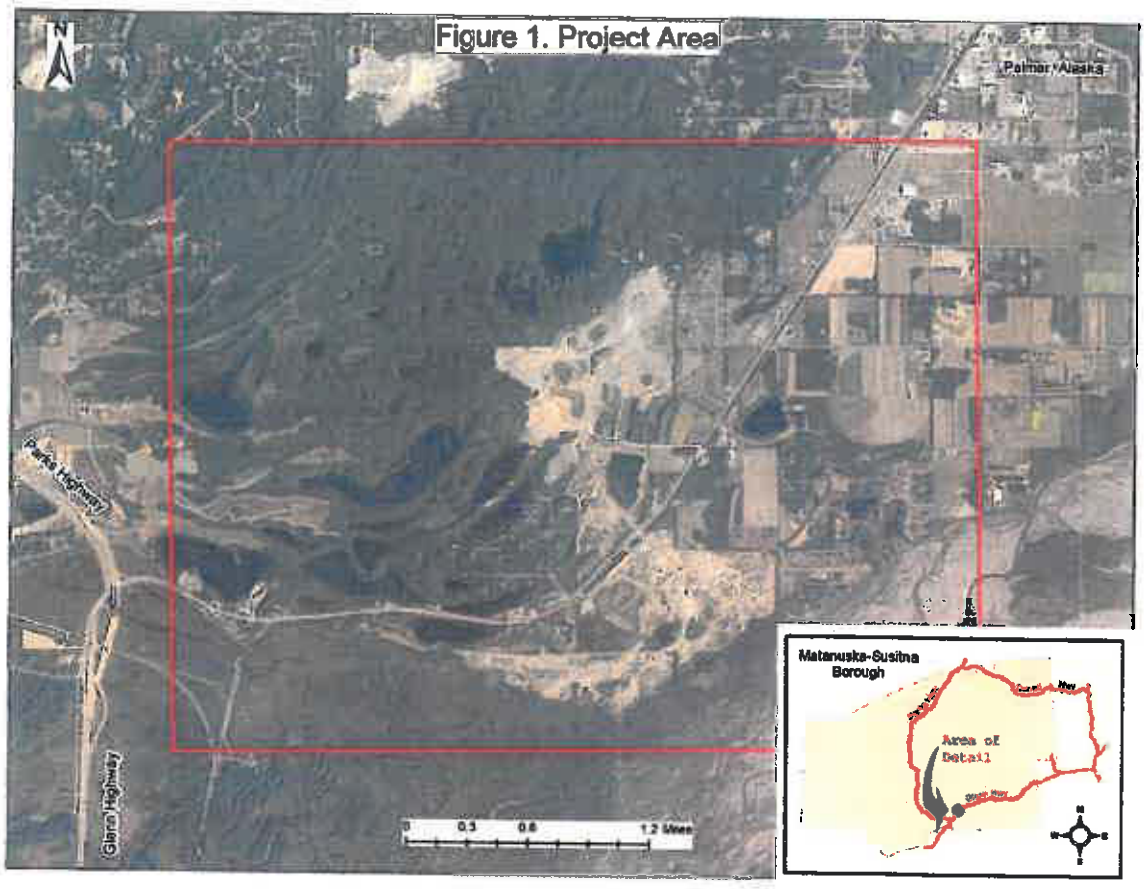

Figure 1. Location of the project area.

This study reviews recent reports and water-well databases and presents a conceptual model of surface water and groundwater flow systems for the project area. Hydrogeologic cross sections based on water-well logs and geologic information are presented and used to illustrate and define groundwater resources.

A composite potential future gravel extraction scenario is constructed from existing conditions and plans and documents provided to the Borough by the operators. This scenario is then superimposed on the cross sections to analyze and illustrate what potential future hydrogeologic conditions may occur. A simple mathematical model is used to estimate the extent of water level changes caused by the scenario. Potential effects of the hydrologic changes are described, and suggestions for future work are presented. This report contains numerous technical terms that are defined in a glossary section at the end of the report.

Geologic Setting

The surface geology of the project area has been largely influenced by the most recent glacial advance through the area, known as the Naptowne advance of the Matanuska Glacier (Reger and Updike, 1993). The retreat of this glacier left behind four predominant geomorphic landforms in the project area.

Palmer Terrace

The Palmer Terrace, along the Glenn Highway south of Palmer, is a gently sloping plain of pitted glacial sand and gravel outwash. The terrace contains several natural kettle lakes or depressions formed by melting blocks of glacial ice that were buried during sediment accumulation. The surface of the terrace is 25 to 50 feet above the current braidplain of the Matanuska River. The largest kettle lake is variably known as McLeod Lake or Meirs Lake (hereafter referred to as Meirs Lake) located near the intersection of Outer Springer Loop Road and the Glenn Highway.

Crevasse-fill-ridge complex

During the late stages of glacial ice cover, open crevasses in the ice were present in what is now known as the Kepler-Bradley Lakes area. These crevasses were filled with accumulations of alluvial sands and gravels that now stand as arcuate ridges adjacent to valleys and lakes where the ice has melted away.

Kame/esker complex

On the north side of the crevasse-fill-ridge complex and in the north-central part of the study area, a region of more irregular hills and valleys known as a kame/esker complex is present. The geologic materials in this area are also predominantly sand and gravel resulting from ice stagnation and waterborne sedimentation processes.

Matanuska River braidplain

The current braidplain of the Matanuska River is incised into the Palmer Terrace. The braidplain predominantly contains sand and gravel deposits associated with the current or recently active migrating channels of the Matanuska River.

Other geologic materials. Glacial drift, including glacial tills, are present in some areas beneath the fluvial and glaciofluvial deposits described above (LaSage, 1992). Sedimentary, metamorphic and perhaps igneous rocks underlie the unconsolidated glaciofluvial and till deposits. Thickness of the unconsolidated deposits ranges from 0 to over 200 feet in the project area. Up to several feet of windblown silty loess mantle the study area.

Hydrology and Hydrogeology

Conceptual model

Moran and Solin (2006), Brailey Hydrologic Consultants (2007), LaSage (1992), and Jokela and others (1990) provide a framework for a conceptual model of surface water

and groundwater flow systems for the area. A dominant hydrologic feature in the project area is the Matanuska River. The river floods seasonally and the main channel is capable of migrating across the braidplain over time. A dike extends southward from the southern extent of the gravel pit workings south of the Glenn Highway. This dike separates the Matanuska River braidplain channels on the east from the Spring Creek bottomland on the west. Except for Spring Creek and other bottomland sloughs and streams, there are no other significant creeks or streams in the project area. Soils throughout the study area are relatively permeable and rainfall and snowmelt tend to infiltrate into the ground to provide recharge to groundwater.

Groundwater in the study area generally flows from north to south from the foothills of the Talkeetna Mountains to discharge areas along the Matanuska River and its contributing sloughs and tributaries.

Numerous closed-basin lakes (meaning that the lake has no surface water outlet) are present in the study area. These include kettle lakes such as Meirs Lake in the pitted outwash of the Palmer Terrace and long, narrow arcuate lakes between the crevasse-fill ridges in the Kepler-Bradley Lakes area. Of the lake types described by Jokela and others (1990) these lakes are most likely groundwater flow-through type lakes, receiving groundwater inflow on the upgradient side of the lake and contributing lake water to the groundwater system on the downgradient side.

Aquifers. LaSage (1992) notes that groundwater in the area is obtained from both water-table (unconfined) and confined aquifers. Brailey Hydrologic Consultants (2007) note that most wells in their study area (including several up to approximately 100 ft deep) appeared to tap the unconfined aquifer. Jokela and others (1990) (including reference to earlier work by Trainer (1960)) note the presence of a confining unit and a confined aquifer east and north of the present study area. Previous studies also note the presence of a low-yield bedrock aquifer throughout the area beneath the other glacial or glaciofluvial deposits.

For the purposes of this study, two aquifers are defined. The alluvial or glacial outwash aquifer is the principal aquifer in the study area and is comprised predominantly of alluvial and glacial outwash sand and gravel. The aquifer occurs under water-table conditions throughout most of the study area, although localized areas where groundwater occurs under confined conditions are likely present. In these areas, the aquifer is confined by glacial till or other silty materials, however within the present study area, confining units or confined aquifers have not been delineated.

The aquifer thickness ranges from approximately 50 to 250 feet thick in most areas, although it may be somewhat thinner or thicker locally. There is one reported area where the bedrock surface is above the water table and the aquifer is absent (Brailey Hydrologic Consultants, 2007). Limited areas of silty glacial deposits are present that can locally limit groundwater flow to wells or produce steep water table gradients (Brailey Hydrologic Consultants, 2007). Yields of wells are adequate in most areas for domestic usage, with high-yield irrigation or public-supply wells constructed in some places. The quality of water is generally suitable for domestic supply or irrigation use

without treatment, and wells are widely used to support residential and agricultural development.

The bedrock aquifer is comprised of sedimentary, metamorphic, or igneous rocks (bedrock) that occur at depth through the study area. Well yields are typically low, although usually adequate for domestic supplies. Only a few wells in or near the present study area are known to have encountered bedrock.

Water-level fluctuations. Groundwater and lake levels in the study area fluctuate with changing precipitation trends, both seasonally and over longer periods. LaSage (1992), showed seasonal fluctuations in the long-term groundwater-level data, but no major long-term trends between 1949 and 1985. Recent data show that lake levels reached a relative peak in 2007 (Granite Construction Company, 2010, and Roy Ireland, ADNR, written communication, 2010). Munter (2008) reported a case of high groundwater levels attributed to abnormally high recharge in 2005 just a few miles north of the study area.

Water use. All household supplies of water within the study area, whether individual water systems or public-supply systems, are reportedly obtained from groundwater. Water is also obtained seasonally from wells and from Meirs Lake for irrigating farmland.

Well data

LaSage (1992) presents a thorough compilation of data from boreholes and wells in the project area available at the time. Since then, additional wells have been drilled, and some of these have been submitted to agencies and entered into the State of Alaska's primary well log database (WELTS). A few have also been added to the U.S. Geological Survey's database (NWIS). Both databases were queried and Figure 2 shows the resulting combined well data source used for this study. Figure 2 also shows locations of public water systems in the project area (Christopher C. Miller, Alaska Department of Environmental Conservation, written communication, 2010)

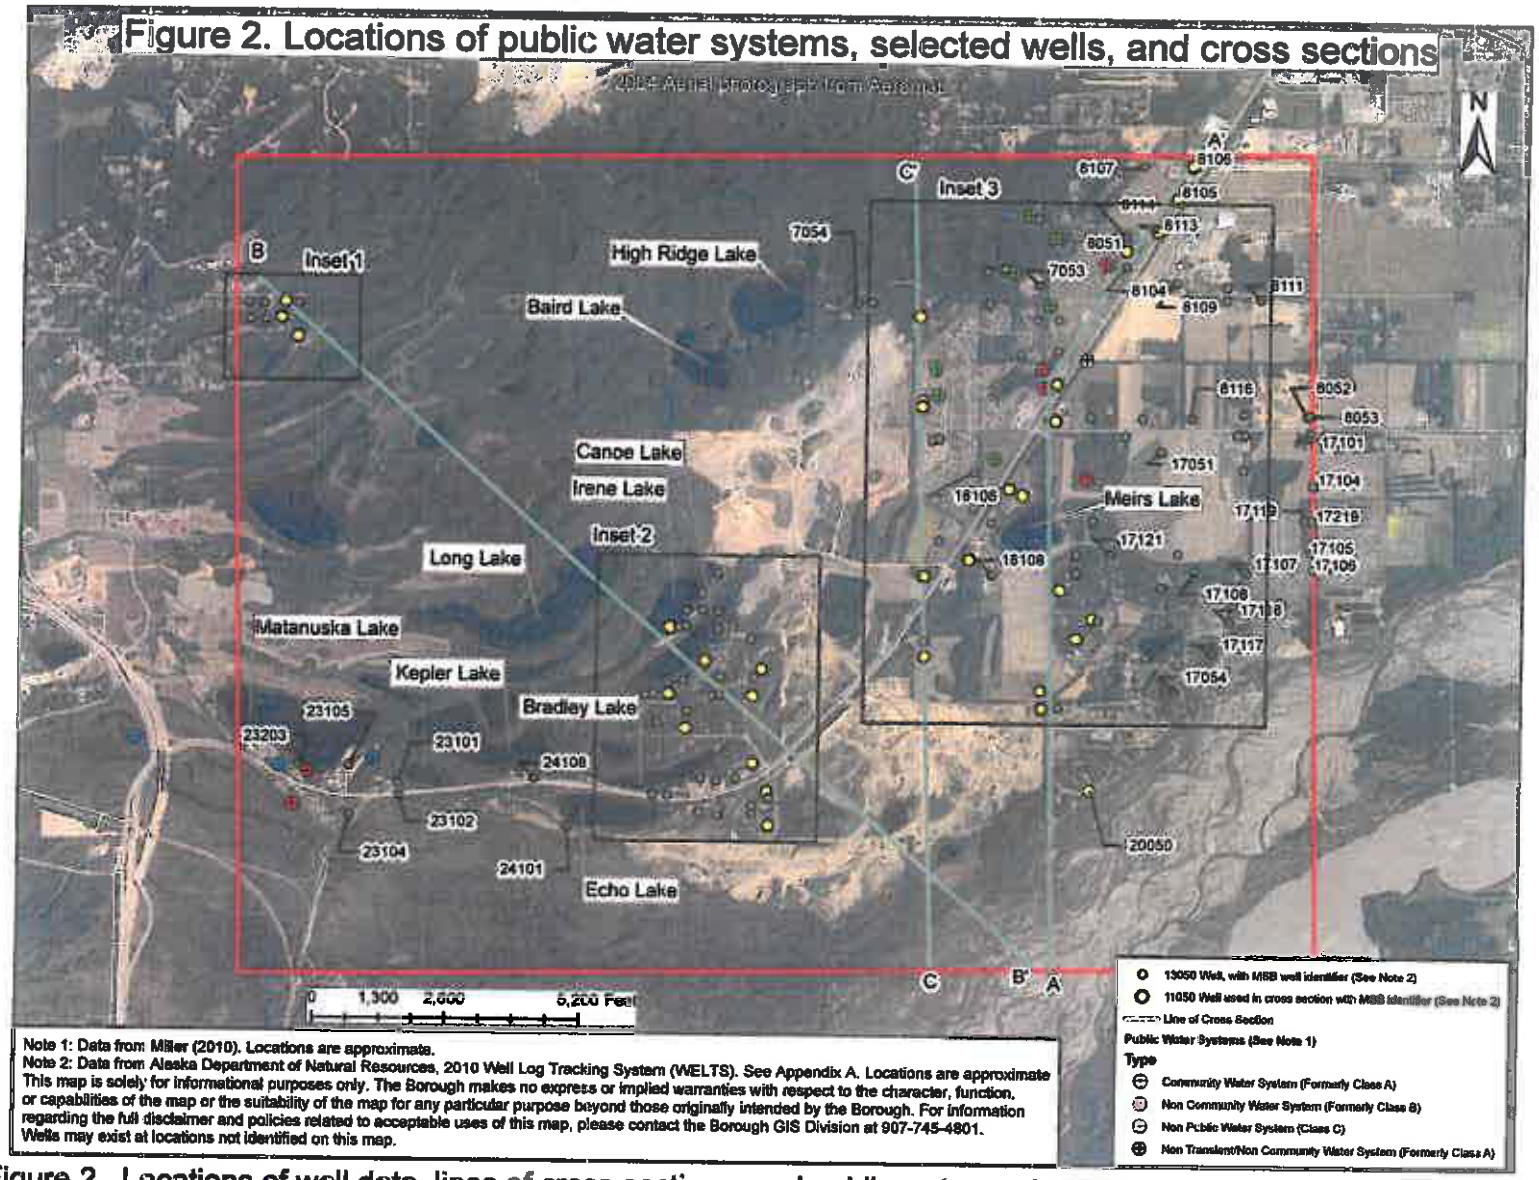

Figure 2. Locations of well data, lines of cross sections, and public water systems

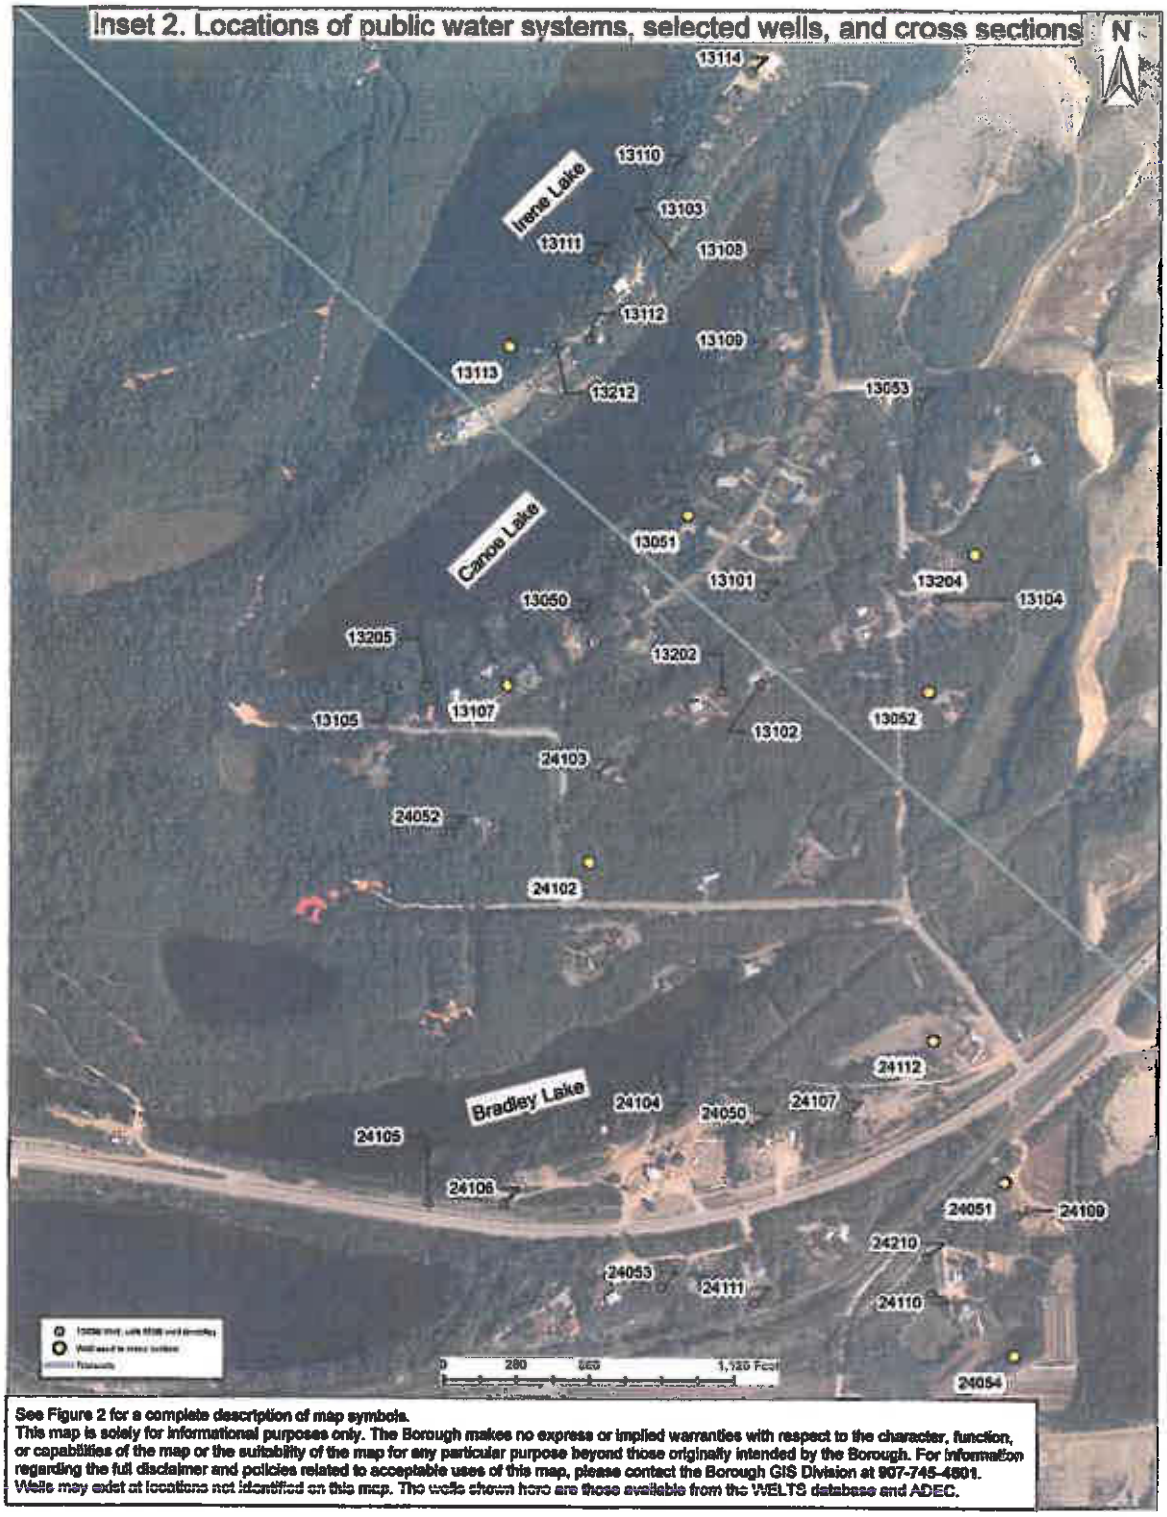
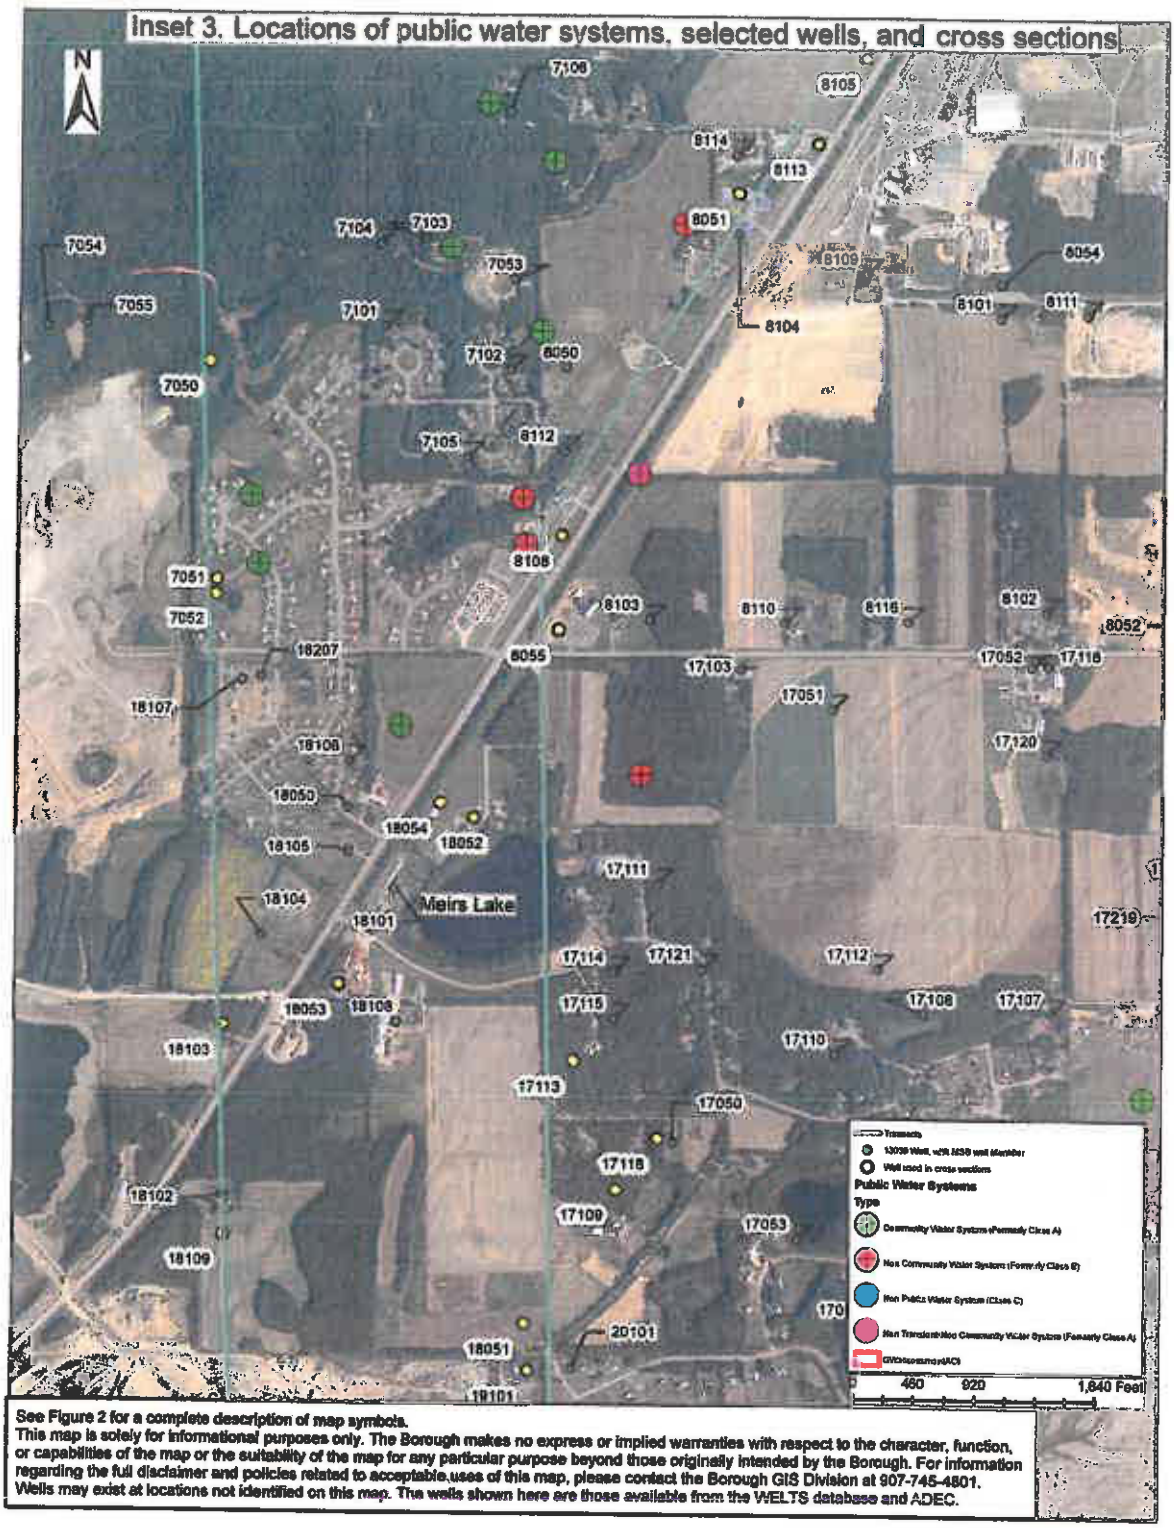
PLANNING COMMISSION NOVEMBER 7, 2016 Page 2270



Inset 2. Detail of Figure 2 in the central part of the study area.



Inset 3. Detail of Figure 2 in the eastern part of the study area.

A unique system of well numbering was developed for this project, and well identifiers are shown on Figure 2. A summary table of water-well data used for this report is presented in Appendix A. Electronic copies of individual well logs are generally available at the State of Alaska's WELTS database and physical copies are also available at the offices of the Matanuska-Susitna Borough in Palmer.

Hydrogeologic cross sections

Three cross sections were prepared along the lines shown in Figure 2. The cross sections were prepared using topographic data shown from the 1:25,000 scale U. S. Geological Survey topographic map for the area, which is based on aerial photography taken in 1972 and revised from aerial photography taken in 1986. The cross sections are drawn using actual horizontal and vertical scales (including a vertical exaggeration as noted on the sections) and depict the actual physical relationships of features shown, adjusted for the fact that some features shown are actually located slightly off of the actual line of cross section. The sections should be viewed in conjunction with map views of the same areas to understand the true three-dimensional relationships of the features shown.

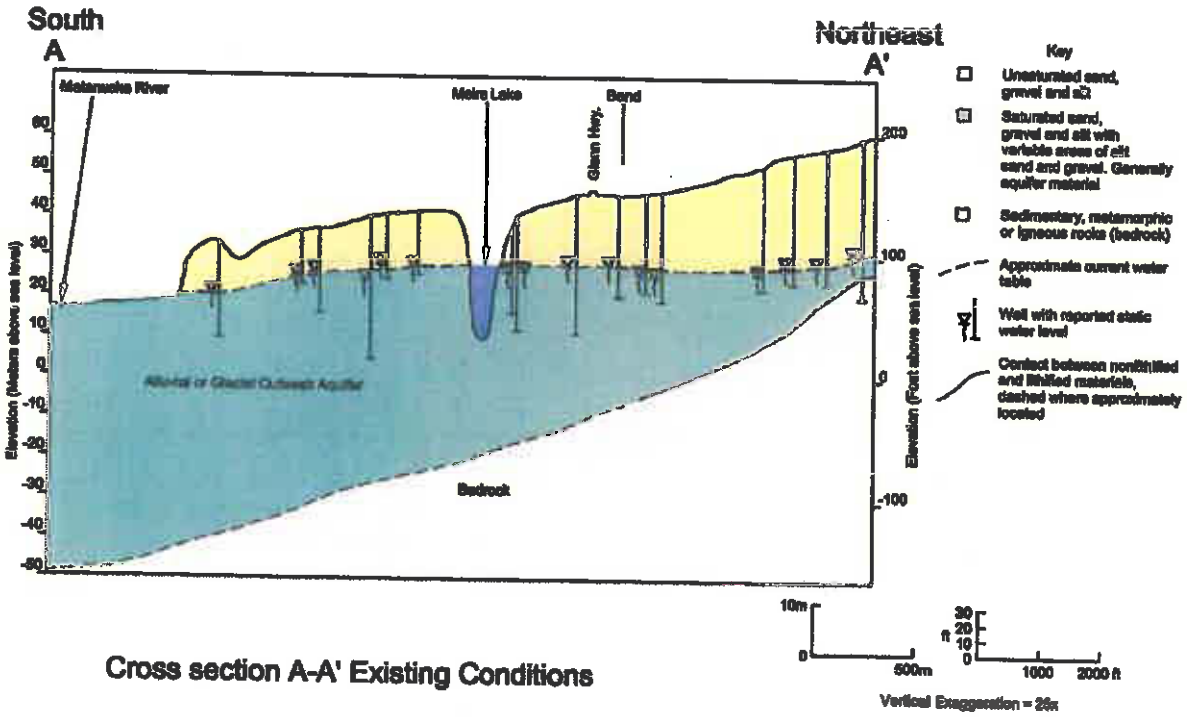
Well locations and elevation determinations. Well locations for all wells shown in the study area were determined from information provided by driller's reports, LaSage (1992), and from plat maps and property records provided by the Matanuska-Susitna Borough. Most wells were plotted in the middle of the fourth-order aliquot part of the section as was done by LaSage (1992). For wells used on the cross sections, land surface elevations were interpolated from the 1:25,000 USGS topographic map, which has 5-meter land surface elevation contour intervals in the study area. In most cases on the Palmer Terrace where the land surface is relatively flat, errors associated with the land surface determinations for the wells are likely in the range of 1-2 meters. Errors in the higher-relief areas of the crevasse-fill-ridge complex or the kame/esker complex could be approximately 5 meters.

These potential inaccuracies are a likely cause of apparent irregularities in the position of the water table in the cross sections. Other potential causes of the irregularities are seasonal or longer-term fluctuation in the water table, inaccuracies in driller's reports of the depth to water under static conditions, and the distance of wells from the line of cross section.

Considering the vertical and horizontal scales of the cross sections, the numerous surface water bodies with water-elevation data, the relatively large number of well logs available, and the areawide trends and large-scale features depicted, these irregularities are considered to be of minor importance. The irregularities are important for potential application of the study results to any specific well or location, which is discussed subsequently in this report.

Cross section A-A' (Figure 3) shows a gently sloping water table rising from the Matanuska River braidplain to Meirs Lake and beyond. The northeasternmost well in

the study area at the line of section reportedly encountered bedrock at a depth of 121 feet. Several wells just north and west of this well, but outside of the study area also reportedly encountered bedrock at similar depths.



Cross section A-A' Existing Conditions

Figure 3. Hydrogeologic cross section A-A'

The cross section shows that all other wells tap the sand and gravel aquifer. A few wells penetrate to depths of 50 or more feet below the water table, but most wells reportedly terminate with approximately 10 to 30 feet of water present in the bottom of the well under non-pumping (static) conditions.

Cross section B-B' (figure 4) illustrates conditions perpendicular to the curvilinear topographic trend of the crevasse-fill-ridge complex. Although this is an area of considerable local relief, the water table shows a relatively smooth profile through the study area. This is consistent with the abundance of sand and gravel noted in the well logs. The three wells located closest to the Matanuska River show lower water-table positions than the approximate water-table position drawn because they are located further off the line of section than most other wells and in a down-gradient direction. They were selected to help fill a data gap in this area.

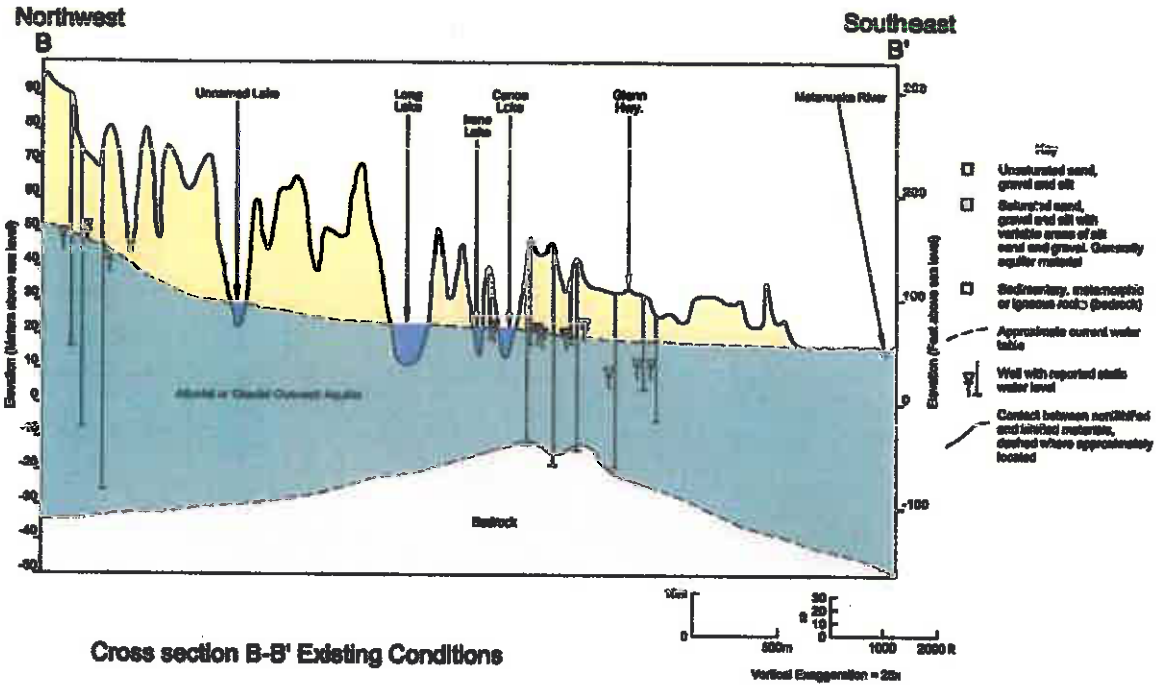


Figure 4. Hydrogeologic cross section B-B'

Three wells in the Canoe Lake area are shown to penetrate bedrock, providing information about the depth of bedrock in this area. These wells were perforated or screened in the unconsolidated materials.

Cross section C-C' (Figure 5) shows hydrogeologic conditions similar to cross section A-A'. The depth to bedrock is defined by several wells penetrating bedrock at depths of less than 100 feet just north of the study area. This line of section also shows the transition to the higher-relief topography of the kame-esker complex adjacent to the Palmer Terrace.

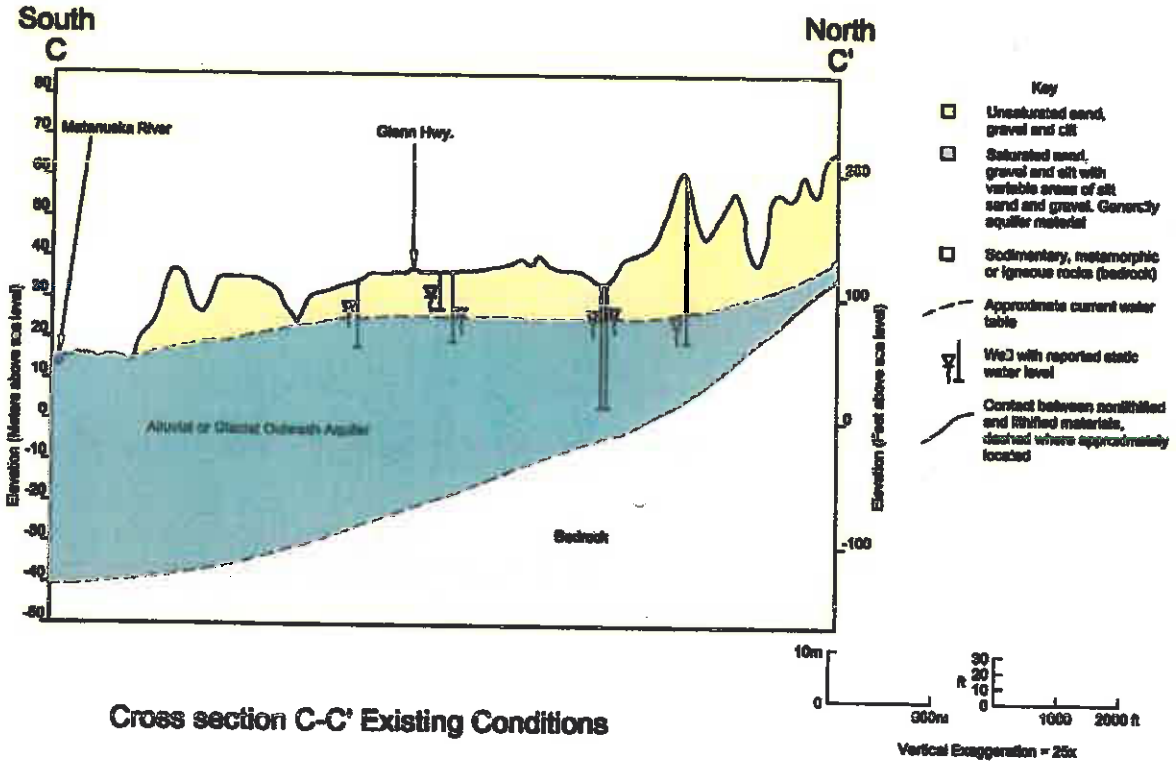

Figure 5. Hydrogeologic cross section C-C'

All hydrogeologic cross sections illustrate a position of the water table that can only be approximately determined for several reasons. First, water-level measurements in wells were collected over a period of many decades and during various seasons of the year and do not represent a single time-synchronous measurement of the water table position at a defined point in time. Also, as previously mentioned, land surface elevations at most well sites are only approximately known, which translates into uncertainty for the calculated water-table elevation at the well sites. Finally, hydrologic conditions in the area may have changed since preparation of the U. S. Geological Survey topographic map of the area (based on 1986 and earlier photography) as a result of gravel removal activities and the creation of existing ponds.

Despite these uncertainties, the abundant water-level data shown in the sections displays a degree of consistency that provides some confidence that the general trends observed are valid. The water-table position was compared to maps and data provided by Moran and Solin (2006), Jokela and others (1990), Ireland (2010), and Brailey Hydrologic Services (2007), and found to be generally concordant. Detailed water-table gradient data provided by Ireland (2010) and Brailey Hydrologic Services (2007) are generally too localized to be distinguishable on the cross sections or the cross sections are not oriented in the optimal direction to show the gradients, or both.

Potential Gravel Extraction Scenario

Several documents have been submitted to the Matanuska-Susitna Borough by gravel mining operations that provide some indication of potential future gravel extraction plans. A report by Brailey Hydrologic Consultants (2007) provides details about the plans at the Anchorage Sand & Gravel, Inc., property, and an assessment of the expected hydrologic effects of the planned work. Granite Construction Company (2010) provides documents describing the location and depths of planned gravel extraction for their operations. Recent aerial photography showing the approximate present (October 2009) extent of gravel extraction and pond development are also available.

Assumptions

In order to conduct this analysis, certain assumptions were made. Major assumptions are:

1. Existing ponds will not be filled in. Unless they are expanded or deepened, they are likely to remain as they are. Figure 6 shows the extent of the ponds based on aerial photography taken during October 2009.

2. Future expansion at Anchorage Sand & Gravel Inc. property will match the scenario described by Brailey Hydrologic Consultants (2007). This includes the excavation of a lake that extends approximately 1 mile long, up to 3000 feet wide, and up to 90 feet deep. This lake will be termed the north lake in this report.

3. Future expansion at the Granite Construction Company property will proceed in accordance with a letter and attachments from Granite Construction Company (2010) to the Matanuska-Susitna Borough. A lake will be excavated at the location shown in Figure 6. Excavation will occur to depths of 50 to 150 feet below existing land surface "depending on geology". This lake will be termed the south lake for this report.

Other assumptions are described in a subsequent section of this report. Figure 6 shows the compilation of existing ponds and potential future mining scenarios described above.

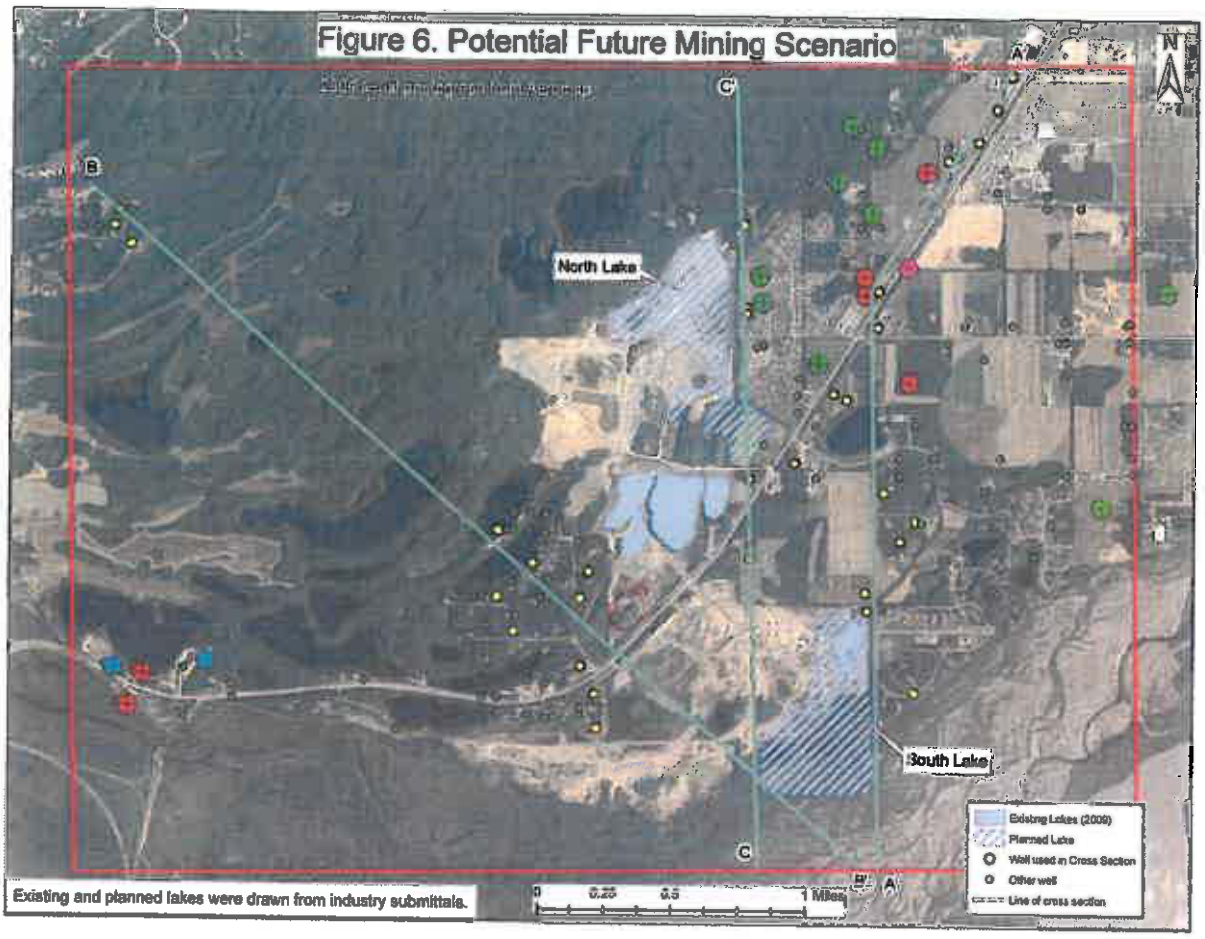

Figure 6. Potential future gravel mining scenario

Analysis

An important feature illustrated in Figure 6 is that gravel mining is planned to extend into the braidplain of the Matanuska River. This has several implications. First, although the current main channel of the river is located some distance away from the proposed lake, future channel migration could cause the main channel to shift back to the west bank of the braidplain (Missal, 2009), which could inundate the south lake.

Also, the U. S. Geological Survey (1992) topographic map of the project area shows a small stream of water flowing through the planned mining area that has an elevation at the southwest corner of the proposed lake of approximately 49 feet above sea level (converted from the map's 15 meter land surface contour interval where it crosses the stream). Streams in this area near the base of the Palmer Terrace are the result of groundwater discharge, meaning that the water-table elevation is very close to 49 feet above sea level there. This elevation is likely to constitute a base level for groundwater flow systems discharging to this area. Equilibration of the lake level to approximately 49 feet above sea level has implications that are described subsequently.

The potential future mining scenario was superimposed onto the three cross sections to provide an assessment of the likely effects of gravel extraction at these locations (Figures 7, 8, and 9). In these figures, the gravel extraction areas are projected onto the lines of section because the lines pass near, but not always directly through, areas to be mined. This is a common technique used for constructing cross sections, and approximations created by this projection are considered minor.

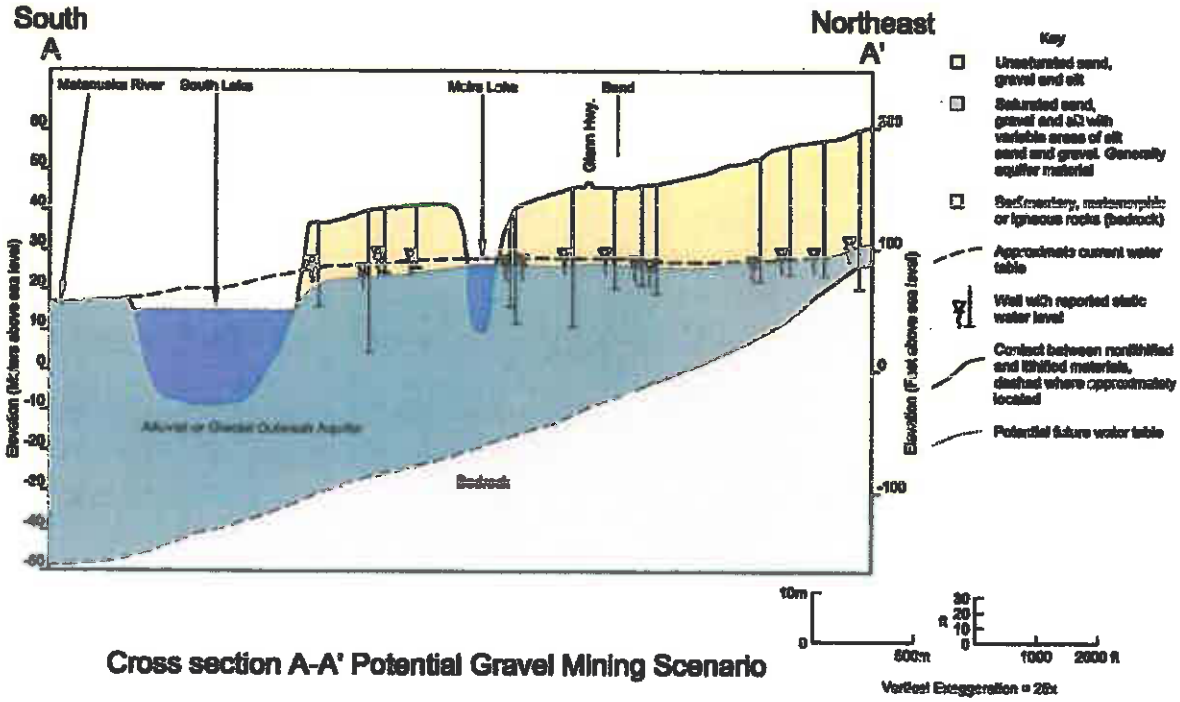

Figure 7. Hydrogeologic cross section A-A'; potential future gravel mining scenario

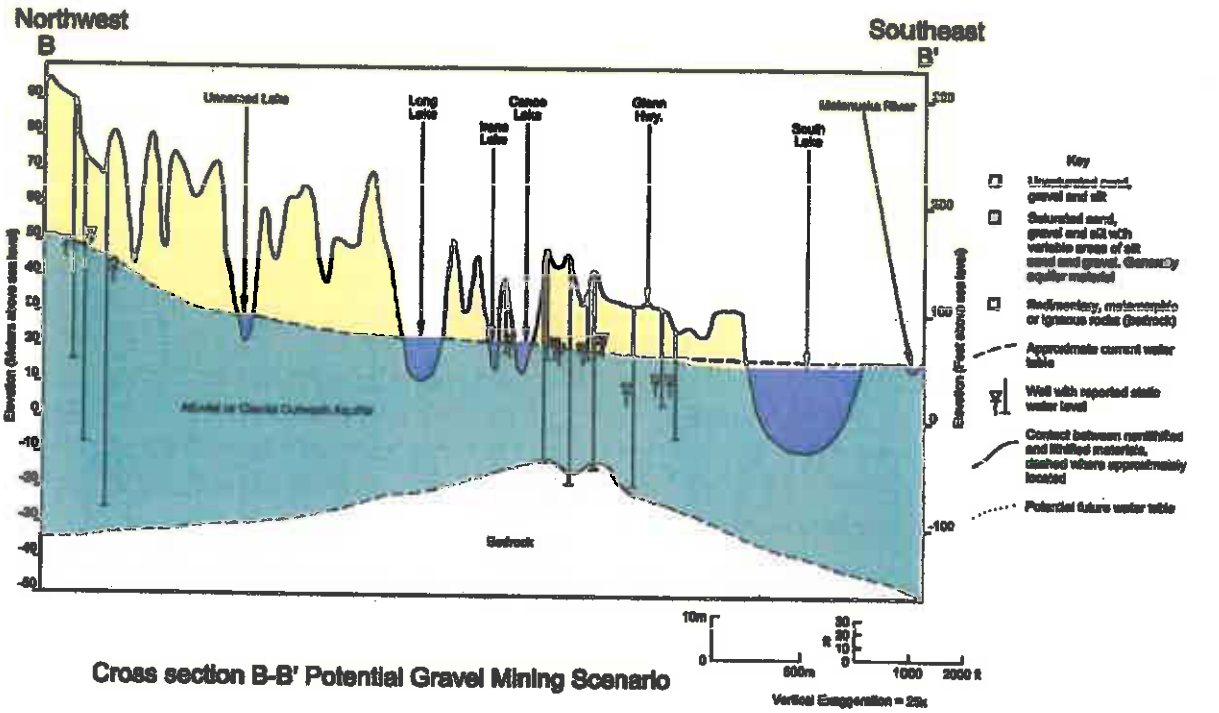

Figure 8. Hydrogeologic cross section B-B'; potential future gravel mining scenario

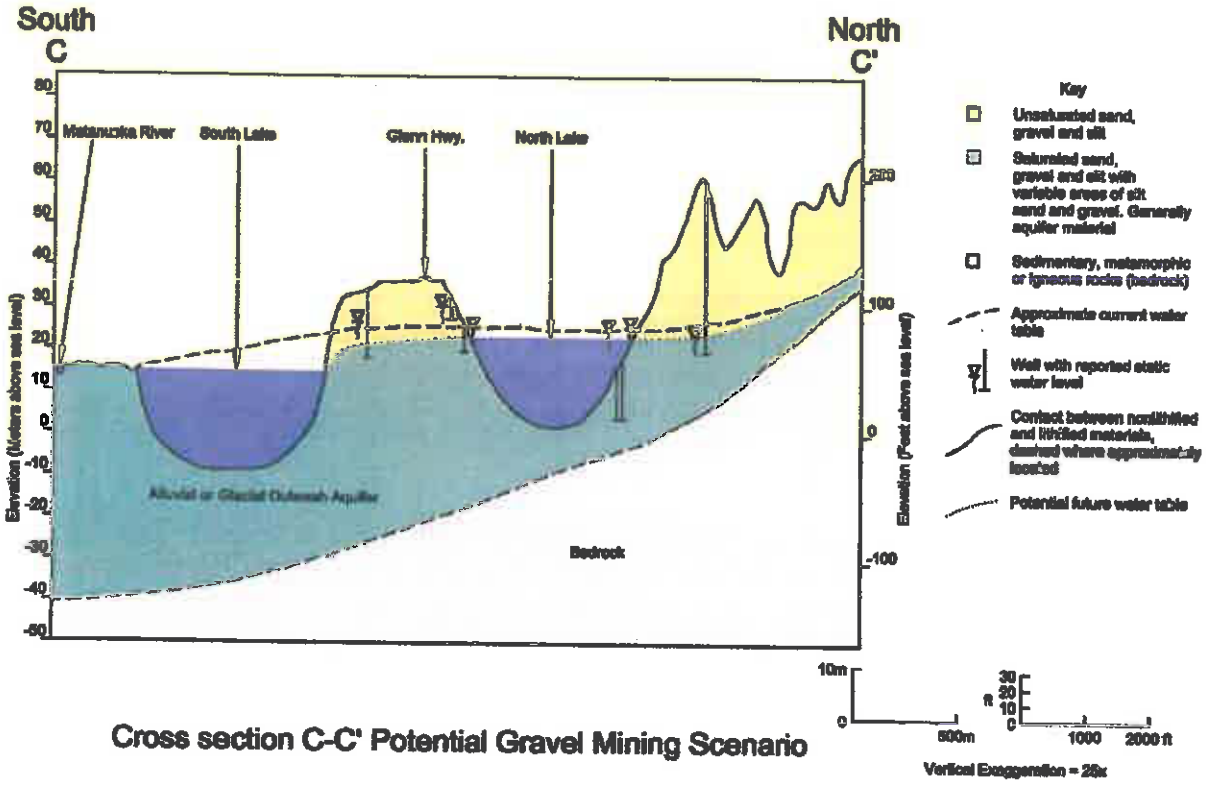

Figure 9. Hydrogeologic cross section C-C'; potential future gravel mining scenario

Potential water-quality effects. A review of Figure 2 and Figure 6 shows that several wells are located close enough to the proposed gravel mining areas that contaminants introduced into the aquifer could potentially reach the wells if the wells are located downgradient of the source of contamination. Also, capture zones of some of the wells could extend out into the gravel mining areas to draw in contaminants. With a general southward direction of flow in the study area, some nearby wells are likely to be located upgradient of the proposed mining area and would not be expected to be at risk of water quality impairments from the proposed operations. Because a detailed and reliable water-table map for entire area is not available, however, either for current conditions or post-mining conditions, it is difficult to evaluate groundwater flow directions in more detail. Therefore, in the absence of more detailed information, gravel extraction activities as proposed are considered to introduce a risk of impaired water quality to some existing and potential public drinking water aquifer sources. Detailed evaluation of groundwater flow direction for the entire area requires an accurate and detailed water-table map, which is not available.

Water-table declines. The cross sections show that construction of the lakes is projected to result in a lowering of the water table in the area. The most important hydrologic factor contributing to this lowering is the south lake because it extends out into the Matanuska River braidplain. The surface of the resulting lake is expected to closely match the water table in the braidplain, at approximately 49 feet elevation above sea level.

Because lakes have essentially flat water surfaces, this lowered elevation is expected to be transmitted to the aquifer on the north side of the lake where the current water table elevation is estimated to be approximately 79 feet above sea level (see Figure 7). This means that the water table will be lowered approximately 30 feet at this location, assuming a good hydraulic connection between the lake and the water table aquifer. The permeable alluvium at the site makes it likely that a good hydraulic connection will be present between the lake and the water-table aquifer.

In order to estimate the propagation of this lowered water table in a northward direction, a simple mathematical model was used. The model assumes that the lake behaves as a large diameter well, withdrawing water from the aquifer and discharging it to the river braidplain or the braidplain aquifer on the south or southwest side of the lake. Because of the amount of water draining from the aquifer into the south lake, a surface water outlet from the lake may form.

The model further assumes that the lake has been in place for one year. This means that transient changes to the flow system are minor and a new quasi-steady state flow system has been established. The model also assumes that the aquifer is isotropic and homogenous, is infinite in all directions, and that there are no significant boundary conditions nearby. This latter condition is not completely representative of field conditions, and will be addressed in a subsequent section of this report.

The mathematical model selected is the Theis (1935) model, which is a widely used and relatively simple method for estimating water-level declines at various locations in an aquifer caused by water extraction from a well. The model was first used to calculate

the discharge that would be required to produce about 30 feet of water level decline at the shoreline on the north side of the south lake. The water-level decline at various distances to the north one year after construction of the lakes can then be calculated using the aquifer discharge and the aquifer parameters transmissivity and storativity.

A value of 0.15 was selected for aquifer storativity, which is generally representative of unconfined sand and gravel aquifers. Since the calculations are made for a near steady-state condition after one year of discharge through the new lakes, the model calculations are not very sensitive to small variations in the value of storativity.

Brailey Hydrologic Consultants (2007) estimated transmissivity in the vicinity of the north lake and concluded that the value was in the range of 100,000 to 150,000 feet^2/day. A value of 100,000 feet^2/day was selected for the model calculations for this report. Under the conditions simulated, the calculated water-table position is also not very sensitive to the value of transmissivity selected, although the quantity of water discharged from the aquifer does vary with transmissivity.

The results of the model calculations were used to estimate the amount of water table decline as shown in the cross sections in Figures 7-9. Estimated lowering of the water-level in the aquifer at the location of Meirs Lake, for example, which is approximately 3000 feet from the south lake, is approximately six feet. Since Meirs Lake is likely in good hydraulic communication with the aquifer, the level of the lake is likely to drop by about that amount under the scenario evaluated.

Previous work suggested that the creation of the north lake, by itself, could result in a "slight (1-2 foot) depression of the water table around the north end of the lake" (Brailey Hydrologic Consultants, 2007). A review of this work suggested that the depression would be closer to four feet (J. A. Munter Consulting, Inc., 2009). The water-level declines caused by the south lake would likely be additive to this north lake depression as a result of the application of the principal of superposition. For example, the water surface of the north lake is expected to be lowered approximately six feet by the influence of the south lake, which would be added to the projected lowering caused by the north lake itself. If the previously estimated four feet of decline were to occur, that could result in up to 10 feet of decline in the aquifer around the north end of the north lake. This is illustrated in Figure 9.

The model calculations (assuming that both the north lake and south lake have been in existence for a year) suggest that water-table declines of several feet attributable to the gravel pits could extend 1.5 miles or more in a generally northward direction from the south lake.

Matanuska River braidplain boundary. The Matanuska River braidplain and Spring Creek lowland likely act as a constant-head boundary on the aquifer, and are expected to cause inaccuracy of the model calculations for areas near the braidplain and creek. At the braidplain or creek, water levels are expected to be relatively stable because of the influence of surface water flowing into the area from upstream and because of the large size of the braidplain aquifer. This effect will likely be present both northeastward and westward from the gravel pits. The effects of this boundary will gradually lessen in

an inland, or northward direction. In a direction nearly perpendicular to the edge of the braidplain, such as where sections A-A' and C-C' are drawn, the effects of the boundary are expected to be minimal. In other words, the model calculations will be most applicable in a direction straight away from the river. Cross section B-B' runs relatively close to the river braidplain (and Spring Creek) and the propagation of water level decline along that line of section is expected to be somewhat less as shown. Cross sections A-A' and C-C' do not run close to the river, and the model calculations are expected to be relatively unaffected by the river boundary in those areas.

Effects on wells. Development of specific and definitive conclusions about the future performance of any particular well or group of wells as a result of a lowered water table is not possible using the findings of this study. Such conclusions would require evaluation of site-specific conditions such as well depth, current water level, presence or absence of local confining units, well yield and efficiency, well location, projected water level decline, and other data that are specific to the well or wells being evaluated. This depth of inquiry is beyond the scope of this report.

The cross sections are useful, however, in providing a generalized assessment of the types and magnitudes of effects that may occur, and also illustrate some possible remedies. This assessment is potentially useful for planning and policy purposes.

The cross sections show that the lowered water table will likely result in some well failures. For example, three wells are shown on Figures 3 and 7 between the south lake and Meirs Lake that are projected have water levels near or below the bottom of the wells. Two of these wells appear to have been drilled in the 1980's for domestic purposes. It is not known if any of these wells are still in use.

Figure 7 also shows that other wells may experience enough of a lowering of the water table that their yield may be reduced, or they may experience sporadic outages. It is important to understand that the database of wells used for this work probably does not include all of the wells in the study area. Without further work estimating how many wells are missing from the WELTS database and obtaining additional well-specific information, it is difficult to estimate the total number or locations of wells that may be adversely affected.

These potential effects on wells are only partially or weakly linked to potential errors discussed earlier regarding the determination of well elevations. For a well drilled to a depth of 15 feet below the water table, for example, a 10- to 15-foot water-level decline at that location would likely be detrimental to the proper functioning of the well, no matter how accurate the determination of the land surface elevation.

Wells are also used for irrigating farms in the area, and the effects of irrigation pumping on water levels are not known.

Effects on lakes, streams, and wetlands. The surface water level of Meirs Lake is expected to be lowered approximately six feet under the potential gravel mining scenario evaluated. Most of the shoreline of the lake is privately owned, and such a decline would be noticeable beyond normal seasonal fluctuations, and may cause

difficulties for such structures as docks and boat launches. The lake is reported to be over 70 feet deep (Alaska Department of Fish and Game, 2010), however, so the changed amount of water in the lake is relatively small. It is not known whether this change would have a material effect on the current practice of withdrawing irrigation water from the lake during the summer.

Wells in the Bradley, Canoe, and Irene Lakes area are thought to be less affected by the lowering of the water table than Meirs Lake because of their closer proximity to the Spring Creek lowlands and Matanuska River braidplain as described above. However, they may exhibit observable water-level declines.

Other lakes, such as Baird and High Ridge Lakes may also experience observable water-level declines as a result of gravel mining.

A stream at the base of the Palmer Terrace would be mined through by excavation at the south lake. This may be an anadromous fish-bearing stream that is rearing habitat for Coho salmon and is regulated by the Alaska Department of Fish and Game (Alaska Department of Fish and Game, 2006). Since the south lake may have a surface water outlet, the lake may also become habitat for fish in the Matanuska River system.

It is not known if there are any wetlands within the vicinity of the gravel pits. If there are, however, and if they are of the type that are associated with the "permanent" water table (versus those based on a "perched" water table), these could also be affected by a lowered water table, potentially causing them to no longer meet criteria to be classified as wetlands.

Duration of effects. The hydrologic changes described in this report are expected to be relatively permanent. The new lakes, if developed as projected and then not changed, will create a new equilibrium condition in the area, although there will continue to be seasonal fluctuations in the water table. Should the lakes materially change or be filled in, the hydrologic system would be expected to change accordingly.

Mitigation Strategies

Most wells in the study area tap into the top of a relatively thick aquifer, making well deepening or redrilling to deeper portions of the aquifer an effective mitigation option for most wells. In some wells, a simple lowering of the pump might be sufficient. Monitoring of groundwater and lake levels would be useful for identifying the amount, location, and timing of any future water-table declines.

Modification of gravel mining plans to maintain separation from surface waters in the Matanuska River braidplain would also tend to reduce water-level declines in the area.

Construction of low-permeability water containment structures or systems around the perimeter of the south pond, either to limit discharge to the braidplain (and raise the lake water level) or to limit groundwater discharge into the lake (and raise groundwater levels in the aquifer surrounding the lake) would be difficult and expensive. Armoring any such structures in the braidplain to provide long-lasting protection from river erosion would

further increase the cost and difficulty. For these reasons, this is not currently suggested as a mitigation option. However, it may be worth considering further.

Summary and Conclusions

If gravel mining proceeds according to current plans, water-level declines are projected to occur in lakes and wells in the area. Some wells may fail as a result of the lowered water levels. Incomplete data about the number, location, and construction of all wells within the area precludes specific prediction of the number and geographic extent of problems related to well failures or reduced yields. Since most wells in the study area only tap into the uppermost portion of the aquifer, the prospects for successfully deepening or redrilling wells are excellent in most cases.

Additional wells may have capture zones that overlap areas subject to gravel mining and the water-supply aquifer may be subject to risks of water quality impairment, however the degree of risk associated with this is not determinable with existing information.

Limitations and Recommendations for Further Work

This work relies on plans and submittals by gravel mining companies to the Matanuska-Susitna Borough that may change in the future. The findings and conclusion of this work would change accordingly. The findings also rely on a widely accepted and commonly used mathematical model of the groundwater flow system. The assumptions made about the aquifer that are required by the model are only partially met. More complex models are available that would more realistically simulate the aquifer, particularly the river boundary, however they would require additional data and would be more complicated to run. The model chosen is considered to provide a realistic first approximation of the potential effects of planned future gravel mining in a generally northerly direction away from the river, where the model is considered to be most accurate.

Future evaluation would benefit from more accurate elevation data for wellheads, more recent and more frequent water-level measurements in wells and lakes, more wells in the database, and better data about changes in water levels caused by irrigation pumping in the area. These factors all potentially contribute to uncertainties in the current and projected future position of the water table depicted in the cross sections.

Site specific work is required to assess what the effects of any potential future lowering of the water table might be on any particular well. The water demand, pump setting and drawdown, well efficiency, seasonal fluctuations, and other factors would all contribute to such an evaluation.

purpose beyond those originally intended by the Borough. For information regarding the full disclaimer and policies related to acceptable uses of this map, please contact the Matanuska-Susitna Borough GIS Division at 1 (907) 745-4801.

Glossary

Aliquot part
The standard subdivisions of a section, such as a half section, quarter section, or quarter-quarter section.

Alluvium
A deposit of sediment left by a stream on the stream's channel or floodplain.

Aquifer
A permeable formation that stores and transmits groundwater in sufficient quantity to supply wells or springs.

Boundary conditions
Definition or statement of conditions or phenomena at the boundaries of a model; water levels, flows, and concentrations that are specified at the boundaries of the area being modeled.

Braided stream or river
A network of converging and diverging streams separated from each other by narrow strips of sand and gravel.

Braidplain
A surface exhibiting the converging and diverging stream channels of a braided stream or river, or the deposits contained therein.

Capture zone
The zone around a well contributing water to the well; the area on the ground surface from which a well captures water.

Cone of depression
A depression of the water table around a well during pumping; generally shaped like an inverted cone.

Confined aquifer
An aquifer that lies between two relatively impermeable rock or sedimentary units.

Confining bed or unit
a body of impermeable or distinctly less permeable material stratigraphically adjacent to one or more aquifers.

Crevasse
A deep fissure, as in a glacier; a chasm.

Esker
A glacial deposit in the form of a continuous, winding ridge, formed from the deposits of a stream flowing beneath the ice.

Fluvial
Of, relating to, or inhabiting a river or stream. Produced by the action of a river or stream.

Glacial drift
A load of rock and sedimentary material transported and deposited by a glacier or glacial meltwater. Glacial drift is usually deposited when the glacier begins to melt.

Glacial till or Till
Drift that is deposited directly from glacial ice and therefore not sorted.

Glaciofluvial
Pertaining to streams fed by melting glaciers, or to the deposits and landforms produced.

Groundwater
Water within the earth that supplies wells and springs; water in the zone of saturation where all openings in rocks and soil are filled, the upper surface of which forms the water table.

Homogeneity
A characteristic of a medium in which material properties are identical everywhere.

Hydraulic conductivity
The volume of water that will move through a medium in a unit of time under a unit hydraulic gradient through a unit area measured perpendicular to the direction of flow.

Isotropy
The condition in which the property or properties of interest are the same in all directions.

Kettle
A small hollow or depression formed in glacial deposits when outwash was deposited around a residual block of ice that later melted.

Lithification
The conversion of loose sediment into solid sedimentary rock.

Loess
An unstratified usually buff to yellowish brown loamy deposit found in North America, Europe, and Asia and believed to be chiefly deposited by the wind.

Outwash
A load of sediment, consisting predominantly of sand and gravel, that is deposited by meltwater in front of a glacier.

Perched water table
A saturated area that lies within a zone of aeration.

Permeability
The capability of a given substance to allow the passage of a fluid. Permeability depends on the size of and the degree of connection among a substance's pores.

Pitted Outwash
An outwash plain characterized by numerous depressions such as kettles, shallow pits, and potholes.

Sea level
The value zero (0) according to the North American Vertical Datum of 1929 (NGVD 29) used for this report.

Storativity (or storage coefficient)
The volume of water an aquifer releases from or takes into storage per unit surface area of the aquifer per unit change in head (virtually equal to the specific yield in an unconfined aquifer)

Superposition
The principle that states that drawdown from multiple pumping wells can be added together to determine total drawdown at any given location.

Terrace
A bench-like feature running along a valley side, roughly parallel with the valley walls. Most terraces form when a river's erosional capacity increases so that it cuts down through its floodplain.

Transmissivity
The rate at which water of the prevailing kinematic viscosity is transmitted through a unit width of the aquifer under a unit hydraulic gradient. It is equal to an integration of the hydraulic conductivities across the saturated part of the aquifer perpendicular to the flow paths.

Unconfined aquifer
An aquifer that has a water table.

Water table
The upper surface of the zone of saturation on which the water pressure in the porous medium equals atmospheric pressure.

Water-table gradient
The vertical drop in a water table's elevation over a given horizontal distance, typically expressed as a small decimal ratio of feet per foot.

Well drawdown
Drawdown is the change in water level observed at a well, typically due to pumping a well.

Well efficiency
The drawdown outside of a well divided by the drawdown inside of a well.

Zone of aeration
A region below the Earth's surface that is marked by the presence of both water and air in the pores of rocks and soil.

Zone of saturation
A region that lies below the zone of aeration and is marked by the presence of water and the absence of air in the pores of rocks and soil.

Groundwater Modeling Report, AS&G Palmer Pit

Anchorage Sand & Gravel, Inc.
Anchorage, Alaska

AUGUST 2010

EXECUTIVE SUMMARY

A groundwater modeling study was performed to assess the impact of dredging at Anchorage Sand and Gravel, Inc.'s (AS&G's) Palmer gravel pit. The proposed dredging operation would create a 130-acre lake approximately 100 feet deep. The purpose of the modeling effort was to provide an objective determination of the approximate lake elevation, and to assess potential impacts on nearby lakes and wells. For transparency to reviewers, the model is intended to be as simple as possible. This was accomplished by using the minimum number of layers needed to represent the groundwater flow system: one layer for aquifer materials that will be removed by dredging, one layer for aquifer materials that will remain after dredging, and one layer for bedrock. Around the perimeter of the model, a constant head boundary is used to mimic the regional water table slope. Local changes in water table slope are reproduced using the bedrock surface mapped using AS&G drill holes and a single zone of reduced hydraulic conductivity exposed as a silt lens on the adjacent property. The model uses a regional hydraulic conductivity value based on two high-capacity pumping tests that agree both internally and with nearby well yields. A reduced hydraulic conductivity for the silt lens is supported by adjacent pond elevations and by a domestic well test where the silt lens extends onto AS&G's property. Based on these data, the model reproduces the July 8, 2010 water table configuration with an average error within 0.5 feet, and within 0.2 feet through most of the model domain.

Although the model reproduces the July 8, 2010 water table configuration remarkably well, the model's parameter values and boundary conditions do not constitute a "unique" solution to the groundwater flow problem. That is, a slightly different set of parameter values and boundary conditions might produce an equally good fit. However, the selected parameter values and boundary conditions are "transparent", based on solely on pumping test data and measured groundwater elevations. If different water table conditions or hydraulic conductivity values are identified, these conditions can be evaluated either qualitatively or quantitatively by re-running the model.

The model calibration assumed that the July 8, 2010 water table configuration represents a steady-state condition, so that the rate of precipitation and groundwater inflow are exactly balanced by the rate of groundwater outflow. In reality, natural aquifers are always responding to seasonal changes in precipitation and recharge. As a result, the

1.0 INTRODUCTION

This document provides the results of groundwater modeling at Anchorage Sand & Gravel, Inc's. (AS&G's) Palmer Pit. The purpose of the modeling effort is to resolve questions regarding the effects of gravel dredging on the underlying aquifer. As shown on Figure 1-1, the dredging operation would create a 130-acre lake up approximately 100 feet deep. A previous assessment concluded that the lake would cause a slight (1 to 2-foot) depression in the water table around the north end of the lake, and a corresponding water table rise around the south end of the lake (Brailey 2007). However, questions remain concerning the resulting lake levels and effects on nearby wells (Munter 2009). Specifically, these questions include:

- What is the expected lake level, and what effect will this have on the surrounding aquifer?
- How much flow will pass through the lake as compared with the undisturbed aquifer?
- How will the lake affect the capture zones of the Crimson View and Pioneer Meadows public water systems?
- What options are available to minimize changes to the surrounding groundwater flow system?

Figure 1-1. Proposed Lake at AS&G's Palmer Pit

2.0 REGIONAL GEOLOGY AND HYDROLOGY

The Matanuska valley near Palmer is bounded by the Talkeetna Mountains on the north and the Chugach Mountains to the south and east (Figure 2-1). The Matanuska valley was formed by repeated glacial advances along a zone of faulting and deformation between metasedimentary and metaigneous rocks the Chugach Terrane on the south and granitic and sedimentary rocks the Peninsular Terrane on the north. Bedrock is exposed at the surface along the fronts of the Talkeetna and Chugach mountains, and is mantled by alluvium on the valley floor. The thickness of alluvium varies considerably, ranging up to over 200 feet near the center of the "Palmer terrace" (Pewe and Reger 1983; Figure 2-2). Local bedrock highs occur at Bodenburg Butte, a constriction of the Matanuska River near Palmer, and in the western part of the AS&G property (Figures 2-1 and 2-2).

Figure 2-1. Regional Geologic and Hydrologic Setting

separated the dredge pond from a topographically depressed area to the west. The silt lens was breached in July 2004, causing flooding of the depressed area and lowering of the dredge pond by as much as 7.6 feet (Figure 2-4).

Figure 2-4. Wilder Pond in 2003 vs. 2006

The "Palmer terrace" was deposited slightly after the crevasse-fill-ridge deposits, as the Naptowne ice front retreated to the north. These outwash deposits locally overlie the crevasse-fill-ridge sediments in the vicinity of the Palmer Pit (Pewe and Reger 1994).

Based on a regional water table map prepared by the U.S. Geological Survey (Moran and Solin 2006), groundwater flow is generally southward from the Talkeetna Mountain front (Figure 2-1). In the vicinity of the Palmer Pit, groundwater occurs in an unconfined aquifer tapped by numerous domestic and community water supply wells (Figure 2-5). The aquifer is relatively thick (locally over 200 feet) and commonly exhibits high well yields. Comparison of the water table elevation with adjacent floodplain elevations (Figure 2-2) suggests that the unconfined aquifer is recharged by both the Matanuska River and by groundwater inflow from the north. Oxygen isotope studies performed by the U.S. Geological Survey indicate that the water table aquifer

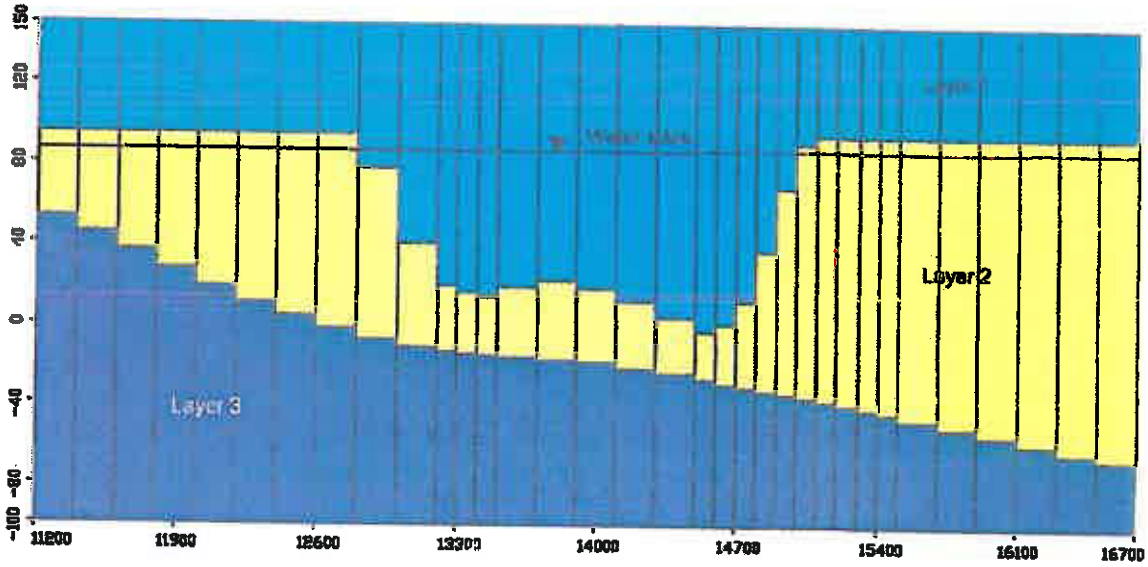
aerial photogrammetric measurements (AeroMetric 2008), the elevation difference between Baird and Irene Lakes is about 25 feet. Although the surface of Canoe and Irene Lakes is about 5 feet above the water table, the slope of the water table is consistent with the elevation difference between the lakes north and south of AS&G's property. The difference between the water table elevation and the surface of Canoe and Irene Lakes suggests that the lakes are perched by fine grained sediments lining the bottoms of the lakes. Perching of lakes and streams has long been recognized in the groundwater literature, and is commonly modeled using a reduced lake or streambed conductance relative to the underlying deposits (e.g. Merritt and Konikow 2000).

Although the unconfined aquifer generally flows southward toward discharge areas along the Matanuska River (Munter 2010), the lowest groundwater elevations occur in the southwest corner of AS&G's property (Figure 2-7). This suggests a zone of increased transmissivity south of Canoe Lake. By analogy with Echo and Kepler Lakes, Canoe and Irene Lakes were once occupied by stagnant ice masses separated by meltwater streams (Reger and Updike 1983). Flow constrictions between the stagnant ice masses could have resulted in high-permeability zones between the lakes. Fine-grained sediments and a former pond at the location of Wilder's central pond (Figure 2-2) suggest that an ice mass was present in this area. If so, meltwater flows could have been constricted between this area and the ice mass in Canoe Lake, resulting in a buried channel of high-permeability deposits.

The middle layer (Layer 2) represents aquifer materials that will not be disturbed by mining, and the top layer (Layer 1) represents materials that will be removed (Figure 3-2). The model was calibrated using the same hydraulic conductivity for Layers 1 and 2, representing hydrologic conditions before mining. The effect of gravel dredging was simulated by increasing the hydraulic conductivity of Layer 1 until all of the "lake" cells exhibited the same head. This provides an unbiased estimate of the lake elevation, dependent only calculated water flows into and out of the lake.

Figure 3-2. Model Cross Section: Row 13



The model's lateral boundary conditions are illustrated on Figure 2-1. Except where bedrock elevations are above the water table, the perimeter of the model is a constant head boundary with head values estimated from water table maps of the monitoring network.

Groundwater recharge from precipitation was included by specifying a recharge rate of four inches per year throughout the model domain. This represents about one-fourth of annual precipitation, and is consistent with recharge values estimated by Patrick and others (1989) for lower elevations in the Anchorage Bowl. Modeling results indicate that recharge from precipitation is a relatively small component of the overall water balance.

A final boundary condition was included to assess the impact of water supply wells on the local groundwater flow system. There are five domestic wells and two community water supply systems within the model domain. The Pioneer Meadows community

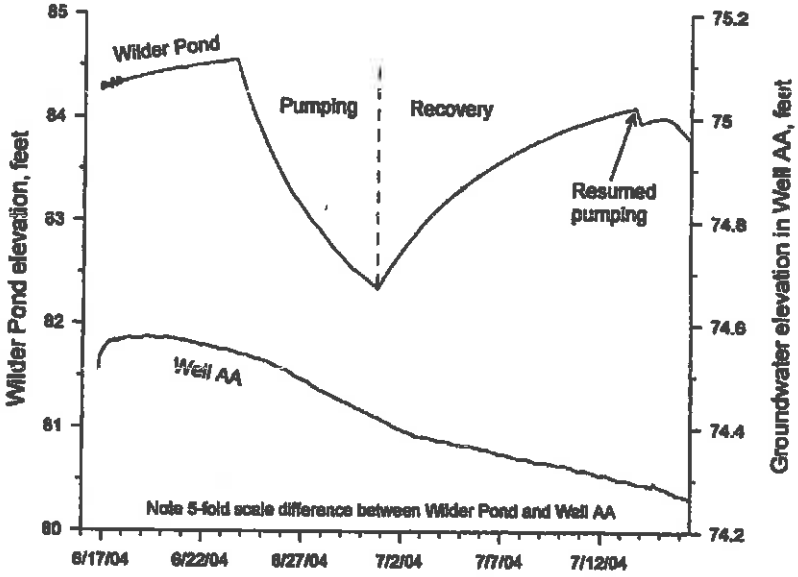
Figure A-2. Water Levels in Wilder Pond and Well AA



The pumping test data were analyzed using type curves for flow to a large diameter well developed by Mishra and Chachadi (1985). This approach requires the assumed geometry shown on Figure A-3, where the pond is considered to be cylindrical. The sloping sidewalls of the pond are simulated using the parameter α, defined as $\phi (r_w/r_c)^2$ where ϕ is porosity and r_w and r_c are the radial dimensions shown on Figure A-3. The

but it is 80 feet deep, with a static water level about 30 feet below ground surface. Local knowledge indicates that well has not been used since the mid-1980's, and that it may have been a high-yield well used for gravel washing operations.

The AS&G Well is 8 inches in diameter, but has no pump or power supply. It is not known if the well is screened, perforated, or open-ended. This information is important for analysis of measured drawdowns in the pumping well, which can be exaggerated if flow is restricted as it enters the well. For this reason, additional observation wells were considered for measurement of drawdown outside the pumping well. However, the small drawdowns reported for the adjacent Pioneer Meadows wells (AWPS 2010) raised concern that drawdown might not be measurable outside the pumping well. As a result, a single-well pumping test was planned prior to installation of any observation wells.

During single-well pump tests, drawdowns in the pumping well can be affected by friction losses and by pump turbulence. However, the rise in water level after the cessation of pumping (termed recovery) can also be used to determine hydraulic conductivity. Although early-time recovery data can be affected by friction losses, the pumped well rapidly equilibrates with water levels outside the well casing, so that intermediate- and late-time recovery data reflect water levels in the surrounding aquifer. The longer the well is pumped (and the higher the pumping rate), the larger the cone of depression becomes outside the pumping well. The use of intermediate- and late-time recovery data minimizes the effect of friction losses, and provides a measure of hydraulic conductivity at a larger radial distance from the well.

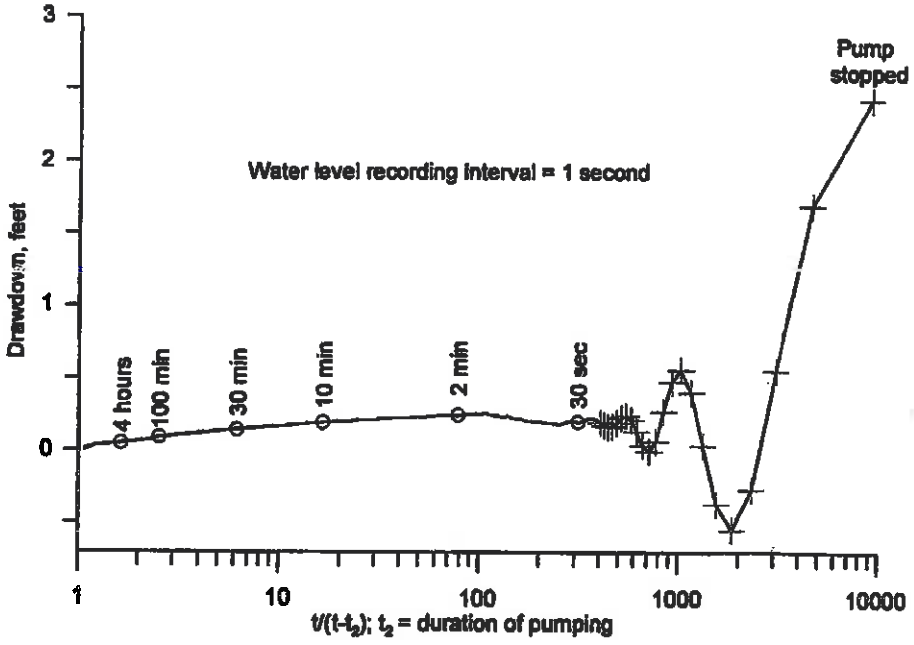
Based on high nearby well yields, Anchorage Well and Pump Service installed a 30-horsepower turbine pump on May 14, 2010. The pump was powered by a 160 kilowatt (kW) generator providing 3-phase, 460-volt power. The pump was connected with four inch-diameter pipe to a totalizing flowmeter and a hose discharging downslope from the pumped well. During the test, the discharge flowed over the ground surface to the pit floor approximately 400 feet northwest.

The water level in the pumped well was measured with a 5-psi pressure transducer suspended about 8 feet below the static water level. Figure A-8 shows a summary of water levels measured during pumping and the first 2 hours of recovery. The pump was first energized at 5:10 pm, but it produced only about one-tenth of its rated discharge (~300 gpm). The pump was turned off and on several times between 5:10 and 6:10 pm, during which it was determined that the pump impellers may have been plugged. Upon re-starting the pump at 6:18 pm, the pump produced a steady flow rate of 270 gpm, but the power was accidentally disconnected at 6:26 pm. The well was allowed to recover, and the pump was re-started for a final time at 6:51 pm.

showed decreasing drawdowns after the first 6 seconds of pumping. One explanation for this behavior is that the pump used during the test may be more powerful than previous pump(s) installed in this well. This would tend to remove fine sediment from the well screen and surrounding formation, thereby increasing the hydraulic conductivity in the vicinity of the well. Because of the decrease in drawdown over time, the drawdown data were not used for to determine hydraulic conductivity.

Water level data during the recovery period following the pump test are shown on Figure A-10. Recovery data are analyzed using a semilogarithmic plot of drawdown versus the quantity $t/(t-t_2)$, where t is the time since pumping started and t_2 is the duration of pumping. The recovery data show a series of oscillations after the pump was shut off, followed by a gradual water level recovery. Oscillating recoveries are commonly observed during slug tests in high-permeability aquifers (van der Kamp 1976), and are attributed to inertial forces within the well casing. In contrast, the aquifer response away from the well casing is best respresented by intermediate- and late-time recovery data, after the oscillations have ceased.

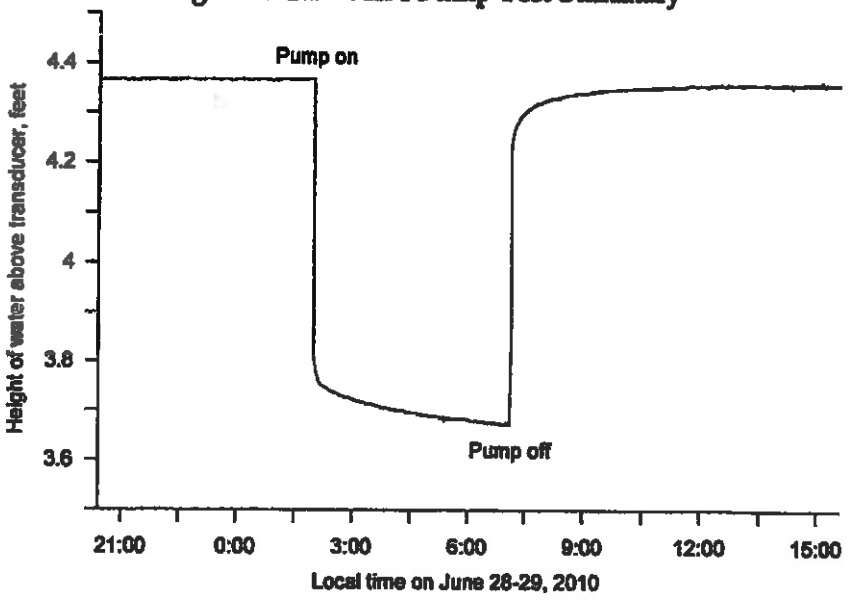
Figure A-10. Summary of AS&G Well Recovery Data



When plotted against $t/(t-t_2)$ on semilogarithmic axes, the recovery data should approximate a straight line at intermediate and late times. As shown on Figure A-11, the largest rate of recovery occurred between 30 and 100 minutes after pumping stopped, indicating an hydraulic conductivity of about 1,400 feet per day. The

To check for natural water level fluctuations, water levels in Well I were recorded for about 8 hours before the test. The well was pumped at 7.2 gpm for 5 hours, and the recovery of water levels was recorded for 9 hours after the test. Unlike the AS&G Well test, drawdown increased throughout the pumping period (Figure A-12), but the resulting hydraulic conductivity values were lower than those obtained during the recovery period. Because hydraulic conductivity values obtained during pumping can be biased by friction losses, the following analysis focuses on data obtained during the recovery period.

Figure A-12. Well I Pump Test Summary



Water level recovery data following the Well I pumping test are shown on Figure A-13. This plot has the same semilogarithmic axes as those discussed for Figure A-10. Due to the lower permeability at this location, initial recovery data does not exhibit the oscillations typical of high-permeability formations (van der Kamp 1976). Rather, the drawdown data shows a rapid decline after the pump was turned off, followed by a linear water level recovery. The slope of the recovery plot between 30 minutes and 8 hours after the cessation of pumping yields an hydraulic conductivity of 53 feet per day, which is significantly lower than the values measured at Wilder Pond and the AS&G Well. This is consistent with the low yield of Well I (7.2 gpm) as compared with the AS&G Well (270 gpm) and Wilder Pond (3,300 gpm).

Re: Hydrogeologic evaluation of a proposed monofill, Palmer, Alaska

Dear Ms. Lee:

This letter is to provide the findings of my recent review of data and reports related to a hydrologic evaluation of a proposed monofill consisting primarily of shredded construction and demolition (C & D) waste near Palmer, Alaska.

I have reviewed the on-line packets for the June 3 and June 17 meetings and relevant portions of the audio recording of the June 3 and June 17 public hearings.

You have requested that I provide:

- a summary of the concerns that the proposed monofill will raise regarding the water table;
- potential negative effects to the groundwater and down-gradient drinking water wells, and;
- characterization of the aquifer at risk – in layman's terms.

In addition, you would like me to review a June 14, 2013, letter from Central Monofill Services (CMS) and evaluate their section on "Protection of the Aquifer".

Summary of concerns that the proposed monofill will raise regarding the water table.

This section refers primarily to concerns and processes occurring within the site boundaries and at the water table beneath the waste. There are several features of the proposed monofill that merit examination, including:

- expected water flow through the waste;
- the concept of a natural soil liner at this site;
- the proposed 10-ft separation buffer to the water table;
- the expected time of travel of water or leachate through a 10-ft soil layer; and
- characteristics of waste to be disposed of and potential contaminants that may emerge.

Expected water flow through the waste. Review of the design documents, management plans, and public comments for this site shows that there appeared to be no significant effort to reduce or control infiltration of rainfall and snowmelt through the waste. Thus, expected rates of infiltration are expected to be similar to those that occur elsewhere in the surrounding landscape.

Infiltration, or groundwater recharge, is difficult to quantify with accuracy, however hydrologists commonly assume that approximately 20 to 30 percent of annual precipitation recharges groundwater in areas such as this. Such a percentage would mean that approximately 3 to 5 inches per year of precipitation would infiltrate and percolate downward through the waste. Using an eventual waste area of 30 acres, for example, this would equate to 300,000 to 500,000 gallons per year. Owing to the principal of conservation of mass, this amount of water or leachate would also need to flow out of the waste pile somewhere.

Low permeability liner. The public hearings contained considerable discussion of an "impermeable" clay/silt liner.

A review of the engineering drawings and specifications for the site show no provision for an engineered native-soil or other liner. This absence of engineering specification raises doubts about the effectiveness of such a liner. For example, there is no information in the record about the planned thickness, continuity, soil laboratory characteristics, tie-in with lateral boundaries, compaction, inspection, permeability, or numerous other aspects that are normally associated with engineered native-soil liners. There is no information in the record about the quantity of fine-grained material on site and whether there is enough to cover the site. Most of the soil borings on the site show that materials other than clay/silt are present at the land surface at the boring sites. The site has considerable topographic relief. In order for a liner to be effective, it must be continuous. There is no information about the applicant's intent to spread the fines over the higher areas as well as the lower areas.

This means that on-site personnel, whether they be equipment operators or supervisors, may be responsible for field decisions about the sources and spreading of low-permeability material. The apparent absence of any engineered, supervised, or inspected earth-moving process at this site along with the presence of abundant sands and gravels that are known to be present at the site substantially reduces the likelihood of successful construction of a low-permeability liner.

Mr. Young of Terrasat, at the June 3 hearing, commented that the clay/silt materials were "impermeable". A commonly-referenced textbook, Freeze and Cherry (1979), for example, notes that the permeability of clay and glacial till (including silt) can range from 10^{-6} to 10 gallons/day/sq. ft, however none of these materials are "impermeable" i.e. meaning completely impenetrable to water. Mr. Young's statement is misleading.

More importantly, however, the concept of placing an "impermeable" liner as described at the hearing at this site is severely flawed. With no impermeable cap, rainfall and snowmelt at this site will readily infiltrate and percolate vertically downward through the waste. Since there is no internal water collection system, this water would encounter the "impermeable" surface and pool up inside the waste. The fluid would then have no place to go except to fill pore spaces within the waste pile and create a perched water table that would rise up into the pile until it found an outlet somewhere around the perimeter. Leachate would then flow out and drain into the surrounding aquifer. The main effect of the impermeable liner would be to prolong the contact time of leachate water with waste material and increase the potential for dissolution of contaminants into the water. After the perched water table becomes established inside the pile,

the rate of outflow would be approximately equal to the rate of inflow from recharge and the net effect to the aquifer would be worse than if there was no liner at all.

As a result of the likely failure to construct an effective liner for the reasons described above and the adverse consequences if a liner were emplaced, this analysis will assume that there will be no effective liner for this site.

10-ft separation barrier and determination of the water-table position. The applicant proposes to keep a 10-ft separation between the bottom of wastes emplaced and the water table. The water table at this site is not well defined. The applicant has proposed to incorporate more recent water table measurements into facility design, however these measurements are currently unavailable for review, and in any event, do not consider several of the factors described below.

Following are problems with the current definition of the water table as provided on a map dated December 20, 2012 by Terrasat:

- Terrasat, in their August 2012 report, note that soil well logs were logged at different times, and locations may not be accurate or have accurate elevation control to establish the water table. It is not clear whether these problems were resolved for preparation of the December 20, 2012 map inasmuch as there is no report describing data and methods associated with that map. If these problems were not resolved, these would be non-standard and inaccurate methods for defining a water table.

- The measurements on which the existing water table map was produced on Dec. 20, 2012 have not been reported in the record so that it is difficult to verify the accuracy of the contouring.

- The contouring exhibits odd and inappropriate gradients of the water table across two of the ponds. Ponds at this site are considered to be an expression of the water table, and the water table should be flat (i.e. no gradient) at the ponds. The contouring is likely erroneous.

- Normal seasonal variations have not been measured and reported. Peak water-table elevations can occur in late September or early October in the Palmer area, so even springtime measurements would be inadequate to define the peak water table.

- Longer-term wet-year water-table fluctuations have not been analyzed or accounted for.

- The potential effects of changes in the water table caused by the reported recent construction of a weir in the dike separating nearby ponds or further breaches of the dike have not been evaluated (a breach apparently caused a 6-ft water-table rise a few years ago).

- Potential changes in the water table caused by future gravel mining in the area as described by Brailey (2007) and Munter (2010) have not been accounted for. Such gravel mining plans could increase water table elevations at this site by a few feet.

Combining all these factors, the water table map and any as-yet-reviewed updates are concluded to be an unreliable basis for designing a 10-foot water table separation at this facility.

Thus, the design of this facility appears to be insufficient to assure a 10-ft separation from the bottom of the waste to the water table.

Time of travel of water through 10 feet of soil. Mr. Young of Terrasat commented at the June 3 hearing that the 10-ft separation distance was not arbitrary – it was based on the length of time that it takes water to flow through it. Since ADEC does not specify that the soil used for the separation distance needs to be of low permeability, this statement has doubtful merit.

For example, using a textbook midrange value for the permeability of clean sand, water under saturated conditions can be expected to flow through a 10-ft layer in approximately 32 minutes. A similar calculation using a typical permeability for silty sand yields a time of travel of about 8 hours. Flow in each scenario would be slower under unsaturated conditions, however it can be readily seen that a 10-ft separation distance in coarse granular materials would yield very little delay-time protection from water migrating vertically downward from waste material into a water table.

An alternate explanation for the separation distance is that studies have shown that landfills that are partially submerged below the water table are generally more prone to leaching and contaminating groundwater as a result of the longer contact times of the waste in contact with water. A 10-ft separation would at least provide some assurance that the wastes will not reside in saturated conditions at most sites. Notably, ADEC allows monofills to be constructed on high-permeability sands and gravels as long as the separation distance is met. Thus, it appears that time of travel is not a significant factor in their evaluation.

C & D Landfill Leachate. C & D landfills are very common in the United States because this type of waste is abundant, is perceived as relatively inert, and because these types of facilities are usually subjected to less stringent environmental protections that normal landfills and thus costs of disposal tend to be lower.

The evaluation of leachate contamination to groundwater from C & D landfills appears to be an evolving science. These facilities have commonly been regarded as minimal threats to groundwater because they have been considered to contain relatively "inert" materials. Far from being chemically inert, however, many materials in C & D landfills, including wood and drywall will rot, decay, and leach constituents into groundwater. At least 27 states now require groundwater monitoring from such landfills, in increasing recognition of their potential to contaminate groundwater.

Studies have shown increased concentration of some contaminants from these types of facilities. A study conducted for the U.S. EPA from 1995, for example, (ICF Incorporated, 1995) found groundwater contaminants that exceeded primary or secondary Maximum Contaminant Levels (MCLs) for drinking water at 11 C & D landfills. Potential contaminants from the proposed

facility include sulfate, iron, manganese, total dissolved solids, arsenic and other metals, and organic compounds.

Many of the wastes proposed for the monofill, including wood, drywall, carpet, and probably even tire bales are not geologically stable in the Palmer area. Waste breakdown will inevitably result in dissolution and entrainment of waste constituents in leachate.

While the proposed monofill proposes to exclude "Hazardous Waste", it is not clear what this means, and in particular, that all waste that may be hazardous to water supplies will be excluded. For example, it appears that treated lumber containing compounds or elements known to be hazardous to human health appear to be allowable in the waste stream.

The term "Hazardous Waste" has numerous technical definitions that stem from the numerous laws and regulations that govern them. In this case, there will be a reliance on pre-demolition "Hazardous Building Material Surveys" and the proper exclusion of items described therein. The existence, thoroughness, and accuracy of these surveys is therefore important to the process, however it is difficult for the Borough to know or be assured that all materials that are potentially hazardous are appropriately excluded.

An important aspect of water contamination is that only a small amount of some compounds or elements are needed to contaminate a large volume of water. Arsenic, for example, has a drinking water primary MCL of 10 micrograms/liter, or approximately 1 part in 100 million. The waste will be shredded, thus making for a relatively large surface area of waste in contact with percolating waters. It is not unreasonable to expect that even small percentages of leachable wastes in the 2 million cubic yards of waste will result in measurable quantities of contamination.

This is a large facility. Considering that the proposed facility has a planned capacity of 2 million cubic yards of material and will have a service life of over 25 years, it would be reasonable to assume that there will be a sufficient amount of waste accumulated to generate leachate that will exceed one or more drinking water Maximum Contaminant Levels.

There are no significant barriers to the migration of this leachate into groundwater and it is highly likely to result in measurable increases in contaminants beneath the facility and for some distance down gradient.

Potential negative effects to the groundwater and down-gradient drinking water wells.

It is prudent to assume that the proposed monofill will be in place for perpetuity. Nearby residential areas are also assumed to be used in perpetuity, and also that they will be served by on-site wells for water supply. Thus, long-term (i.e. hundreds of years) considerations of the effects of the proposed monofill are important.

Some common contaminants are known to migrate thousands of feet downgradient from source areas. In this area, the sand and gravel aquifer has a generally low potential to attenuate contaminants. Without more detailed studies, detailed predictions of the maximum potential

distance that contaminants could flow are difficult to make. Considering all of the uncertainties, however, it would not be unreasonable to consider that all of the wells within a one-mile radius in a down-gradient direction are potentially at risk.

Groundwater is believed to flow towards the southwest and there are numerous wells in that general direction. An important aspect of the proposed monofill is its large size. At approximately 1000 feet wide in a direction perpendicular to the direction of groundwater flow, and considering the normal widening of plumes from their source, it should be expected that if any significant amount of contamination should emanate from this site, it will encompass numerous (i.e probably more than 20) wells within a one-mile radius in a down-gradient direction. Some of these wells are shown on Inset 2, Detail of Figure 2, of Munter (2010). The existing public databases on which these well data are based are generally known to be incomplete and there are likely some wells for which there are no known well records in public databases, and thus there are likely more wells present than are mapped.

As described in more detail below, most of the known wells tap the same aquifer as the aquifer that underlies the proposed monofill site. Thus, there is the potential to contaminate water wells from this facility.

An EPA study documented increases in several constituents downgradient of C & D landfills. Regulatory significance of these increases is based largely on whether specific water quality standards are exceeded, and whether the MCLs are primary or secondary standards. Secondary standards exist primarily for aesthetic, not health-based reasons. Even exceedence of aesthetic standards, however, is expected to adversely affect well owners who may object to any change in their water quality. Such changes can prompt the need for water treatment, additional testing for other health-based contaminants, and create uncertainty over the quality and health-security of their water and potential impacts on themselves, other household residents, and guests who may consume the water.

For some trace contaminants, even the MCL is the subject of evaluation and change, as exemplified by the reduction of the MCL for arsenic in drinking water from 50 micrograms/liter to 10 micrograms/liter since 2001. Thus, when considering long-term water quality concerns, even reliance on current water quality standards as determiners of safety is not necessarily protective.

Characterize the aquifer at risk – in layman's terms.

The aquifer at risk is comprised predominantly of sand and gravel with some silt. Tha aquifer extends from hilly regions northwest of Palmer to the Palmer Hay Flats to the south and practically all of the private and public wells in the vicinity use it for water supply. The sand and gravel generally extends from the land surface to bedrock, which occurs at varying depths up to approximately 200 ft in the area. The water table, which is essentially the top of the zone of saturation, occurs at a varying depth from essentially 0 ft at the edges of ponds and lakes up to approximately 100 ft, depending on the topography. This aquifer is also known as an unconfined aquifer. The direction of groundwater flow in the aquifer is generally towards the south and southwest.

All of the water wells, monitoring wells and surface water bodies in the close vicinity of the proposed monofill tap the same aquifer. The silt deposits above and within the aquifer are small and generally are not laterally continuous or thick enough to constitute significant protective layers on the scale of the analysis of the effects of the proposed monofill.

Review of a June 14, 2013 letter from Central Monofill Services and evaluation of section on "Protection of the Aquifer".

A key point made in the letter from CMS on aquifer protection is their assertion that there are two aquifers. This assertion appears to stem from non-public analysis and public testimony from Mr. Young of Terrasat on June 3. While the analysis is stated to follow many years of study of the area, the testimony is peculiar because Terrasat's own groundwater study report of August 2012, signed by Mr. Young, makes no mention of this condition.

Terrasat constructed a three dimensional groundwater flow model of the area of the proposed monofill. Terrasat describes the sediment to "consist mostly of sand and gravel with varying amounts of silt and silt lenses". There is no mention of any significant confining layer separating two aquifers.

Terrasat states that "Three hydrologic layers were used to represent the unconfined aquifer in the modeling area". There is no mention of a layered aquifer system with two aquifers separated by a confining layer. The use of three layers to model a single aquifer is a common modeling technique for modeling irregular aquifer boundaries in a single aquifer.

Terrasat also presented a detailed bedrock topographic map that was used to define the base of the single unconfined aquifer.

The model results presented by Terrasat demonstrate that the unconfined aquifer responds as a single hydrogeologic unit that responds to hydraulic stresses imposed upon it, such as the breach of the dike between two of the ponds and a six-ft rise in the water table. This aquifer extends at least from Canoe Lake to the ponds northeast of the monofill site and southward to the Glenn Highway and beyond and includes the proposed monofill site.

Interestingly, the on-site boring logs and all of the recent reports on the site by Terrasat, Brailey, and Munter as contained in the on-line packets are consistent in describing the presence of a single unconfined aquifer above bedrock with a thickness up to approximately 200 ft. The analysis upon which Mr. Young based his testimony is absent from the public record and unavailable for examination. Mr. Young's conclusions, therefore, about the presence of two aquifers are unsubstantiated and should not be relied upon.

While silty zones are present within the aquifer, nowhere have they been demonstrated to be of sufficient thickness or lateral continuity to constitute a confining layer that separates two aquifers. For the purposes of contaminant transport on the scale of the proposed facility and its surroundings, the aquifer should be considered as a single unit that will allow contaminants to migrate horizontally and vertically in response to normal groundwater flow system processes.

While increasing distance from a source provides some protection, wells in the area should not be considered "protected" on the basis of tapping into a different aquifer.

Regarding the assertion that CMS's hydrologist has determined that there are two aquifers at the site and testified accordingly, I found no credible evidence in the written record or in my own analysis of the hydrogeology of the area that this is a reasonable conclusion for the aquifer in the area.

The letter also refers to "our clay/silt liner" as a protective element of the project. This topic is covered in detail above, concluding that no effective liner should be assumed for this proposed development.

In summary, the letter's principal hydrogeologic conclusion that contamination of water in water wells will "never happen" should not be relied upon.

The letter also states that they have the ability to "discover and remediate any contamination" of the aquifer, should it occur. This will be difficult or practically impossible to accomplish. Remediating groundwater contamination is, in general, very difficult and expensive, and in many instances, simply impractical. For example, "pump and treat" systems have been found to be generally not cost-effective. Subsurface reaction barriers are very expensive and difficult to design, construct, and operate and work for only some contaminants. Monitored Natural Attenuation, in which contaminants are allowed to naturally disperse and degrade while being monitored works only if there are no nearby receptors such as wells, streams, or lakes. This may not be appropriate for this site.

Because remediation of groundwater is so difficult, the practical solution that public managers develop at many sites is the provision of public water from a safe source and the abandonment of private wells. This does not solve the problem of seepage of contaminated water to lakes and streams, however, or solve other long-term problems related to ownership and management of contaminated sites.

Remediation efforts commonly start with isolating or removing contamination sources. Removing all of the accumulated waste in the monofill might be impractical. However, constructing a permanent impermeable cap might help isolate the source from percolating water. This would effectively stop all operations at the facility.

Without further clarification from the applicant on how they would remediate the aquifer, and more importantly, how it would get paid for, groundwater remediation should not be regarded as a viable management strategy at this site.

The letter also states that a groundwater monitoring program will protect water wells. This conflicts with the applicant's submittal to ADEC that states "N/A" with regard to the presence of a groundwater monitoring program. In the absence of further information about the program, it is impossible to confirm that it is at all protective of the aquifer or nearby water wells.

In summary, the section of the report about "protection of the aquifer" does not appear to provide any substantive assurance that the aquifer is protected or that groundwater contamination can be detected or remediated should it occur.

Should you have any questions about this report, please call me at 345-0165 or 727-6310.

Sincerely,
J. A. Munter Consulting, Inc.

Re: Review of an application for a Conditional Use Permit for a proposed monofill near Palmer, Alaska

Dear Ms. Lee:

This letter is to provide the findings of my recent review of the application by Central Recycling Services and supporting documents related to a proposed monofill consisting primarily of shredded construction and demolition (C & D) waste near Palmer, Alaska.

A key part of the application packet is a report by Maddox and Associates, Inc (M & A) entitled Evaluation of proposed Palmer monofill with respect to potential impact on groundwater" dated December 13, 2013.

Since the application relies heavily on the findings of this report, it is reviewed first, followed by comments on the main application.

I. Review of: Evaluation of Proposed Palmer Monofill with Respect to Potential Effect on Groundwater by Maddox and Associates, Inc., Murrieta CA, December 13, 2013.

Page 1-3 Executive Summary

The executive summary contains information that repeats information found elsewhere in the report, and is not separately reviewed here.

Page 3 Introduction
While Maddox and Associates, Inc. (M &A) reports "working in all regions of the United States and in Canada", there is no specific mention of having worked in Alaska. Subsequent portions of the report seem to indicate a lack of familiarity with Alaska conditions (see p. 6 of this review). The summary of work performed does not contain any mention of a site visit.

Section 2.2 Site Conceptual Model
The site conceptual model in this report does not comply with Alaska guidance and normal use in Alaska of site conceptual models (see, for example, http://dec.alaska.gov/spar/csp/guidance/FINAL%20CSM%20Guidance%20MASTER%20Nov%202010.pdf). In particular, site conceptual models should not be used to quantify or assess health or environmental risk, only to identify pathways and potential receptors and exposures.

Page 4. Last paragraph
This paragraph provides a reasonable definition of inert waste as it seems to be commonly used in the solid waste disposal industry. The term, "inert", as used in this context, however should not be confused with the more common usage of the term as meaning "not chemically reactive" or, perhaps more importantly, soluble in water. For example, drywall is comprised mainly of the mineral gypsum, which is essentially calcium sulfate. When exposed to water, gypsum dissolves into the ions calcium and sulfate. This is the most likely source of elevated sulfate levels found in monofill leachate. The leachability tests conducted on waste for this project, for example, found sulfate levels of 520 to 673 mg/L, compared to the secondary drinking water standard of 250 mg/L.

Other materials disposed of at "inert" monofills will also eventually rot, decay, and leach constituents into groundwater. At least 27 states now require groundwater monitoring from such landfills, in increasing recognition of their potential to contaminate groundwater.

Studies have shown increased concentrations of some contaminants from C & D landfills. A study conducted for the U.S. EPA in 1995, for example, (ICF Incorporated, 1995) found groundwater contaminants that exceeded primary or secondary Maximum Contaminant Levels (MCLs) for drinking water at 11 C & D landfills. Potential contaminants from the proposed facility include sulfate, iron, manganese, total dissolved solids, arsenic and other metals, and organic compounds.

A more thorough and recent study of leachate from 30 Construction and Demolition Debris (C & DD) landfills in Ohio (Ohio, 2009) found the following conclusions:

> Ohio C&DD leachate contains a wide variety of inorganic parameters including heavy metals, light metals, trace elements, and other ions. It also contains a wide variety of organic parameters including pesticides, chlorinated solvents, non-chlorinated solvents, gasoline, substituted benzenes, phenolics, chlorofluorocarbons, polycyclic aromatic hydrocarbons (PAHs), phthalates, substituted alkanes, and alcohol.
>
> The leachate from all 30 C&DD landfills had from 3 to 29 parameters with concentrations that exceeded health based standards, surface water quality standards, or both. The median was 12.5 parameters exceeding the standards. The leachate from 29 of the 30 C&DD landfills had eight or more parameters that exceeded the standards.
>
> The wide variety of parameters detected in C&DD leachate, the wide variation in the number of parameters that exceeded health based standards and surface water quality standards in C&DD leachate and the magnitude of the exceedances are evidence that C&DD is not harmless or inert.

Many of the wastes proposed for the monofill, including wood, drywall, carpet, and probably even tire bales are not geologically stable in the Palmer area. Waste breakdown will inevitably result in dissolution and entrainment of waste constituents in leachate if water flows through the waste.

While the proposed monofill proposes to exclude "Hazardous Waste", it is not clear what this means, and in particular, that all waste that may be hazardous to water supplies will be excluded. For example, it appears that treated lumber containing compounds or elements known to be hazardous to human health appear to be allowable in the waste stream. The application does not address whether materials from buildings demolished as a result of building fires will be disposed at the facilities. Building fires are known to create compounds adverse to public health.

The term "Hazardous Waste" has numerous technical definitions that stem from the numerous laws and regulations that govern them. In this case, there will be a reliance on pre-demolition "Hazardous Building Material Surveys" and the proper exclusion of items described therein. The existence, thoroughness, and accuracy of these surveys is therefore important to the process, however it is difficult for the Borough to know or be assured that all materials that are potentially hazardous are appropriately excluded.

An important aspect of water contamination is that only a small amount of some compounds or elements are needed to contaminate a large volume of water. Arsenic, for example, has a drinking water primary MCL of 10 µg/L, or approximately 1 part in 100 million. The waste will be shredded, thus making for a relatively large surface area of waste in contact with percolating waters. It is not unreasonable to expect that even small percentages of leachable wastes in the 2 million cubic yards of waste will result in measurable quantities of contamination.

Considering that the proposed facility has a planned capacity of 2 million cubic yards of material and will have a service life of over 25 years, it would be reasonable to assume that there will be a sufficient amount of waste accumulated to generate leachate that will exceed one or more drinking water Maximum Contaminant Levels.

There are no significant barriers to the migration of this leachate into groundwater and it is highly likely to result in measurable increases in contaminants beneath the facility and for some distance downgradient.

Page 5 Paragraph 2

The seasonal high groundwater level has not been determined at this site. Review of the groundwater data and design drawings do not establish where the base of the waste will be in absolute elevation terms. The report fails to show that the bottom of the waste will stay dry during high water events.

Page 5 Paragraph 3

The description of secondary MCLs is somewhat simplified and misleading, at least with regard to sulfate. Sulfate was detected in three leachate samples from CRS at levels ranging from 520 to 673 mg/L. The secondary MCL for sulfate is 250 mg/L, based largely on the fact that elevated sulfate levels have a laxative effect. At levels up to about 600 mg/L, humans generally can adjust to this effect (Rowden, 2008). At levels above 600 mg/L, because of the laxative effect and effects on taste, it is an over-simplification and misleading to characterize such effects as "cosmetic" or "aesthetic". Background levels of sulfate in groundwater in the Palmer area are generally less than 50 mg/L, so local residents would not be expected to be adapted to high sulfate levels. So, if local wells were contaminated at levels between 250 and 600 mg/L,

homeowners could be in the awkward position of advising guests to not drink the water in order to avoid laxative effects, even if the residents themselves had adjusted to the effect. Home treatment systems to reduce sulfate levels would probably require a membrane filter technology such as reverse osmosis, which can be expensive to install, maintain and operate.

Page 5 Paragraph 5
The opinion that "it is not likely that a significant volume of liquids will pass through the monofill bottom into the water table" is not considered reliable as discussed subsequently in this review.

Page 5 Paragraph 6
Modeling analysis and results are reviewed in a subsequent section of this review. There is no evidence that the modeling results have been or will be used to "determine the proper location of guard wells". The monitoring plan included in the packet was written in the spring of 2013, well before the modeling studies were performed. Also, the well locations shown in the plan would not intersect the leachate plumes modeled. See further comments later in this review about monitoring.

Page 6 Paragraph 1
The following paragraph is not adequately supported by the analysis presented:

> The SCM indicates that the construction and operation of the proposed monofill is not likely to have a detrimental impact on the groundwater beneath or down-gradient of the site.

Furthermore, the normal Site Conceptual Model purpose of identifying potential pathways and receptors appears to have been subverted by premature dismissal of a likely pathway – that of contaminant migration to groundwater. The CSM also does not address potential impacts to surface water downgradient of the proposed monofill.

Page 7 Paragraph 2
The ADEC permit is not attached. The ADEC information attached identifies substances that may be prohibited from being disposed in the monofill, but there does not appear to be a list of materials that are allowed.

Page 7 Paragraph 4
This paragraph states that water levels have been measured over four seasons and that the seasonal high groundwater table has been determined. If this information has been collected, it has not been provided. The water-table map was constructed based on water levels measured on July 1, 2013, which is known to not be when peak water levels generally occur in this part of Alaska. Peak water levels typically occur during spring, after snowmelt, or in late fall.

Page 7 Paragraph 9
The following statement is, at a minimum, unclear and is also misleading.

> Where present, such grades will greatly facilitate the flow of precipitation from the monofill surface, thus significantly reducing the amount of infiltration into the refuse.

The grades referred to, of 50% and 33%, are clearly designed only for the sideslopes of the final fill structure which are only approximately one quarter or so of the surface area of fill. Approximately three quarters of the fill area is designed with a relatively flat final cap (with a finished grade of 2% to 3%), which will be very conducive to groundwater recharge and downward percolation through the waste. The nearly flat top surface of the monofill is illustrated graphically in figure 3-2 of the M &A report. It is misleading to suggest that the small area of steep slopes around the perimeter will "greatly facilitate" runoff from the "monofill surface", without noting the larger area of almost flat surface.

Page 10 Paragraph 1
This section does not address changes in water levels caused by gravel mining. Historical information and analyses (Munter (2010) and the water table map all illustrate that the creation of dredge ponds or dewatering activities can have a significant influence on water levels in the unconfined aquifer. In addition to natural seasonal fluctuations, the possibility of water level changes caused by future gravel mining or dewatering should be addressed.

Page 13 Paragraph 5
The direct comparison of pond water to City of Palmer drinking water is not appropriate because public water systems such as at Palmer are required to complete a broader panel of water quality tests prior to use of the system. There are no data to show that the pond water would meet those additional tests. The comparison to Alaska Drinking Water Standards is appropriate only for the parameters tested, not a blanket statement that the pond water "does not exceed Alaska Drinking Water Standards."

Page 14 Paragraph 2
It is not likely that the three samples of shredded material are representative of the entire volume of fill to eventually fill the 35.5 acre site. There is no information on the sampling technique (random, composite, etc.) or the sample size, compared to the individual particle size of the waste. Considering the diversity of materials allowed in the fill that are not reported to be part of the samples (carpet, treated lumber, semi-burned materials, etc.) or that may escape detection and end up in the fill, it is unlikely that the three samples accurately reflect the average composition of the fill. This limits the interpretive value of the data.

Page 14 Paragraph 3
The analytes do not encompass all of the water quality parameters that have been known to exceed water quality standards. Total Dissolved Solids is one example of a missing analyte.

The usefulness of the SPLP leaching test results is limited by the unusually high Limits of Quantitation (LOQs) reported by the lab (see appendix of report). Iron, for example, has a reported LOQ of 50 mg/L, compared to the water quality criteria of 0.3 mg/L. This means that if

iron levels were less than 50 mg/L, they were reported as not detected. So, while the sample results technically did not exceed the LOQs, the results cannot be interpreted as confirming that the samples did not exceed water qualitystandards other than those provided in Table 7.1. A similar situation exists for arsenic, which has an LOQ of 0.250 mg/L, compared to a drinking water standard of 0.010 mg/L. The cause for the high LOQs appears to be unusually high dilution factors used in the laboratory analyses. In summary, the SPLP tests did not produce results that demonstrate that the leachate generally meets primary water quality standards.

Page 15 Paragraph 1
Manganese and sulfate are noted to exceed secondary Drinking Water Standards in the leachate tests, which are described as non-enforceable guidelines, only affecting cosmetic or aesthetic characteristics of water. As previously described, the effects of sulfate may go well beyond cosmetic or aesthetic effects, and the history and reasons of why it is not regulated differently go beyond the scope of this review.

Sulfate is described as being not a "problematic constituent" by USEPA. This may be irrelevant to the Matanuska Susitna Borough because the drinking water standards used by EPA are applicable to public drinking water supplies. Private domestic wells in Alaska are left to local governments to regulate or not. In Anchorage, for example, while all public water supplies are required to meet a standard for nitrates of 10 mg/L, the Municipality of Anchorage will issue a Certificate of On-Site Adequacy (i.e. the well is "approved") for wells with water containing concentrations of nitrates over the 10 mg/L limit applicable to public water systems.

In this situation, if the MSB decides, after an appropriate decision-making process, that sulfate levels are important to local well owners, then it would not seem to make any difference what the USEPA thinks is suitable for public water systems.

Section 7.1.1, Pages 15-17
The ICF Incorporated study reportedly identifies 24 parameters from C & D leachate samples from numerous facilities that exceeded water quality parameters at least one time. The Ohio study notes that C & D leachate is not expected to meet water quality standards for discharge to groundwater. The Wyoming memorandum mainly seems to be saying that C & D leachate is not as bad as that from regular landfills. Take-away messages from these three studies seem to be that C & D leachate should be considered a pollutant, this pollutant should be expected from C & D landfills that generate leachate, and that good management practices can be helpful in reducing the impact of the leachate.

It seems that there could be some parallels between the regulation of C & D landfills and septic systems. Even properly designed and operating septic systems, for example, are known to release effluent that exceeds drinking water standards for one or more constituents. One of the principal successful tools for managing septic systems is through mandatory separation distances to drinking water wells. Septic systems continue to be popular because: 1) they are inexpensive compared to other options; 2) they are effective in treating household waste for long periods of time: and 3) they have been shown generally not to result in groundwater contamination most of the time.

The M & A report essentially makes the case that the leachate from the proposed monofill, while modestly exceeding water quality standards, would be sufficiently diluted prior to reaching offsite water wells or surface water receptors such that it would not be a problem. This brings up the concept of a separation distance to surrounding wells or receptors. The current ADEC permit for Alaska Demolitions C & D landfill, for example requires a 500-foot separation distance to surrounding wells. (ADEC Solid Waste Disposal Permit SWZA004-14).

Section 7.2, Pages 17-20
This section contains numerous deficiencies, as detailed below.

Page 17 Paragraph 6
This paragraph erroneously states that the 15.49 inches of annual precipitation at Palmer occurs as rain. There seems to be an unawareness of local climate conditions. Nowhere in the report have I found the words "snow", "snowpack", or "snowmelt". Furthermore, there is no evidence to support the supposition that there is more surface runoff than infiltration. In contrast, Kikuchi (2013, Appendix C) used a deep percolation model to estimate that recharge is approximately three times the amount of surface runoff in this area.

M & A references a course from the Lund Institute of Technology in Sweden to conclude that "a fully-saturated soil becomes almost an impermeable layer". This may be true in the context of a high-intensity rainfall on a low-permeability soil, however it has practically no relevance to the proposed monofill. The final cap materials for this monofill will be local materials, primarily sand and gravel, overlain by a porous organic soil that will support a vegetative cover. Such well-drained soils should not be characterized as "almost impermeable", even if saturated. Also, most precipitation and snowmelt in the Palmer area does not occur as high intensity rainfall. It is more common to have long-duration, low-intensity rain that contribute significant amounts of water to groundwater recharge. Kikuchi (2013) reports that the "core area" of the Matanuska-Susitna Borough receives approximately 5 inches of annual groundwater recharge, demonstrating the prevalence and importance of groundwater recharge processes in the local area.

M &A suggests that compacting the fill will greatly reduce its capacity for infiltration. Consider the situation when the monofill is completely filled and closed. With a 2 percent slope on the top surface, water will infiltrate into the cover. The issue here is whether the compacted fill materials are permeable enough to transmit water vertically downward through the filled cells. There are no data provided on the permeability of the fill. Suppose 5 inches of rain infiltrates the surface and percolates down to the top layer of fill. Darcy's Law shows that the hydraulic conductivity for the fill needed to transmit 5 inches/yr of water downward at a uniform rate is only 0.001 ft/day. This value is typical of silt (Freeze and Cherry, 1979). Reviewing the results of geotechnical testing performed on the compacted fill (Attachment H of the Application packet), it is highly unlikely that the compacted fill would exhibit a hydraulic conductivity as low as 0.001 ft/day. Thus, it would be prudent to assume that the compacted fill has a sufficiently high hydraulic conductivity to pass all the water that infiltrates into the landfill cover and to allow it to percolate downward through the waste at the site.

M & A also suggests that the steep slopes at the site will promote runoff rather than infiltration. M & A fails to note however, that the vast majority of the completed fill structure will have an almost flat (2-3%) slope, which will be very conducive to promoting groundwater recharge. To illustrate this, for example, the application packet suggests that the completed structure may be suitable for agriculture, park lands, or sports fields.

M & A compares the climate of Palmer to that of Los Angeles, California, and describes both as semiarid and "without significant annual precipitation". This assessment is incorrect. Climate classification schemes also use potential evapotranspiration and temperature regimes to classify climates. Palmer has much lower average annual temperatures and much lower potential evapotranspiration rate than Los Angeles. Kikuchi (2013) classifies the climate at Palmer as transitional between maritime and continental. There is significant annual precipitation in the Palmer area. It is sufficient to support mature deciduous and coniferous forest, hundreds if not thousands of household water-supply wells, numerous municipal and irrigation wells, non-irrigated agriculture, perennial flows in numerous streams and rivers, and many stable lakes. All these water uses are supported by annual precipitation without causing any significant net long-term change in groundwater storage (as noted by M & A).

M &A describes a cyclic infiltration process characterized by short periods of intense rain followed by evapotranspiration and drying out of surficial materials. This model may apply some places, but is not suitable for the proposed monofill.

According to a weather summary for Palmer, rain is usually not intense (http://weatherspark.com/averages/32899/Palmer-Alaska-United-States):

> "Over the entire year, the most common forms of precipitation are light rain and light snow.
>
> *Light rain* is the most severe precipitation observed during 46% of those days with precipitation. It is most likely around August 9, when it is observed during 37% of all days."

Furthermore, recharge processes in the spring and fall occur at times when evapotranspiration is low to very low and the soils and fill at the site are expected to be sufficiently well-drained that they can readily absorb relatively large quantities snowmelt and precipitation. There is no presentation of data to support M & A's infiltration scenario and it should not be relied upon.

M & A summarizes this section with the following major conclusion:

> "…it is likely that none of the precipitation will make its way through the considerable thickness of the proposed monofill. It follows, then, that it is unlikely that any of the monofill constituents will leach into the water table."

This conclusion is not supported by data or sound analysis and I do not concur for the reasons cited above. The thickness of the monofill is largely irrelevant. If water enters the top of the structure, it will percolate down and eventually exit. Water that goes in must come out.

Kikuchi (2013, Appendix C) tabulates modeled values of groundwater recharge in the vicinity of the proposed monofill. While most of the core area of the Borough has around 5 inches of annual recharge, the area around the proposed monofill (the lower Matanuska river area) is shown as receiving an average of 1.4 inches per year. A detailed review of this calculation (Kikuchi, 2014, written communication) shows that the mean annual precipitation at MAES (the Palmer Agriculture Station) during 2002-2010 (the period selected for recharge modeling) was 14.8 inches. However, the mean annual precipitation at Palmer Airport during 2002-2010 was 10.2 inches. The DPM model calculates daily precipitation at the centroid of each Hydrologic Response Unit (MRU) using an inverse distance squared weighting. The relatively low annual precipitation (11.09 in/yr) for Outlet Matanuska River HRU (190204020709) is due to the relatively low annual precipitation at Palmer Airport.

Further analyses has shown that the long-term average precipitation at the Palmer Airport is 11.89 in/yr (http://average-rainfall.weatherdb.com/l/19817/Palmer-Alaska) rather than the 10.2 in/yr modeled by Kikuchi (2013). This means that the likely recharge near the proposed monofill is likely higher than the 1.4 inches/yr modeled.

Considering annual variations and long term averages, therefore, annual groundwater recharge at the location of the proposed monofill is likely to be in the range of 1-5 inches per year. For a 30-acre surface area at the top of the fill structure, this translates to approximately 800,000 – 4 million gallons per year. This is also the amount of water that is expected to flow through the fill material and enter the water table beneath the site as leachate.

Section 7.3, Pages 20-21

This analysis probably overestimates the amount of groundwater passing beneath the site. The value of transmissivity of 100,000 ft^2/d is applicable to areas where the thickness of the aquifer is about 200 ft, which is generally somewhat north and east of the proposed monofill site. The aquifer appears to be somewhat thinner at the proposed site, only about 120 ft. The Darcy's law calculation should have assumed a relatively constant value of hydraulic conductivity similar to that estimated for other areas, of 500 ft/day. This would reflect an assumption that the aquifer materials do not change significantly across the area, only the aquifer thickness varies. Using the lower value of hydraulic conductivity of 500 ft/day, the estimated groundwater flow quantity beneath the site would be approximately 4.0 million gallons per day.

Section 8.0 Groundwater Modeling, Pages 21-25, including figures

The model presents several relatively straightforward hypothetical scenarios of contaminant fate and transport. The results are consistent with what is generally known about this site and with contaminant behavior in these types of flow systems. While the results show that concentrations of all the hypothetical contaminants would be greatly reduced, all of them are shown to persist at values greater than the respective Maximum Contaminant Levels (MCLs) for each constituent (Benzene = 5 µg/L, PCE = 5 µg/L and 1,2-DCE = 70 µg/L). Thus, the modeling shows that domestic drinking water wells could be contaminated even at distances of about a mile from the proposed monofill.

The modeling is also based on a slug input of hypothetical contaminants, which might apply to a spill or leak of a finite amount of contaminant. If there is a persistent source of contaminant such

as sometimes emanates from landfills, the plumes would not detach from the source area and long continuous plumes would tend to form from the source to the leading edge of the plume.

Another limitation of the model is that the flow field is extrapolated from hydrogeologic data collected only from the proposed site of the monofill and does not incorporate any data from downgradient areas. As hydrogeologic conditions commonly change over the distances of a mile or more, the actual conditions and fate and transport results in a downgradient direction may be different than those modeled.

The modeling conclusion that the contaminants "will essentially cease to be present in detectable concentration after only a short transport distance beyond the monofill boundaries" is incorrect and unreliable. The laboratory analyses for the three compounds measured had unusually high detection limits as a result of high dilution factors of up to 200 used in the analyses. Groundwater samples from monitoring wells do not usually have such large dilution factors, and detection limits are much lower. Benzene, for example, had an LOQ (essentially a detection limit) of 80 micrograms/liter for Residual A, however the LOQ for the sample blank used for quality assurance purposes had an LOQ of only 0.400 micrograms/liter. Recall that the MCL for benzene is 5 micrograms/liter. Thus, since groundwater monitoring samples routinely have detection limits much lower than those used in the leachate tests, the modeling fails to demonstrate that contaminant concentrations will be below detection limits or any applicable water quality standards.

Finally, such a modeling exercise may be useful for planning permit conditions for the proposed monofill. As previously noted, separation distances between the monofill and surrounding drinking watr wells may be appropriate conditions for approval of the facility. Unfortunately, there is no information provided as to the locations of surrounding wells, so planning appropriate separation distances is challenging.

The reliability of the model would be improved by obtaining and incorporating data from the groundwater flow field downgradient of the facility.

Guard Wells, Page 26
It is not clear what guard wells are contemplated. The groundwater monitoring plan was prepared prior to the modeling study and recommends only three monitoring wells, two on the west side of the fill and one upgradient. None of the proposed plan wells are located in places that would have detected any of the plumes shown in the groundwater modeling effort. The wells installed in 2013 appear to be located in areas that will be filled, so the long term use of those wells appears doubtful. Thus, it appears that the existing and/or proposed monitoring wells will be ineffective at detecting contaminants leaving the proposed monofill.

Section 9.0 Conclusions Page 26-28
There are 17 bulleted conclusions, followed by a brief concluding paragraph. For convenience, the bullets are numbered according to sequence.

Bullet 1. The site conceptual model does not provide sufficient data and analysis to adequately support this conclusion.

Bullet 2. Substantially agree, except that man-caused changes in water levels related to potential future gravel operations should be considered.

Bullet 3. Disagree. Groundwater occurs at depths of less than 10 ft beneath the current land surface, however design of the facility requires regrading to occur to create a 10-ft buffer prior to depositing waste. Recommend further analysis of seasonal high water table elevations and inspection prior to depositing waste to confirm bottom elevation of the site relative to an updated high-water table map.

Bullet 4. Disagree. Most likely closer to 4,000,000 gallons/day.

Bullet 5. Agree.

Bullet 6. Agree.

Bullet 7. Detection limits (LOQs) were far in excess of Maximum Contaminant Levels, meaning that non-detects cannot be used to rule out the presence of contaminants above MCLs. It is highly questionable that only three samples are representative of the future waste pile.

Bullet 8. It is not clear what the criteria of "properly evaluated' and "properly managed" mean. In the absence of greater clarification, it is not proper to conclude that the site meets these criteria. In particular, there is no information presented about private wells or surface water bodies in actual or potential downgradient directions and no comprehensive groundwater monitoring plan to assure protection of those wells. Lacking these details, "properly managed" could mean almost anything, including prohibition of the use of water wells for up to a mile in a downgradient direction in the absence of a more robust monitoring program and an action-plan to deal with exceedances.

Bullets 9, 10, 11, 12, 13, 14, and 15. Precipitation at the site is probably in the range of 12-15 inches/yr and infiltration is likely lower in the winter than in the summer. The remainder of these bullet points, however, are generally not supported with data and contain inaccuracies. It should be expected that 800,000 to 4 million gallons per year of water from precipitation and snowmelt will infiltrate and percolate through the waste and this fluid will become leachate that will recharge the water table both during operations and during the post-closure period far into the future. The leachate should be expected to exceed multiple water quality standards applicable to drinking water wells.

Bullets 16 and 17. These conclusions fail to note that all three contaminants could travel approximately a mile downgradient and still exceed drinking water standards, even after experiencing the modeled reductions in concentration.

Concluding Paragraph. The conclusion that the proposed facility "will not pose a threat to the underlying aquifer" is not sufficiently supported by data or analysis and should not be relied upon.

II. COMMENTS ON APPLICATION AND OTHER ATTACHMENTS

The cover letter suggests that this packet addresses the concerns expressed regarding the previous application. As detailed above, the hydrogeologic studies, monitoring plans, and inventory of surrounding wells are inadequate. The letter also states that they have obtained ADEC approval of the design. This contrasts with my understanding that a permit for this facility has not yet been granted by ADEC.

In response to the question: Will the granting of the conditional use permit be harmful to the public health, safety, convenience and welfare? (Page 1 of 3 of the MSB CUP application), the applicant answered "yes". It is not clear that this was the intent of the applicant.

The map showing adjoining property types on page 11 does not extend far enough to the south and west to show the existing land uses within the one-mile downgradient groundwater flow field described by the groundwater modeling. Other work (Munter (2010)) indicates that there are residential wells and property in this area.

The application (p. 16) relies on the report by Maddox and Associates to conclude that the "proposed monofill will not present a threat to groundwater…". As detailed above, this opinion is not sufficiently supported to be reliable.

The application (p. 16) also proposes a groundwater monitoring plan to "monitor the groundwater for any concerns long term". The monitoring plan presented does not achieve that objective. Following are samples of some concerns that are not adequately addressed:

1. What is the plan for long-term monitoring well locations, considering that some of the existing wells are in locations that apparently will be buried by fill material?

2. There are an insufficient number of wells to monitor a potential groundwater plume, considering its potential breadth (over 1000 ft wide) and complexity.

3. How will groundwater be monitored in the aquifer up to one mile downgradient of the facility that is vulnerable to contamination?

4. How will the identification of contaminated groundwater affect operations or management of the site? Who will pay for removal of the disposed material, installation of an impermeable cap, or other actions that may be needed to clean up groundwater? Who will pay for treatment systems or alternate water supplies for private well owners who may have their wells contaminated from the facility?

5. At what level, if any, will exceedance of secondary water quality standards be regarded as unacceptable? For example, an ADEC fact sheet indicates that the relevant standard for sulfate in groundwater may be natural background concentrations. (Water Quality Standards for Assessment Monitoring of Groundwater accessed at: http://dec.alaska.gov/eh/docs/sw/Monitoring/Water_Quality_Standards_Groundawter.pdf)

The leachate tests performed on sample waste material almost assure that groundwater contamination will result, if this is the applicable standard.

6. What agency will review and potentially act on groundwater monitoring results?

Comparisons to findings at other landfills in Alaska (p. 15-16) that report minimal or no environmental or public health problems are of limited value to this project. This is because of potentially large differences in geological conditions and down-gradient receptors. For example, there may be no water wells in use downgradient of the other landfills reported. The other landfills may not be situated on top of an extensive, thick, and permeable water-table aquifer.

The monitoring wells (p. 28) were installed between April 22-24, 2013. Reporting that they have been "measured over the last year" is somewhat inaccurate. The only water-table map in the packet is based on water-level measurements made on July 1, 2013, and these measurements should not have been used to determine the seasonal high water table and the base elevation of the fill. Approximately monthly measurements for a period of a full year should be used to define the peak water table, and that should be used to define the 10 feet of separation required to the base of the fill.

Below are the general standards that appear to be applicable to this site from the MSB website:

17.60.100 GENERAL STANDARDS.

(A) A conditional use may be approved only if it meets with the requirements of this section in addition to any other standards required by this chapter.

(B) In granting a conditional use permit, the planning commission must make the following findings:

(1) the conditional use will preserve or not detract from the value, character, and integrity of the surrounding area;

(2) that granting the conditional use permit will not be harmful to the public health, safety, convenience, and welfare;

(3) that sufficient setback, lot area, buffers, or other safeguards are being provided to meet the conditions listed in subsections (B)(1) through (3) of this section; and

(4) the conditional use fulfills all other requirements of this chapter pertaining to the conditional use in this section.

The Maddox and Associates report fails to present sufficient data and sound analysis to support their conclusion that the proposed use of the site does not present a threat to groundwater. Insufficient data and analysis have been provided to accurately evaluate the effects of the proposed monofill.

Should you have any questions about this review, please call me at 345-0165 or 727-6310.

Sincerely,
J. A. Munter Consulting, Inc.

GLENN HIGHWAY RECONSTRUCTION PROJECT DRAWINGS

Glenn Highway MP 34-42

DOT&PF Project No. 58104/Federal Project NH-0A1-5(24)

The Glenn Highway reconstruction project, Parks Highway to Old Glenn Highway, will reconstruct the Glenn Highway from milepost 34 to 42 to accommodate increasing traffic. It will add lanes, widen shoulders, accommodate turning movements at designated turn pockets, and add other traffic and safety improvements.

The re-evaluation of the 1993 *Glenn Highway, Parks (MP 35) to MP 109 Environmental Assessment* was completed in August 2011 for this phase of the Glenn Highway. FHWA determined there were no significant changes to the impacts identified in the *1993 Environmental Assessment*. The design phase of the project is underway and drawings are being developed to refine impacts to affected environments, properties and utilities.

The project team is available to work with adjacent property owners on design refinements.

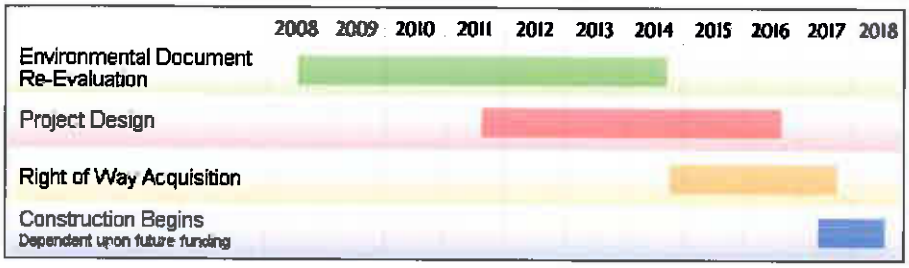
Project Schedule

Construction hinges on the results of a re-evaluation of the section from milepost 34 to 42 of the *Glenn Highway Parks MP 35 to MP 109 Environmental Assessment.*

Below is a tentative schedule of key project events.



PROJECT SCHEDULE TEXT ONLY:
Environmental Document Re-Evaluation — July 2008 to November 2014
Project Design — October 2011 to November 2016
Right of Way Acquisition — November 2014 to November 2017
Construction Begins — 2017-2018 (dependent upon completion of acquisition and availability of construction funding)

ADEC PERMIT APPLICATION

Notice of Proposal to Issue a Permit to Central Monofill Services for the Construction and Operation of an Inert Waste Monofill, Palmer, Alaska

The Alaska Department of Environmental Conservation (ADEC) has determined that the permit application, submitted by Central Monofill Services, Incorporated (CMS)for construction and operation of an Inert Waste Monofill in Palmer, Alaska, is complete. ADEC is proposing to issue SolidWaste Permit #SWZA065-19 to CMS for disposal of Construction and Demolition Debris.

APPLICANT INFORMATION:
Owner/Operator:Central Monofill Services, Inc., 311 North Sitka Street, Anchorage, AK 99501

PROJECT DESCRIPTION:
Location: The proposed monofill will be located at Mile38.3 of the Glenn Highway, on Tax Lots C10 and B6 of the Palmer Recording Districtwithin Sections 18 and 19, respectively, of Township 17 North, Range 2 East,Seward Meridian in Palmer, Alaska.

The applicant proposes operating an Inert Waste Monofill, which will be used for disposal of construction and demolition debris, either in whole or reduced in a grinder, after reusable or recyclable materials have been removed. A cell for disposal of Asbestos Containing Material will also be operated at the site.

ADDITIONAL INFORMATION:
Fora copy of the permit application, please go to dec.alaska.gov/eh/sw, or for more information regarding the Solid Waste Permit requirements or application, please contact Lori Aldrich at (907) 269-7622 or by email at lori.aldrich@alaska.gov.

OPPORTUNITY FOR PUBLIC PARTICIPATION:

ADEC is seeking comment regarding the proposed project only. Notice is given that any person interestedmay present written comments relevant to the proposed Permit to ADEC. Written comments will be included in the record if received before 5:00 p.m. on December 29, 2014.

Submit written comments regarding the project to:

Lori Aldrich, ADEC Division of Environmental Health, Solid Waste Program

555 Cordova Street, Anchorage Alaska 99501

Fax:(907) 269-7600, email: lori.aldrich@alaska.gov.

The State of Alaska, Department of Environmental Conservation complies with Title II of the Americans with Disabilities Act of 1990. If you are a person with a disability who may need a special accommodation in order to participate in this process, please contact Eric Hotchkiss at (907) 465-6171 or TDD Relay Service 1-800-770-8973/TTYor dial 711 within 30 days of publication of this notice to ensure that any necessary accommodations can be provided.

November10, 2014 dated at Anchorage, Alaska.

Inert Waste Monofill
Solid Waste Permit Application

Alaska Department of
Environmental Conservation
Division of Environmental Health
Solid Waste Program

Instructions

- This packet contains instructions and forms to complete a permit application for an inert waste monofill. This application is valid for new permits or for renewing existing permits.
- Each item must be completed and included in your application in order for the Alaska Department of Environmental Conservation (DEC) to process your permit application. Please address each item. The requested information in this form represents the minimum that is required; additional information should be provided as necessary or applicable.
- If the required information is not applicable, please explain why.
- If the required information is included in a previous application, AND the information has not changed since it was submitted, you must provide a specific reference or citation explaining where the information can be found.
- Check off each item as you complete it. Submit the entire packet, the required information, and the required application fee.
- For new facilities and lateral expansions, please prepare a draft application, develop a list of questions, and then schedule a pre-application meeting with the DEC office that will be reviewing your application materials.
- Please submit the completed application and any questions to your nearest DEC Solid Waste Program office, listed below.

Division of Environmental Health
Solid Waste Program

Part One: Fees

A check or money order for the appropriate fees must be submitted with the permit application. If the required fees are not included, the permit application will be returned to the applicant.

✓	#	Requirement	Regulatory Citation
	1	Submit a check or money order to cover the permit application review fee, as listed in 18 AAC 60.700 Table I-3, if required. *The permit application review fee is not required to be submitted with an application for permit renewal.*	18 AAC 60.210(b)(8) 18 AAC 60.700
	2	If applicable, submit a check or money order to cover waiver request fees as listed in 18 AAC 60.700 Table I-3 for any waivers requested under Part Ten of this application form.

Alaska Department of Environmental Conservation
Division of Environmental Health
Solid Waste Program

Part Two: Cover Letter and Certifications

A cover letter must be prepared, as outlined below, and submitted with the permit application.

✓	#	Requirement - letter must include:	Regulatory Citation
x	1	A statement indicating you wish to obtain a permit for an inert waste monofill.	18 AAC 60.210(b)(1)
x	2	Evidence showing that the proposed facility meets the requirements for an inert waste monofill.	
x	3	A brief general description of the site topography, geology, climate, surface hydrology and groundwater hydrology.	
x	4	A statement that you are aware of all applicable local ordinances, zoning requirements, and the ~~Alaska Coastal Zone Management Program requirements of 11 AAC 110~~.	
	5	The applicant must submit a **signed original** of the application cover letter.	18 AAC 15.030 18 AAC 60.210(a) 18 AAC 60.210(b)(2)
	6	The applicant must submit a **signed original** of the following statement, which may be added, exactly as shown in the box below, to the cover letter. As an alternative, the applicant may sign this sheet and submit it as an attachment to the cover letter.	

I, Shane Durand, certify under penalty of perjury, that all of the information and exhibits in this cover letter and application are true, accurate, and complete.

Applicant's Signature — Jan / 8 / 2013 (Month / Day / Year)

Secretary/Treasurer
Applicant's Title

Information about signatures

All permits or applications must be signed as follows, per 18 AAC 15.030:

- **Corporations**: A principal executive officer, an officer that is no lower than the level of vice president, or a duly authorized representative who is responsible for the overall management of the project or operation
- **Partnerships**: A general partner
- **Sole proprietorship**: The proprietor
- **Municipal, state, federal, or other public entity**: A principal executive officer, ranking elected official, or duly authorized employee

Part Five – Location Information

Please fill out the form where required, attach the appropriate documentation, and submit as part of the application. You may submit maps that show more than one of the required items. For example, one map can show property boundaries, nearest airport, wetland and surface water locations, etc. Please ensure that all the requested information is included in the completed application.
NOTE: Maps must have notations about sources of information, including a complete citation.

✓	#	Requirement	Regulatory Citation
	1	**Property ownership and location** information must include the following:	18 AAC 60.210(b)(3)(A) 18 AAC 60.210(b)(7)
x	(a)	Fill in a legal description of the property, with meridian, range, township and section, as well as latitude and longitude. **This property is in the Palmer Recording District. It is located on Tax Lot C10 located within Township 17 North, Range 2 East, Section 18 and Lot B6 within Township 17 North, Range 2 East, Section 19 within the Seward Meridian The approximate latitude is 61.558075° N, and longitude 149.170432°W.**	
x	(b)	Fill in an informal location description such as mileposts, landmarks, distance and direction from nearest community. **This site is located at Mile Post 38.3 of the Glenn Highway. It is approximately 3.5 Miles southwest of Palmer, Alaska and 10 miles East of Wasilla.**	
	(c)	Attach a copy of the deed or another legal document that identifies the landowner.	
	(d)	If the applicant is not the landowner, attach a written and notarized statement signed by the landowner showing that the landowner consents to the landfill, or a copy of any lease agreement that is relevant to the proposed activity.	
x	(e)	Attach a map or aerial photo that shows the location of the landfill property boundaries. **See Figure A**	

Part Five – Location Information (continued)

✓	#	Requirement:	Regulatory Citation
x	2	**Surface water** information must include:	18 AAC 60.210(b)(3)(B) 18 AAC 60.210(b)(3)(D) 18 AAC 60.225
x	(a)	Fill in information about any potential for surface water to enter the site from upgradient areas. **The historical gravel mining activities at the site have left the majority of the site lower than the surrounding lands. There are no streams or conveyance channels running onto the project site. There are three existing gravel ponds onsite. Sheet flow will direct 90% of the drainage towards a basin. The other flows will be on vegetated slopes.**	
x	(b)	Attach a map or aerial photo that shows the location of surface water bodies and streams within 200 feet of the landfill boundary. **See Figure A**	
	3	**Permafrost** information must include:	18 AAC 60.210(b)(3)(B) 18 AAC 60.227
x	(a)	If the landfill is located on permafrost, fill in information to explain why there is no practical alternative to the site chosen. **Permafrost has not been encountered at any time on site during historical use.**	
x	(b)	If the landfill is in an area of discontinuous permafrost, attach a map or aerial photo that shows the location of the boundary of any permafrost within 200 feet of the landfill boundary. **This area of Palmer is in a sporadic permafrost zone so the likelihood of permafrost at this site is low. See attachment B, permafrost characteristics map**

Solid Waste Permit Application

Alaska Department of
Environmental Conservation
Division of Environmental Health
Solid Waste Program

Part Six – Facility Design

A complete set of design drawings must be submitted showing all the information in the following table, with drawings included for both the design and closure of the landfill, as appropriate. Landfill drawings should be organized as shown below, with design drawings placed in the first part of the drawing set and closure drawings included at the end of the drawing set. It is understood that landfill closure design drawings will be conceptual only. NOTE: Supporting calculations and data for both the design and closure of the landfill must be attached to the permit application and include the information shown in the following table.

✓	#	Requirement – engineering drawings must include, at a minimum:	Regulatory Citation
LANDFILL DESIGN DRAWINGS:			18 AAC 60.210(b)(3) 18 AAC 60.220 18 AAC 60.233
	1	**Site map(s)** which show site conditions including:	
x	(a)	All previous, existing, and planned disposal areas; the drawing should demonstrate that waste will be at least 50 feet from property boundary.	
x	(b)	Fences, gates, berms, and other access control devices around the facility.	
x	(c)	Access roads to and within the facility.	
	2	**Plan view drawings** with contour lines and cross sections including:	18 AAC 60.210(b)(3) 18 AAC 60.210(b)(4) 18 AAC 60.410(b)(2) 18 AAC 60.410(c)
x	(a)	Any planned excavations before waste cell construction.	
x	(b)	All roads, ditches, trenches, and berms associated with the landfill.	
	3	**Construction detail drawings** and cross sections including:	18 AAC 60.210(b)(3)(B) 18 AAC 60.225 18 AAC 60.410(b)(2) 18 AAC 60.410(c)
x	(a)	Storm water drainage structures, culverts, and other surface water control devices.	
LANDFILL CLOSURE DRAWINGS:			18 AAC 60.210(b)(3)(E)
x	4	**Conceptual drawings** of the facility after closure is completed.	
DESIGN CALCULATIONS, DATA, AND DOCUMENTATION:			18 AAC 60.210(b)(3) 18 AAC 60.210(b)(4) 18 AAC 60.210(c) 18 AAC 60.227(b) 18 AAC 60.410(c)
x	5	**Design calculations, data, and documentation** must include:	
x	(a)	Information and/or calculations showing how the facility will be protected from any reasonably anticipated natural event such as aufeis, floods, earthquakes, thawing of unstable permafrost, and the effects of freezing and thawing.	
	(b)	If located on permafrost, documentation showing that the permafrost will remain frozen to the greatest extent practical.	
x	(c)	Information and calculations that substantiate the size and expected usable life of the facility.	
x	(d)	Printouts of inputs, assumptions, and outputs from any computer model used to support the facility design.	
x	(e)	An estimate (including calculations) of the maximum inventory of inert wastes that will be disposed onsite over the life of the facility.	
x	6	For landfills accepting more than 5 tons per day of waste, all design documents must be stamped and sealed by a registered engineer.	18 AAC 60.210(c)

Inert Waste Monofill
Solid Waste Permit Application

Alaska Department of
Environmental Conservation
Division of Environmental Health
Solid Waste Program

Part Seven – Operations Plan

The operations plan should provide sufficient detail and information that a landfill operator could use to perform all required tasks for day-to-day operation of the landfill. The operations plan is a flexible document that should be reviewed annually and updated/modified, as necessary. The following table represents the minimum requirements to be included in an operations plan. Additional information should be added, as needed, to ensure the facility operates in compliance with the State Solid Waste Regulations. A copy of the operations plan should be kept at the landfill facility.

✓	#	Requirement - operations plan must include:	Regulatory Citation
	1	**Access control** - must include a description of how:	18 AAC 60.210(b)(3)(C) 18 AAC 60.220
	(a)	access to the facility will be controlled, including gates, fences, berms, or other means of preventing access, hours of operation, signage, and other control measures.	
	(b)	prohibited activities such as target practice or off road vehicle use will be prevented.	
	(c)	access and onsite roads will be kept passable and safe for vehicles year round.	
	2	**Waste acceptance and handling policy** must include a description of:	18 AAC 60.210(b)(3)(C) 18 AAC 60.240(a) 18 AAC 60.240(b) 18 AAC 60.420(b)
	(a)	waste screening procedures to ensure no prohibited or unacceptable wastes are disposed in the facility.	
	(b)	any signage placed at the facility entrance.	
	(c)	any waste processing procedures prior to disposal.	
	3	**Waste placement plan** must include a description of:	18 AAC 60.210(b)(3)(B) 18 AAC 60.210(b)(3)(C) 18 AAC 60.225(a)
	(a)	waste placement methods.	
	(b)	planned progression of the working face, including landfill development over the life of the facility (diagrams are acceptable).	
	(c)	how unstable slopes will be avoided.	
	4	**Non-RACM waste placement plan** must include a description of:	18 AAC 60.210(b)(3)(B) 18 AAC 60.210(b)(3)(C) 18 AAC 60.450(a)
	(a)	waste placement methods to ensure non-RACM will not become friable during handling or placement.	
	(b)	Placement and frequency of cover material. NOTE: Non-RACM waste must be covered within 24 hours of placement.	
	5	**Litter, vector, and nuisance control plan** must include:	18 AAC 60.210(b)(3)(C) 18 AAC 60.210(b)(3)(D) 18 AAC 60.230(a) 18 AAC 60.233(2) 18 AAC 60.420(a) AS 46.06.080
	(a)	procedures to ensure wildlife and domestic animals do not endanger the public or landfill staff, are not harmed by contact with the waste, and do not become a nuisance.	
	(b)	procedures to control dust, odor, noise, traffic, litter, disease vectors, and other effects from facility operations so they do not become a nuisance or hazard outside of the facility boundary.	

Part Seven: Operations Plan (continued)

✓	#	Requirement - operations plan must include:	Regulatory Citation
	6	**Corrective action plan** must include procedures for immediately:	18 AAC 60.210(b)(3)(C) 18 AAC 60.210(b)(3)(D) **18 AAC 60.460(d)** 18 AAC 60.815(a)
	(a)	o cleaning up any improper or unauthorized waste disposal; o repairing any damage to the facility or structures; o addressing any violations of regulations or permit conditions; and o responding to combustion or a fire within the inert waste.	
	7	**Operating record** – Please state where the operating record for the facility will be kept. NOTE: The operating record must contain all documentation listed in 18 AAC 60.235, and be retained in a location readily accessible to DEC and facility employees. **Central Monofill Services Incorporated** **311 N. Sitka Street** **Anchorage, AK 99501**	18 AAC 60.235

Inert Waste Monofill
Solid Waste Permit Application

Alaska Department of
Environmental Conservation
Division of Environmental Health
Solid Waste Program

Part Eight – Monitoring Plan

The monitoring plan must include sufficient detail to adequately perform all tasks required for field monitoring and sampling, submit samples to a laboratory with a complete list of parameters to be analyzed, and prepare a monitoring report with all of the information required by DEC.

✓	#	Requirement – monitoring plan must include:	Regulatory Citation
	1	**Visual monitoring plan**. Must include:	18 AAC 60.210(b)(3)(D) 18 AAC 60.800(a)
	(a)	A description of the procedures for visual monitoring of the landfill.	
	(b)	A checklist or visual monitoring form including all items in 18 AAC 60.800(a).	
	2	**Surface water monitoring plan** (if required by DEC) must include: N/A	18 AAC 60.210(b)(3)(D) 18 AAC 60.810 18 AAC 60.840
	(a)	Brief information about topography and surface water flow at the landfill.	
	(b)	A detailed map showing permanent sampling site locations.	
	(c)	Identification and information about background and compliance sampling sites, including documentation showing why the site was chosen.	
	(d)	Specific information about sampling frequency and schedules.	
	(e)	A proposed list of constituents for which samples will be analyzed.	
	(f)	Detailed monitoring procedures outlined in 18 AAC 60.810(e).	
	(g)	A statement that monitoring reports will be submitted to DEC within 60 days of receiving laboratory data or by the date(s) stipulated in the permit.	
	3	**Groundwater monitoring plan** (if applicable) must include: N/A	18 AAC 60.210(b)(3)(D) 18 AAC 60.217 18 AAC 60.460(c) 18 AAC 60.820 18 AAC 60.825 18 AAC 60.830
	(a)	Information about hydrology at the landfill including depth to groundwater, direction and velocity of flow, with supporting documentation.	
	(c)	Information about background groundwater quality.	

Part Nine - Closure Plan and Cost Estimate

It is understood that the closure plan submitted with the permit application is conceptual, and may change throughout the active life of the facility. If the landfill is within 5 years of closure, a detailed closure plan must be submitted and approved by DEC.

✓	#	Requirement - closure plan must include:	Regulatory Citation
	1	**A description of the closure process** for the facility must include:	18 AAC 60.210(b)(3)(E) 18 AAC 60.210(b)(6) 18 AAC 60.245 18 AAC 60.270 18 AAC 60.460(e) 18 AAC 60.490
X	(a)	A description of the final cover and appearance of the facility meeting the standards of 18 AAC 60.460(e).	
X	(b)	A description of the methods and procedures for final cover installation.	
X	(c)	A timeline or schedule for all activities needed to complete closure.	
X	(d)	A description of the anticipated post closure (future) use of the property.	
X	(e)	A description and map of proposed survey monuments or permanent markers.	
X	(f)	A statement of how DEC will be notified that the requirements of 18 AAC 60.270 and 18 AAC 60.490 have been met.	
	2	**Financial information** (if required by DEC) must include:	18 AAC 60.210(b)(5) 18 AAC 60.210(b)(3)(F) 18 AAC 60.265
X	(a)	The total present-day equivalent cost estimates for closing the facility.	
X	(b)	The total present-day equivalent cost estimates for post-closure care of the facility.	
	(c)	Detailed proof of financial responsibility to cover the cost of closing the landfill and post closure care.

January 8th, 2012

Alaska Department of Environmental Conservation
Division of Environmental Health - Solid Waste Program
555 Cordova Street
Anchorage, AK 99501

Mr. Nathaniel Emery;

The purpose of this letter is to inform the Alaska Department of Environmental Conservation that I, Shane Durand, Secretary/Treasurer of Central Monofill Services Inc., wish to obtain a permit to operate an inert waste monofill. The proposed facility for which this permit is being sought is 120 acres located on tax lot C10 located within Township 17 North, Range 2 East, Section 18 in the Seward Meridian and tax lot B6 located within Township 17 North, Range 2 East, Section 19 in the Seward Meridian in Palmer, Alaska 99645. Evidence showing that the proposed facility meets the requirements for an inert waste monofill can be found in the attached permit. Furthermore, I hereby state that I am aware of all applicable local ordinances, and zoning requirements. The following provides a description of the climate, topography and hydrology at the site.

Palmer, Alaska where the proposed monofill is located is characterized by mild summers and cold winters, with summer high temperatures averaging approximately 67°F and winter high temperatures averaging 20°F. Annual precipitation averages 15.49 inches per year.

Lot C10 is in the South West corner of Section 18 and Lot B6 is north of the Glenn Highway in the North West corner of Section 19. The site has historically been used as a Gravel Pit. The site contours vary greatly as different sections of the lot have been mined for gravel. The surrounding slopes are at the natural angle of repose for the material, in some cases as steep as 2:1 (See Attached Planset, Sheet 1, existing conditions). This monofill will occupy 35.5 acres over lots C10 and B6 and maintain a 100' buffer from the existing industrial ponds located on the lot. The depth of groundwater at the site varies as shown on the Palmer Pit Water Table Contour Map. The bottom of the waste will always remain a minimum of 10' above the groundwater.

The site has been traditionally used as a gravel pit, so the soils onsite vary from some well graded, sandy gravel material to areas of unusable for mining materials such as clay and silt. The industrial ponds onsite are as deep as 80 feet. Permafrost has not been encountered at any time on site during historical use and the area of Palmer is in a sporadic permafrost zone so the likelihood of permafrost at this site is low. Due to the composition of soil containing well graded gravel, the percolation rate at the site is moderate to high. The nearest water bodies are the three industrial ponds onsite. They are manmade industrial ponds caused by past industrial gravel dredging. These bodies do not have inflowing or outflowing water and are fed from onsite surface flow and groundwater. The Matanuska River lies approximately 2 miles to the southeast and this river ultimately discharges into the ocean in the Knik Arm approximately 4.5 Miles southwest.

I, SHANE DURAND, certify under penalty of perjury, that all of the information and exhibits in this cover letter and application are true, accurate, and complete.

Applicant's Signature — Jan (Month) / 8 (Day) / 2013 (Year)

Project Description

CMS's goal for this Inert Waste Monofill, is to have Central Recycling Service, Inc. (CRS) properly place and cover inert debris on a portion of the property, while maintaining and reclaiming a 120 acre site located on Lot C10, Located in Township 17 North, Range 2 East, Section 18 and Lot B6, Located in Township 17 North, Range 2 East, Section 19 in Palmer, Alaska 99645.

Lot C10 is in the South West corner of Section 18 and B6 Adjacent just South of C10. The site has historically been used as a Gravel Pit. The site contours very greatly as different sections of the lot have been mined for gravel. The surrounding slopes are at the natural angle of repose for the material, in some cases as steep as 2:1 (See Attached Plan set, Sheet 1, Existing Conditions). This monofill will occupy 35.4 acres in the southwest corner of the lot C10 and all of Lot B6 north of the Glenn Highway and maintain a 100' buffer from the existing gravel ponds located on the lot C10. The groundwater at the site varies across the site with water elevations close to 85 feet in the northeast corner and down to 70 feet in the south corner. The depth to ground water at specific locations varies significantly due to the widely varying terrain at the site.

The site has been traditionally used as a gravel pit, so the soils onsite vary from some well graded, sandy gravel material to areas of unusable for mining materials such as clay and silt. The industrial ponds onsite are as deep as 80 feet. Permafrost has not been encountered at any time on site during historical use and the area of Palmer is in a sporadic permafrost zone so the likelihood of permafrost at this site is low. Due to the composition of soil containing well graded gravel, the percolation rate at the site is moderate to high. The nearest water bodies are the three industrial ponds onsite. They are manmade industrial ponds caused by past gravel dredging. These bodies do not have inflowing or outflowing water and are fed from onsite surface flow and groundwater. The Matanuska River lies approximately 2 miles to the southeast and this river ultimately discharges into the ocean in the Knik Arm approximately 4.5 Miles southwest.

Access Control

The driveway for Lot C10 is located off of the Glenn Highway and currently has a two driveway configuration that will be used as an entrance/exit configuration. It is the only access point for the inert debris monofill on the site. Signage will be posted informing the public of the monofill operation, private property, not to trespass and/or not to enter the site unless authorized or accompanied by authorized personnel. This access point will prevent unsolicited visitors to trespass onsite (pedestrians/target practice/off-road vehicle usage) and away from any site activities. There will also be a gate and fence that extends up the natural berm surrounding the entrance.

The driveway is currently permitted through DOT&PF since the driveway extends into the Glenn Highway ROW.

Permit: *Alaska DEC, Solid Waste Program*
Applicant: *Central Monofill Services, Inc.*
Date Submitted: *January 8, 2013*

Seasonal Start and End Dates

This site will be operated year round.

Hours of Operations / Days of the Week

The operational hours will generally be from 7am to 7pm, Monday through Saturday.

Waste Acceptance and Handling Policy

The inert debris brought to this site will be primarily shredded residual, recycling waste, material. Shredded residual material is a variety of non-hazardous, inert material which is shredded to a size of 12 inches or smaller. This material is the by-product of a recycling facility located in Anchorage, Alaska called Central Recycling Services. Central Recycling Services (CRS) specializes in recycling inert construction and demolition waste. The material brought to CRS is both manually and mechanically sorted, screened and processed through to ensure the material is free of hazardous material, putrescible material and/or liquids. The shredded inert material will be placed in a trailer and used as the inert debris for this monofill

Material that will not be accepted at this monofill location will be as follows:

- PCBs or other Hazardous Wastes
- Household Waste
- Putrescible Waste
- Liquids
- Compressed Gas Cylinders
- Batteries
- Appliances with CFC/HCFC
- Chemical Waste
- Animal Carcasses
- Petroleum Contaminated Materials

It is Central Recycling Services' policy to require additional documentation from all material haulers transporting any demolition and/or renovation material to the Central Recycling Services' Facility.

The additional information required is: (1) A copy of all Hazardous Building Material Surveys for each project that will be bringing their demolition and/or renovation material to the Central Recycling Facility. Should the Survey indicate the presence of any hazardous materials, then (2) A letter from the Contractor of each project is also to be submitted to Central Recycling Services stating that all hazardous material have been properly removed from the project, and there is no hazardous material being brought to the Central Recycling Facility. For their operations, CRS defines hazardous material as a material containing any percentage of asbestos.

Any demolition and/or renovation material brought to the CRS Facility is not allowed to be dumped onto the Tipping Floor until both of the above mentioned documents have been provided to and reviewed by the authorized CRS employees. When delivered, any material identified in the survey will be searched for within the waste.

Please note that CRS is not open to the public. All customers/haulers are pre-approved and have signed credit applications including indemnity. By signing this document, they acknowledge that hazardous material is not accepted at the CRS Facility.

These policies in place at CRS will help to reduce the risk of prohibited items or contaminates from reaching the monofill.

Although the CRS residual material is the primary material to be deposited at the monofill some inert material will be hauled directly to the monofill without being processed at the CRS recycle facility. These materials will require the same documentation and have the same scrutiny as those delivered directly to CRS.

Fire Mitigation Procedures

Exothermic reactions have been shown to be problems in landfills that accept organic materials. Exothermic reactions occur when organic materials are confined in a moist environment. Therefore the following procedures will be implemented during construction and operation of the landfill to mitigate the potential for exothermic reactions that could cause a fire.

Control of Organic Material:

- No organic soils will be allowed to be in contact with any of the inert debris or tire bales used in the landfill.
- No organic materials other than dry wood construction debris will be allowed in the landfill.
- Only clean tire bales (no organic debris attached) will be used for construction of berms or subgrade structural fill.

Control of Moisture:

- Only dry or damp debris will be allowed to be buried in the landfill. If wet debris are brought to the landfill, they'll be dried prior to being buried in the cell.
- Up gradient run off will be controlled by interception ditches to prevent any storm water runoff from entering the active cells.

Regular Inspections:

- Each day of operation in the landfill the cells will be inspected for evidence of heat or steam rising out of the cells which may be an indication of an exothermic reaction occurring. If an exothermic reaction is suspected the area will be opened and exposed to the air to be dried out.

Limitation to Sub-Cell (lifts) Depths:

- The depth of each sub-cell (or lift) is limited to 15 feet to allow access to the bottom of the lift with commonly available excavation equipment. Due to the long period of time between cell lift completions (anticipate ~1 year each) all areas of the active cell will be accessible for relatively long period of time for regular monitoring.

Corrective Action Plan

As previously mentioned, the shredded residual material will be sorted through at Central Recycling Services before the inert material is brought to the monofill site. Therefore, it will not likely be necessary to clean up any prohibited or unauthorized waste since there will not be the possibility of hazardous or unauthorized waste being inadvertently brought to the monofill.

The Facility at CRS abides by all regulations and permit conditions regarding inert debris handling, placement and sorting of material, therefore no violations of waste disposal or improper processing will take place at the monofill.

However, if somehow some unauthorized hazardous waste is brought to the landfill that waste will be segregated, reported, and handled like an orphan hazardous waste that shows up on any property. ADEC will be notified and HAZWOPER trained crews will be dispatched to properly control and contain the waste.

Should the unlikely event of a fire occur within the inert waste, there will be fire barriers throughout the monofill. These fire barriers will consist of 12 inch thick soil barriers to act as fire retardants and prevent the fire from spreading from Cell to Cell through the entire monofill. There will also be one foot thick soil barriers between the tire bales retaining structures in each Cell to reduce the possibilities of any fire hazards. For small fires the initial attempts will be to quickly extinguish the fire, using on-site fire extinguishers, before the fire spreads into the waste materials.

If the source of the fire is from an exothermic reaction, then the following actions will occur to control the fire:

- The location of the exothermic reaction will be identified.
- A site specific fire fighting plan will be immediately developed to address the situation which may include the following options:
    - The impacted materials may be dug up and exposed to air to dry out.
    - The cell with the exothermic reaction may be flooded with water to reduce the reaction rate. (use on-site industrial well)
    - Depending on where the fire is located, specific measures will be developed to prevent the spread of the fire to or in the tire bales.

In the unlikely event the fire ignites the tire bales, the local fire department will be notified to monitor and control the fire.

Permit: *Alaska DEC, Solid Waste Program*
Applicant: *Central Monofill Services, Inc.*
Date Submitted: *January 8, 2013*

There currently are no structures near the monfill that need to be protected. In the future a scale and scale house will be located near the entrance to the site. The scale and scale house will be located approximately 150' to 200' away from the toe of the monofill. A warm storage building may be added in the future as shown on Sheet 2. Types of equipment that may be onsite: Excavator, Loader, Compactor, Dozer, End Dumps, Truck and Trailer. There is to be a designated fueling area for all equipment to be maintained and fueled on an as-needed basis. This will be located within the Storage area shown on Sheet 2. This area shall also serve as parking for employee vehicles, parking and staging areas for equipment, and staging/storage area for materials. All material will be properly protected and stored.

Waste Placement Plan

The inert material will be placed to fill the natural and manmade voids of this property and take advantage of all the onsite features like existing material berms and valleys.

Before material is placed in the monofill, the bottom layer of the cells will be established using groundwater information. The bottom of the cell will located a minimum of 10' above the established groundwater levels.

In order to recycle tires, build embankments and prevent unstable slopes, tire bales will be used for the purpose of containing inert debris within the limits of the Monofill on the south ½ of the site. They may also be used as structural berms on the North, East and West sides of the fill. Much of the Southeast and Southwest sides of the fill will be located next to natural berms and will require no structural support. CRS will maintain a six inch to one foot of soil separation between each Cell's tire bales to create multiple fire barriers throughout the monofill in the unlikely case of a fire.

Please Refer to Sheet 5, Operations plan for a visual guide to the description below: Cell A will be the first cell to be filled. As per detail 2 on sheet 5, the bottom of the monofill will be established 10 feet above the measured groundwater table. The cell will be built vertically and natural material from the north edge of Cell A and all of Cell J will be used as lift separation material. Cells A and F will be constructed first along with establishment of Cell C as the ACM cell. As Cells A and F progress to a median target elevation (approximately 105' local), Cells G and B will begin to be constructed. The same process will occur to Cells D and H, and then E and I. Once the target elevation is established, construction will move back to Cells A and J and the previous described process will begin again until another lift is completed.

During the above process the following general practices shall apply: The roadway/working area will be wide enough to allow at least two vehicles to pass by one another. The trucks will drive to the end of the operating Cell, turn around, and backup into the most accessible area, then dump its material. As the trucks dump each load of material,

the heavy equipment will then organize and compact the placed debris within the operating Cell.

After each Cell lift is filled completely, a bulldozer will spread 6-12" of excess soil, strippings and non-organic overburden on top of the Cell's inert debris creating a fire barrier. This material will also be spread over and in between the tire bale wall of the Cells to help create a visibly pleasing surface as well as promote the revegetation and growth of native plants.

As sections of the monofill become completed, 24 inches of native or imported soil will be spread over the top to serve as a cap and to allow the reestablishment of vegetation on the site within a reasonable period of time. If the soil cannot support plant growth, 4 inches of topsoil will be imported to promote healthy growth and revegetation of slopes. See Sheet 3 of the plans for slope grades and locations. The slopes will be 2:1 at their steepest when reinforced with tire bales, and 3:1 or less everywhere else. The monofill will all be stabilized to a condition that will allow sufficient moisture to be retained for natural revegetation to occur on site within the next five years.

The placement of inert material is proposed to be a continuous process over the period of approximately twenty five years.

Asbestos Waste Placement Plan (RACM)

Regulated Asbestos Containing Material (RACM) waste will be accepted at the monofill site. All waste that includes regulated asbestos-containing material (RACM) waste will be managed in a manner that prevents the release of asbestos fibers to the air or to surface water and must be disposed of in an approved cell (such as Cell E). The base of the asbestos will be undisturbed earth or stable fill. The cell is located in a manner that it will not preclude any future closeout or remedial action at the facility.

The CRS operator shall inspect each load of RACM waste to assure that the friable asbestos material is sealed in leak-proof bags or containers, labeled in accordance with 29 CFR 1910.1001(j)(4), revised as of July 1, 1998. The waste will be accompanied by a complete and accurate shipment record meeting the requirements of 18 AAC 60.

At the end of each operating day, or at least once every 24 hours while disposal of RACM waste is occurring, the operator shall cover RACM waste that has been deposited at the landfill during the operating day or previous 24 hours with at least six inches of non-RACM material.

CRS will retain a copy of all records required under 18 AAC 60.450 for at least two years, and shall furnish them to the department upon request.

Permit: *Alaska DEC, Solid Waste Program*
Applicant: *Central Monofill Services, Inc.*
Date Submitted: *January 8, 2013*

CRS will maintain in the operating record of the landfill a map or diagram showing the boundaries of the asbestos waste management area, its depth, and the amount, in cubic yards, of the RACM waste located there. These will documents will be maintained until the landfill closure is complete.

If excavation of the RACM material is needed for any reason, CRS will submit a work plan prepared in accordance with 18 AAC 60 for approval at least 45 days before excavating or otherwise disturbing any asbestos-containing waste material that has been deposited at the landfill and covered. Department approval of the work plan is required before excavation may begin. If the excavation will begin on a date other than the one contained in the approved work plan, notice of the new date must be provided to the department at least 10 working days before excavation begins. Excavation may not begin earlier than the date specified in the approved work plan.

Non-RACM Waste Placement Plan

Non-Regulated Asbestos Containing Material (Non-RACM) waste will also be accepted at the monofill site.

The majority of the Cells within the monofill will be filled with non-hazardous, inert debris; but when the disposal of Non-RACM is needed, a sub-Cell will be created. When a load of Non-RACM is brought to the monofill, the following process will occur.

The monofill Operator will prepare the operating Cell for the Non-RACM load. The Operator will make a separate Cell within the operating Cell, creating a sub-Cell. Each sub-Cell will be surveyed and the location documented for future reference. To ensure the non-RACM will not become friable during the handling or placement, the sub-Cell will be properly covered, as required for Non-RACM disposal, within the first 24 hours of placement in the monofill with one foot of the CRS Daily Cover. If and when necessary, additional cover will be applied to the Non-RACM sub-Cells to provide the minimum of one foot of cover at all times.

Litter, Vector and Nuisance Control Plan

Throughout each Cell, the equipment will spread Daily Cover, when necessary, to ensure the monofill is properly maintained. This Daily Cover is called Alternative Daily Cover, consisting of material (other than earthen material) that is placed on the surface of the operating Cell of the monofill when needed, to control the unlikely event of fires, odors, blowing litter and scavenging. This Daily Cover will be brought from Central Recycling Services.

Due to the debris being inert, there is no concern for wildlife or domestic animals to be attracted to the inert debris landfill and its operations. Neither odors and/or diseases will be issues on or off site as none of the debris will be putrescible.

Permit: *Alaska DEC, Solid Waste Program*
Applicant: *Central Monofill Services, Inc.*
Date Submitted: *January 8, 2013*

CRS plans on preventing any problems or issues that may occur on adjacent properties by using berms, grading plans, dust control and Storm Water Pollution Prevention (SWPPP) techniques throughout the disturbed areas on site. Existing Earth Berms on the South and West sides of the property will not only decrease the visual difference of the property, but to act as a buffer and prevent any material from leaving the site and travel onto any neighboring properties. The North and East sides of the monofill have ~1000' between the toe and a neighboring property. If any issues with blowing debris occur, CMS will implement a plan to combat this including earthen berms and chain link fence.

CRS will provide grading plans and implement the SWPPP for all ground disturbing activities. By applying these SWPPP techniques with the grading plans, this will lessen the amount of water movement on site and will ensure the very limited water discharge off of this property meets water quality criteria. The project is designed to have all water infiltrate the permeable gravel soils or drain into the drainage basin composed of industrial water. Should dust become an issue on site, CRS has access to available water trucks when needed.

The existing surrounding land uses within one mile around or adjacent to Lot C10 include: single family residential homes to the West, industrial mining operations to the Northeast, and Southeast and privately owned farming/agricultural due east. This property has been used for gravel mining operations in the past so CMS's future purpose for these properties and these plans will not interfere with the neighboring lands' uses or activities.

The initial projected average daily truck count is about 12, with truck counts of up to 25 per day for short periods of time. Gravel extraction haul trucks use the existing driveway located on Lot C10 and have historically had much larger volumes of trucks on a daily basis. CMS has Grandfather Rights to the driveway and gravel permit. It is not anticipated that a noticeable increase will occur in the noise or the truck traffic on the Glenn Highway.

Monitoring Plan

Due to the inert material being placed in this landfill and the drainage plan, no surface water or ground water is expected to be impacted. Visual inspections will occur on a regular basis following the attached inspection checklist. While limited daily inspections will be conducted whenever the landfill is in operation, at a minimum monthly inspections will be conducted following the entire checklist by a person familiar with all the permit requirements.

Permit: *Alaska DEC, Solid Waste Program*
Applicant: *Central Monofill Services, Inc.*
Date Submitted: *January 8, 2013*

Operating Record

The operating record for this monofill will be kept on-site and a copy of this documentation will be kept at the CRS Facility located at the below address:

Visual Monitoring Checklist

Facility Name:	**CMS Palmer Monofill, Palmer, Alaska**
Inspector:	
Date:	

Evaluate each item and check whether acceptable (A) or unacceptable (U). Complete any required information, and make notes on the conditions observed, as well as any corrective actions taken. Keep these forms available for use in completing the annual and closure reports for this facility.

A	U	Notes
		Are there any sings of damage or potential damage caused by or may cause settlement, ponding, leakage, thermal instability, frost action, erosion, or otherwise affect operations at the site?
		Is there any damage to any monitoring equipment (may not be applicable)?
		Is there any evidence of waste leachate escaping the site?
		Is there any evidence of unauthorized disposals?
		Is there any evidence of unauthorized types of waste within monofill?
		Is there any evidence of any other permit or regulation violations?
		Is there any evidence of erosion or other damage to the integrity of the containment system (i.e. berms, erosion control devices, diversion structures)?
		Are there any signs of sloughing?
		Is there any evidence of ponding or accumulation of standing water?

		Is there any evidence of steam, excess heat, fire or combustion within the waste?
		Is there any evidence of death or stress to wildlife, or vegetation that might be caused by the facility?
		Is run-on water properly contained or diverted around the waste so that water does not enter the pile or cell?
		Are storm water BMPs properly installed in in good operating condition?
		Did any Storm Water BMPs require maintenance, repair, or replacement? If yes describe below
		Were changes or modifications to storm water BMPs illustrated on the Storm Water Site Map?
		Is there evidence of pollution discharges since the last inspection?
		Are storm water discharge locations free of sediment?
		Are sloped areas properly stabilized?
		Are sufficient spill response supplies on site?
		Is vehicle and equipment fueling area free of leaks, spills and other deleterious materials

A new permafrost map of Alaska, using a terrain-unit approach for mapping permafrost distribution based on climate and surficial geology is presented in conjunction with the Ninth International Conference on Permafrost held at the University of Alaska, June 29 to July 3, 2008. This map represents the third iteration of a permafrost map for Alaska, following the circum-arctic permafrost map (Brown et al. 1997), which made minor modifications to the initial map by Ferrians (1965). To map permafrost, we developed a rule-based model (see color-coded table) that incorporated mean annual air temperatures (MAAT) from the PRISM climate map and the surficial geology map (see back), of Karlstrom et al. (1964). We used terrain-permafrost relationships developed by Kreig and Reger (1982) and our knowledge of permafrost distribution to assign permafrost characteristics to each surficial deposit under varying temperatures. Surficial geology greatly affects permafrost characteristics because of differences in topography, soil texture (which affects moisture and thermal properties) and hydrology (surface-water and groundwater). We modified the surficial geology map to update some areas with new information (e.g., extinct loess and sand, and glaciomarine deposits).

We coded the permafrost map with surficial geology, MAAT, primary soil texture, permafrost extent, ground ice volume, and primary thermokarst landforms. The map focuses on the top 10 m of permafrost, where permafrost can be more readily mapped from surface features, determined by simple field measurements, and where ground ice usually is most abundant. Distribution of permafrost shown on the map is therefore also based on our knowledge about the presence or absence of permafrost within the upper 10 m. Although we used recent MAAT in our rule-based model, we note that permafrost distribution is greatly affected by past climates.

We relied on many sources for the effort but are not able to cite all references here. The main map shows permafrost thickness values based on MacCarthy (1952), Brewer (1958), Ferrians (1965), Péwé (1975), Osterkamp and Payne (1981), Lachenbruch et al. (1987), and Collett et al. (1989). Depths were determined by temperature logging or interpretation of ice-bearing permafrost from geophysical data. Southerly sites are included where the presence of permafrost is evident even if permafrost thicknesses were not determined.

The following characteristics are shown on small thematic maps on the reverse side of the main map.

Ground temperatures (usually measured at depths 20-30 m) were obtained from boreholes by V. Romanovsky, G. Clow, K. Yoshikawa, and T. Osterkamp as part of the Thermal State of Permafrost project for the International Polar Year (Brown and Romanovsky 2008). Only recent data are used.

Ground ice volumes were estimated for the upper 5 m of permafrost using terrain relationships established by Kreig and Reger (1982) and our field data. Ground ice volume near the surface is higher in colder regions due to active ice-wedge formation and ice segregation in fine-grained deposits. Buried glacial ice in old or stagnant young moraines is included, but is irregularly distributed at this map scale.

Pingo distribution was compiled mostly from Holmes et al. (1968), Galloway and Carter (1978), and Walker et al. (1985) and by satellite image interpretation. There are >1500 known pingos in Alaska. In central Alaska and nearby Yukon areas, there are ~700 pingos, mostly open-system. Closed-system pingos predominate in the North Slope, Seward Peninsula, and Nextak regions. Not all pingos have been inventoried.

The distribution of ice wedges was determined from the literature, from polygonal patterns evident on remote sensing imagery, and from our field experiences. Ice wedges actively form mainly in the continuous permafrost zone, and are inactive to weakly active in the discontinuous zone (Péwé 1975). Holocene ice wedges, which are limited to the top 3-5 m of permafrost, are smaller than large, deep (up to 35 m) syngenetic ice wedges formed during the Late Pleistocene. Symbols for abundant ice wedges denote general locations, whereas, symbols for sparse Holocene and Late Pleistocene wedges indicate specific areas, though distribution remains poorly known.

Thermokarst landforms are abundant in all permafrost zones (Jorgenson et al. 2008). They are varied, due to differences in temperature, ground ice volume, soil texture, slope, and hydrologic conditions. Abundance of thermokarst is difficult to map because of the wide range in size of features from small pits to large lakes, and similar landforms may have different origin.

The permafrost zones underlie 80% of Alaska, including continuous (32%), discontinuous (31%), sporadic (8%), and isolated (10%) permafrost. Glaciers and ice sheets occupy 4% of the area.

Many improvements are needed for a better permafrost map, including: a surficial geology map with updated information and better spatial accuracy, more information of terrain/ground ice/temperature/permafrost relationships, more temperature boreholes, and improved spatial models.

Closure Plan
CMS Palmer Monofill

The purpose of this closure plan is to describe the methods and procedures that will be used during the closure of the CMS Palmer Monofill following its use.

Final Cover and Appearance

Following the closure of the site, the site will be characterized by a gently sloping (1%–2% grade) plateau as shown on Sheet 4 of the plan set. All surfaces will be seeded and covered with grass after germination.

Methods and Procedures

Following completion and filling of all cells within the monofill, native soil from the surrounding area will be brought to the area and used to create the two foot thick cap overtop the monofill. The cap will be compacted and brought to final grade using heavy equipment, such as, bulldozers. The soil berm designed to protect and stabilize the tire berm will be constructed throughout the operation of the monofill by adding additional soils as the height of the tire berm increases. A 4 inch topsoil layer may also be placed overtop the entire monofill if the soil cannot support grass growth; the topsoil will also consist of local material from surrounding areas. With the cap and topsoil in place, the area will be seeded with a seed mixture selected at that time.

Timeline and Schedule

It is anticipated that the final waste will be placed in 2040 and all reclamation operation will be completed by the end of 2041.

Future Property Use

Following the closure of the monofill the property will most likely become recreational use land such as sports fields and/or parks.

Survey Markers and Monuments

At the time of closure, two survey monuments will be placed on eastern corners of the Cell E, the asbestos cell, in the landfill. Additionally, the corners and all other appropriate features of site will be surveyed to document the location of all wastes. All ACM locations will also be recorded. Drawings showing the boundaries of the RACM waste management area must be filed with the department and attached to the property deed, with a written warning about health and safety hazards related to disturbing the site. The limits of the asbestos disposal area will be marked on property survey records, and recorded on the property deed as part of closure of the monofill.

ADEC Notification of Completed Closure Requirements

A more detailed closure plan will be submitted to ADEC for review and approval within 30 days of the placement of the last inert waste in the landfill. The final closure activities will

Permit: *Alaska DEC, Solid Waste Program*
Applicant: *Central Monofill Services, Inc.*
Date Submitted: *January 8, 2013*

begin in accordance with the schedule in the closure plan. Once the monofill has been closed and all areas of the monofill have been stabilized a report will be submitted to the ADEC which will address all applicable closure requirements. The monofill will be monitored monthly for 60 months (5 years) after the final cap is installed.

RE: CMS Palmer Monofill

Subj: Reclamation Quote

This quote is in reference to the final reclamation of the proposed Central Monofill Services Inert Debris Monofill located at Milepost 35.3 Glen Highway. This proposal includes labor, supplies and equipment to cover the 40 acre site with 4 inches of topsoil, properly seed the disturbed 40 acres, and then monitor the site for 60 months.

Item	Quantity	Cost Per Unit	Total Cost
Closure of Monofill			
Topsoil w Labor	167,000 SY	$ 1.00	$ 83,500.00
Seeding w Labor	40 Acres	$ 500.00	$ 20,000.00
Subtotal			$103,500.00
Construction Contingency (15%)			$ 15,525.00
Reclamation Subtotal			$ 119,025.00
Post Closure Care of the Facility (Visual inspections, ½ day for 60 months)			
Monitoring Labor	30 Days	$ 350.00	$ 10,500.00
Equipment Cost	30 Days	$ 55.00	$ 1,650.00
Post Closure Care Subtotal			$ 12,150.00
Total			**$ 131,175.00**

With annual revenue of over $3.5 million per year, CRS has the financial resources to complete the closure of this site. Appropriate bonding or other documents can be provided on request.

Sincerely,
ENVIRONMENTAL MANAGEMENT, INC.

Tire Bale Wall Structural Calculations

Concepts

The following conditions have been evaluated for the Tire Bale Wall Structural Calculations:

- Sliding Failure – See Attachment A
- Overturning Moment Failure – See Attachment B
- Deep Seated Failure – See Below
- Excessive Settlement – See Below
- Bearing Capacity Failure – See below

Methods and Procedures

Some of the calculations above rely on bearing capacity and typical soil coefficients that are readily available from soil resources to be completed. Due to the nature of the C&D debris (typical gradations, types of materials, variability of material per sample) that will be used as lightweight backfill material behind the wall, and in some areas, the bedding material for the walls, a different methodology must be used to obtain the pertinent data.

Laboratory tests will not represent the material as it will be found in the monofill nor are there tests setups to establish the values needed for the calculations. Alaska Test Labs (DOWL) was consulted about this issue and they helped EMI establish a methodology to calculate the bearing capacity and in place density of the materials in the field, in the compacted and in-situ condition that will represent the real world conditions we face.

ASTM D 1194-94 Standard Test Method for Bearing Capacity of Soil for Static Load and Spread Footings (See Attachment C) will be setup in the field after a cell has been filled, compacted and allowed to settle for a small period of time. With this test method, a field condition test will allow EMI to establish a true bearing capacity for the inert waste. An in place density test such as the Sand Cone Method will be used to establish a field density. With this information, final calculations will be given to DEC for review and approval. If the test results prove the material will not work as previously planned, a meeting will be setup between CMS and DEC to discuss site plan changes.

Deep Seated Failure – Due to the general shape of the retaining structure and the existing ground slope it will be seated against (See Detail 5 of Sheet 3), the existing ground will resist forces caused by deep-seated shear failure. The existing soil has a density ranging from 100 lb/ft^3 to 135 lb/ft^3 as compared to the Inert waste at around 45 lb/ft^3. Also, traditional bearing wall calculations are setup with vertical retaining wall resisting soil forces. The shape and orientation of the wall and gentle 2:1 slope provides an even greater factor of safety against deep seated failure.

Excessive Settlement – The values needed to calculate settlement are not known at this time. EMI will setup benchmarks onsite and record data over time to keep track of this for

future use. The retaining wall and monofill are designed such that any settlement and/or wall failures that could occur would only impact onsite volumes and shapes. There are no area's where a settlement could cause adverse effects to neighboring lands or cause safety issues for workers onsite. Also, the nature of the tire bales being built with existing soils as a leveling material, allow for settlement to occur without adverse consequences.

Bearing Capacity Failure – Calculations will be submitted after a Bearing capacity for the material is established as described above.

Timeline and Schedule

See the operations plan for more details on cell construction and schedule. Tire Bale's will not be used for retaining walls for at least one or two years into the operating life due to their relative elevation and location in the monofill. This delay in use will allow time to sample and test the material, complete calculations, and obtain approval from DEC for use.

1. Sand Density found on Page 9, Principals of Foundation Engineering 5th Edition, Braja M Das
2. Inert Waste Density comes from empirical data provided by Central Recycling Services
3.Tire Bale Density comes from Table 3.1, Report No. CDOT-DTD-R-2005-2 Tire Bales in Highway Applications: Feasibility and Properties Evaluation, Zornberg, Christopher and Oosterbaan

Attachment C

Designation: D 1194 – 94

Standard Test Method for Bearing Capacity of Soil for Static Load and Spread Footings[1]

This standard is issued under the fixed designation D 1194; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ε) indicates an editorial change since the last revision or reapproval.

This standard has been approved for use by agencies of the Department of Defense.

1. Scope

1.1 This test method covers estimation of the bearing capacity of soil in place by means of field loading tests. This test method can be used as part of a procedure for soil investigation for foundation design. It gives information on the soil only to a depth equal to about two diameters of the bearing plate, and takes into account only part of the effect of time.

1.2 The values stated in inch-pound units are to be regarded as the standard. The SI units given in parentheses are for information only.

1.3 *This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.*

2. Significance and Use

2.1 This test method is used to estimate the bearing capacity of a soil under field loading conditions for a specific loading plate and depth of embedment. The bearing capacity of a soil is not simply a soil strength parameter, but it also depends on the magnitude and distribution of the load, dimension, and geometry of the loading plate and depth of embedment (or elevation of testing). This bearing capacity can be used in soil investigations and for the design of foundations.

3. Apparatus

3.1 *Loading Platforms or Bins* of sufficient size and strength to supply the estimated total load required or equivalent means of supplying the total load reaction anticipated.

3.2 *Hydraulic or Mechanical Jack Assembly* of sufficient capacity to provide and maintain the maximum estimated load for the specific soil conditions involved, but not less than 50 tons (440 kN) in any case, and at least one device, such as a pressure gage, electronic load cell, or proving ring, for measuring the force exerted by the jack. The force-measuring devices should be capable of recording the load with an error not exceeding ±2 % of the load increment used.

3.3 *Bearing Plates*—Three circular steel bearing plates, not less than 1 in. (25 mm) in thickness and varying in diameter from 12 to 30 in. (305 to 762 mm), including the minimum and maximum diameter specified or square steel bearing plates of equivalent area. As an alternative, three small concrete footings of the size mentioned or larger can be cast *in-situ*. Such footings must have a depth of not less than two thirds of their width.

3.4 *Settlement-Recording Devices*, such as dial gages, capable of measuring settlement of the test plates to an accuracy of at least 0.01 in. (0.25 mm).

3.5 *Miscellaneous Apparatus*, including loading columns, steel shims, and other construction tools and equipment required for preparation of the test pits and loading apparatus.

NOTE 1—Testing assemblies may vary widely, depending on job conditions, testing requirements, and equipment available. The testing assembly and program should be planned in advance and approved by the supervising engineer, and in general can permit considerable latitude in details within the specific requirements noted above and outlined in the following test procedure. A typical assembly for conducting load tests is illustrated in Fig. 1.

4. Procedure

4.1 *Selection of Test Areas*—Base the selection of representative test areas for bearing tests on the results of exploratory borings and on the design requirements of the structure. Unless otherwise specified, make the load test at the elevation of the proposed footings and under the same conditions to which the proposed footings will be subjected. At the selected elevation place the bearing plates at the same relative depths (depths expressed in plate diameters) as the actual footing.

NOTE 2—For footings placed under permanently excavated basements the depth of the actual footing is construed as the depth from the basement level or depth over which the surcharge is permanently acting, rather than the depth from the ground surface.

NOTE 3—If the mentioned condition of equal relative depth cannot be met for practical reasons, the test results must be interpreted by using an

[1] This test method is under the jurisdiction of ASTM Committee D18 on Soil and Rock and is the direct responsibility of Subcommittee D18.08 on Special and Construction Control Tests.

Current edition approved March 15, 1994. Published May 1994. Originally published as D 1194 – 52 T. Last previous edition D 1194 – 72 (1987)ε[1].

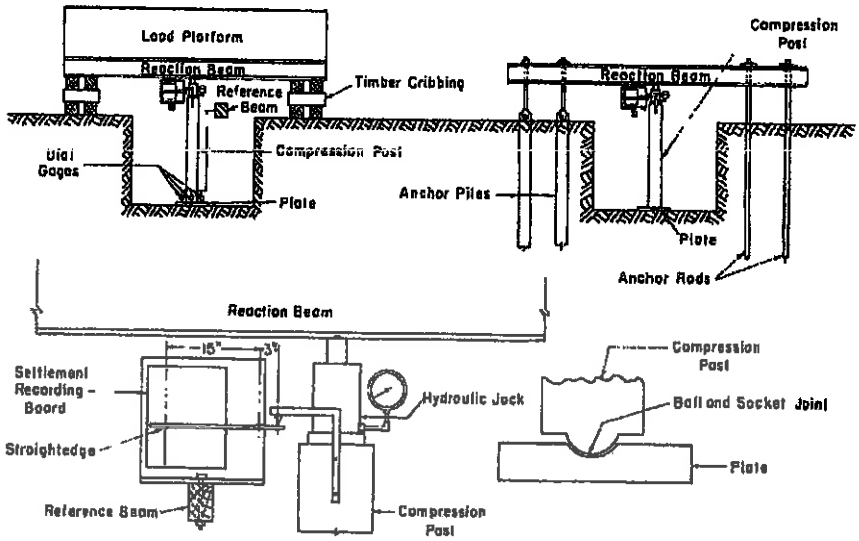

FIG. 1 Typical Setup for Conducting Static Load Tests

appropriate theory of bearing capacity. Also make corrections for the effects of the shape and size of the footing and the effects of the water table as appropriate.

4.2 *Test Pits*—At least three test locations are required, and the distance between test locations shall not be less than five times the diameter of the largest plate used in the tests. Carefully level and clean the areas to be loaded by the test plates or footings so that the loads are transmitted over the entire contact areas on undisturbed soil. Prior to loading, protect test pits and areas against moisture changes in the soil unless it is expected that wetting of the soil will occur at some future time, as in the case of hydraulic structures. In this case, prewet the soil in the area to the desired extent to a depth not less than twice the diameter of the largest bearing plate.

4.3 *Loading Platforms*—Support the loading platforms or bins by cribbing or other suitable means, at points as far removed from the test area as practicable, and preferably not less than 8 ft (2.4 m). The total load required for the test shall be available at the site before the test is started.

4.4 *Dead Load*—Weigh and record as dead weight all equipment used, such as steel plates, loading column and jack, etc., that are to be placed on the test area prior to the application of the load increments.

4.5 *Reference Beam*—Independently support the beam supporting dial gages or other settlement-recording devices as far as practicable, but not less than 8 ft (2.4 m) from the center of the loaded area.

4.6 *Load Increments*—Apply the load to the soil in cumulative equal increments of not more than 1.0 ton/ft^2 (95 kPa), or of not more than one tenth of the estimated bearing capacity of the area being tested. Accurately measure each load, and apply it in such a manner that all of the load reaches the soil as a static load, without impact, fluctuation, or eccentricity.

4.7 *Time Interval of Loading*—After the application of each load increment, maintain the cumulative load for a selected time interval of not less than 15 min.

NOTE 4—Longer time intervals may be determined by maintaining the load until the settlement has ceased or the rate of settlement becomes uniform. However, maintain any type of time interval so selected for each load increment in all tests of any series.

4.8 *Measurement of Settlement*—Keep a continuous record of all settlements. Make settlement measurements as soon as possible before and after the application of each load increment, and at such equal time intervals, while the load is being held constant, as will provide not less than six settlement measurements between load applications.

4.9 *Termination of Tests*—Continue each test until a peak load is reached or until the ratio of load increment to settlement increment reaches a minimum, steady magnitude. If sufficient load is available, continue the test until the total settlement reaches at least 10 % of the plate diameter, unless a well-defined failure load is observed. After completion of observations for the last load increment, release this applied load in three approximately equal decrements. Continue recording rebound deflections until the deformation ceases or for a period not smaller than the time interval of loading.

NOTE 5—The following alternative loading procedure is also permissible: Apply the load to the soil in increments corresponding to settlement increments of approximately 0.5 % of the plate diameter. After the application of each settlement increment, measure the load at some fixed time intervals, for example, 30 s, 1 min, 2 min, 4 min, 8 min, and 15 min, after load application, until the variation of the load ceases or until the rate of variation of the load, on a load *versus* logarithm-of-time scale becomes linear. Continue loading in selected settlement increments. Termination of tests and unloading are made in the same manner as in 4.9.

5. Report

5.1 In addition to the continuous listing of all time, load, and settlement data for each test, as prescribed in Section 3, report all associated conditions and observations pertaining to the test, including the following:

5.1.1 Date,

5.1.2 List of personnel,

5.1.3 Weather conditions,

5.1.4 Air temperature at time of load increments, and

5.1.5 Irregularity in routine procedure.

6. Precision and Bias

6.1 The precision and bias of this test method for determining the bearing capacity of soil in place by means of a field loading test has not been determined. No available methods provide absolute values for the bearing capacity of soil in place against which this method can be compared. The variability of the soil and the resulting disturbance of the soil under the loading plate do not allow for the repetitive duplication of test results required to obtain a meaningful statistical evaluation. The subcommittee is seeking pertinent data from users of this method which may be used to develop meaningful statements of precision and bias.

7. Keywords

7.1 bearing capacity; bearing plate; deflection; settlement

ASTM International takes no position respecting the validity of any patent rights asserted in connection with any item mentioned in this standard. Users of this standard are expressly advised that determination of the validity of any such patent rights, and the risk of infringement of such rights, are entirely their own responsibility.

This standard is subject to revision at any time by the responsible technical committee and must be reviewed every five years and if not revised, either reapproved or withdrawn. Your comments are invited either for revision of this standard or for additional standards and should be addressed to ASTM International Headquarters. Your comments will receive careful consideration at a meeting of the responsible technical committee, which you may attend. If you feel that your comments have not received a fair hearing you should make your views known to the ASTM Committee on Standards, at the address shown below.

This guidance document is intended to give building owners, inspectors, and contractors information on how to best handle the materials and wastes resulting from the construction, demolition, and renovation of buildings. Federal regulations require the removal of all asbestos-containing materials and all hazardous or toxic materials before demolition or renovation of a building begins. Contractors will provide a safer environment for their workers and the public by giving proper attention to the wastes generated by a project before demolition or renovation begins.

Topics Covered

- The First Step: The Building Survey
- What if a Building Has Asbestos?
- What about Hazardous Waste?
- What if I Want to Burn the Woody Debris?
- How Do I Dispose of Non-Hazardous Waste?
- What Wastes Can be Disposed Without an ADEC Solid Waste Permit?
- Contact Information

The First Step: The Building Survey

As mentioned above, the federal regulations require the removal of all asbestos-containing materials and hazardous or toxic materials prior to beginning a building demolition or renovation. Identifying the location and approximate amounts of these materials is most readily accomplished by completing a building survey. Once each waste type is identified and located, it can then be removed from the building according to appropriate state and federal regulations and best management practices and recycled or disposed in the most appropriate manner. A building survey does not need to be complicated and there are different methods for doing a survey. You should develop a method that best fits your needs.

Handling & Disposal of Construction & Demolition Waste

April 2014

Solid Waste Program

Removal of asbestos and hazardous wastes **after** demolition is difficult and expensive. By knowing the types and quantities of all wastes that will be generated, you can plan ahead and figure out how to recycle or dispose of those wastes in the most efficient and safest manner. Even though it may be difficult to correctly identify all the material, a thorough investigation can save you many headaches later.

Once you have surveyed your project and know all the types and amounts of materials that will be generated, you can determine which materials can be recycled, burned, or disposed. The most common methods for disposing of different wastes will be discussed in this document. Please contact your local landfill, recycling facility, or sponsoring organization for recycling information. Some common recyclable wastes include piping, conduit, fixtures, timbers, windows, and doors.

Federal law requires that you contact EPA before demolition begins, regardless of the type of waste involved. Contact them after you have identified the types of wastes the project will generate.

What if a Building Has Asbestos?

Regulated Asbestos-Containing Material (RACM) must be removed prior to the demolition of a building and must be disposed at a landfill permitted to accept RACM wastes.

RACM waste is any asbestos-containing material that contains more than 1% asbestos, and that when dry, can be crumbled or reduced to powder by something as minor as hand pressure. If it can be crumbled or reduced to powder relatively easily, it is called "friable".

Non-RACM waste, on the other hand, is asbestos-containing material that is not friable or is not likely to become friable during the demolition or renovation activities. In other words, it is material that when dry cannot be crumbled, pulverized, or reduced to powder by hand pressure or by the demolition or renovation process. Non-RACM waste can be disposed at a permitted construction and demolition waste landfill or at a permitted municipal solid waste landfill provided the operator is willing to accept the waste.

For projects in rural areas without a nearby permitted landfill, the project may qualify for an authorization for the one-time disposal of asbestos waste. Such authorizations are described in greater detail in the section "How Do I Dispose of Demolition Waste?" ADEC Solid Waste Program staff can help you determine if this is an option for your project.

You will typically find asbestos-containing material in anything that was intended to retard fires. Specifically look at door gaskets, duct insulation, and the tape at duct connections of furnaces, boiler, and wood stoves. Hot water pipes inside walls and the tees, valves, elbow, and cross connections should also be checked. Wall board; mastic, acoustical tile or sprayed-on ceilings; roof felt and shingles; window putty; cement asbestos board siding and undersheeting; electrical equipment such as

lamp sockets, outlet and switch boxes, recessed lighting units, and old-fashioned wiring insulation, and older electrical appliances may be additional sources for asbestos-containing material.
It is important in older facilities such as HUD housing, FAA buildings, and military facilities to survey the flooring. Many floors had 1½ to 3 inches of material stacked on top of one another. Asbestos-containing material may be in some or all of the layers.

Asbestos waste may not be burned because it does not burn but just becomes airborne. Therefore, it is important to remove all asbestos-containing materials if your intention is to burn debris after a building is demolished. Note that if non-RACM waste catches fire, it becomes regulated by EPA under the National Emission Standards for Hazardous Air Pollutants (NESHAP) program.

Once you have identified and located any RACM waste, you must arrange for a certified contractor to remove it. The contractor will package and ship it to a landfill that is permitted for RACM waste. The Department of Labor's Occupational Safety and Health Section certifies asbestos abatement workers and maintains a list of certified workers. You can contact them at 907-269-4940 or 907-451-2888.

Remember to notify EPA before any asbestos removal or building demolition begins. The EPA requires notification ten working days in advance so they have an opportunity to inspect the job. They can provide greater detail as to what is or is not considered RACM waste. The regulations can be complex, and EPA welcomes the opportunity to provide clarification and assistance. You can contact EPA at the Alaska office at 907-271-3688 or 800-781-0983, or the Seattle office at 206-553-4226.

What about Hazardous Waste?

Federal regulations define what materials are considered hazardous waste and how these materials must be disposed. Contact EPA at 907-271-6329 or 800-781-0983 for more information.

Hazardous wastes commonly found in a demolition project include:

- Some lead painted materials;
- Some fluorescent tubes and spent incandescent bulbs;
- Lead pipe and solder
- Mercury switches;
- Lead based paint;
- Some liquid paint wastes;
- Unused solvent based paints;
- PCB containing transformers (classified as toxic);
- PCB containing light ballasts (classified as toxic).

Federal and State occupational safety and health regulations may apply if your project involves hazardous materials, such as asbestos- or lead-containing products, and your workers may need to be certified or specifically trained. Please contact Alaska Occupational Safety and Health for more information.

If you are demolishing a building which has an air conditioning system, you must recover the refrigerant, something that may only be done by a certified technician. Simply venting the refrigerant into the air is prohibited.

Burning hazardous wastes or any materials that may emit a toxic gas when burned is prohibited. This includes such things as certain chemicals, tars, linoleum, plastic, foam insulation, rubber, toxic waste, lead pipes, and PVC plastic piping.

When determining the amount of hazardous waste that will be generated, you must include all the hazardous products used for removing building materials.

State law generally prohibits the disposal of hazardous waste in the state. However, small quantity generators of hazardous waste (those that generate less than 220 pounds per month per site) can dispose of their hazardous wastes at a permitted Class I or II landfill. If you are registered with the EPA as a small quantity generator, contact your local landfill to find out if it is a Class I or II landfill with a current permit and is will to accept "conditionally exempt small quantity generator" waste.

If the local landfill does not have a Class I or II permit, you may be able to transport the waste to another Class I or II landfill for disposal, if that landfill accepts hazardous waste from outside its municipal boundary. Contact the landfill and/or ADEC Solid Waste Program for more information.

If your demolition project produces more than 220 pounds of hazardous waste in a month, you will need to ship this waste out of state to an EPA-registered treatment, storage, and disposal facility.

What if I Want to Burn the Woody Debris?

Controlled burning of clean, woody debris from construction, demolition, or land clearing projects is allowed in most areas of Alaska, but it needs to be conducted in a manner that doesn't create a nuisance or become a health hazard to local residents. "Clean woody debris" means wood that has not been treated with a paint containing cadmium or lead, or with a weatherizing preservative (such as pentachlorophenol or creosote).

It is important to note that burning is <u>not</u> considered to be complete disposal for construction and demolition waste because the ash and unburned debris must be disposed at a permitted landfill. You may also be required to test the ash and debris in order to verify that it is non-hazardous (see previous section for hazardous waste management).

Solid Waste Program

Ash from the burning of land clearing waste is not a solid waste and is therefore not required to go to a landfill. However, if you are burning greater than 40 acres of land clearing debris, or if black smoke will be produced, you will need a permit from ADEC's Air Quality Program. Some areas in Alaska require coordination with and permits from the local authorities. For instance, if your project is located in Fairbanks, Anchorage, Ketchikan, Homer, or Juneau, you need to contact local government authorities for approval. In some areas, the Alaska Department of Natural Resources, Division of Forestry may also require a burn permit. It is always wise to contact the local fire department to let them know you will be burning in the area.

To learn more about burning woody debris in your project area, please contact the ADEC Air Quality Program at: Interior 907-451-2114 or South Central and Southeast 907-269-6847. Or visit their website at http://www.dec.state.ak.us/air/ob.htm.

How Do I Dispose of Non-Hazardous Waste?

If the waste you generate is not an EPA-regulated hazardous waste and is not exempt from state permit requirements (see next section), you must dispose of it at a permitted solid waste landfill. This may be an existing facility or a landfill specifically permitted for your project. A solid waste permit ensures that waste is disposed at a suitable location and in a way that will minimize the likelihood of pollution or associated health problems. If you plan to take waste to a permitted facility, you should contact them directly. If you want to permit a project-specific landfill, contact the nearest ADEC Solid Waste Program office regarding whether you will need an inert waste landfill permit or an asbestos landfill permit. Program staff will discuss your situation with you and help you determine which option is best for the project. The permit application review and public notice process will begin after a completed application and the required fee is received.

Another option that may apply to your project is obtaining an authorization for a one-time disposal of either inert or asbestos waste. These authorizations come with strict limitations on the amount of waste allowed in the one-time disposal so not all projects will qualify for these. ADEC provides two types of one-time authorizations for remote construction and demolition projects:

- **Authorization for one-time disposal of asbestos-containing waste.** This authorization allows the disposal of up to 250 cubic yards of RACM and non-RACM waste that is generated on the project site. This authorization pertains only to projects in locations that do not have year-round ground access to a system of connected roads with a total length of 100 miles or more; or where all permitted landfills are more than 100 road miles away or have refused, in writing, to accept the waste. If your situation does not fit these conditions, you will need to apply for an asbestos waste monofill permit. You should also contact EPA to determine if any federal regulations will apply to the project.

Handling & Disposal of Construction & Demolition Waste

April 2014

Solid Waste Program

- **Authorization for one-time disposal of inert waste.** This authorization allows the one-time disposal of up to 1,000 cubic yards of building debris and other inert wastes, but does not include asbestos waste or non-salvageable scrap metal debris. This authorization may only be used for disposal of wastes in locations that do not have year-round ground access to a system of connected roads with a total length of 100 miles or more or; where all permitted landfills are more than 100 road miles away or have refused in writing, to accept the waste. If your situation does not fit these conditions, you will need to apply for an inert waste monofill permit.

What Wastes Can Be Disposed Without an ADEC Solid Waste Permit?

Most building construction and demolition debris is considered "low risk," which means that it has little or no potential to cause pollution problems. Some wastes such as concrete, brick, and mortar are considered "very low risk" and are usually not regulated. This "exempt" waste does not need to go to a permitted landfill, as long as it is not mixed with other wastes. Examples of exempt wastes that you might encounter during demolition, renovation, or construction projects include:

- Land clearing waste, including excavated dirt, rock soil, butt ends, limbs, stumps, or other foliage;
- Portland cement type concrete and associated steel rebar that can't be easily removed;
- Crushed glass except for television tubes, fluorescent light tubes, or computer monitors;
- Crushed asphalt pavement used in:
    - A building pad or parking area as road base or pavement; or
    - As a material to construct a containment berm for a tank farm

Contact the ADEC Solid Waste Program for more about different disposal options and exempt waste.

Asbestos is a material that has been used in a wide variety of building materials and friction products. Asbestos is inert and non-hazardous if it remains undisturbed. However, if the material is disturbed and the fibers become airborne, they can cause serious lung and health problems. To protect workers and residents, **all demolition and renovation projects should be inspected for asbestos and any asbestos properly removed prior to doing any other work.**

It is impossible to definitively identify asbestos by sight. If a building was constructed prior to 1980, it is likely to contain asbestos in a variety of construction products. After 1980, some asbestos products, including some wall board, flooring materials, roofing materials, mastics, thermal, and cement products, continued to be used in construction materials. For any demolition or renovation, a professional should survey the project and samples must be taken of suspect materials. A laboratory examination of the material using specialized microscopes is necessary to determine if asbestos fibers are present within the material.

Types of Asbestos-Containing Materials
Material that contains 1% or more asbestos fibers is, by definition, Asbestos-Containing Material (ACM). Material that contains less than 1% asbestos is not regulated as ACM.

Friable: Used to describe ACM that, when dry, can be crumbled, pulverized, or reduced to powder by hand pressure.

ACM is further divided into categories:

- *Regulated Asbestos-Containing Material* (**RACM**) includes any ACM that is friable, or is likely to become friable due to the methods used for demolition, renovation, or disposal. Both handling and disposal of this material is stringently regulated as it carries the most risk to the health of residents and workers.

- *Non-Regulated Asbestos-Containing Material* (**non-RACM**) refers to ACM that is non-friable. These materials are segregated into Category I and Category II ACM. The handling and disposal of both Category I and Category II ACM is still regulated, but removal and disposal have less stringent requirements if the material is handled carefully to prevent damage that could release asbestos fibers. Non-RACM becomes RACM and must be managed as such if it is damaged so that asbestos fibers may be released.

Asbestos Handling & Disposal

July 2014

Solid Waste Program

dec.alaska.gov/eh/sw

Removal of RACM and Non-RACM

The removal and transport of ACM is regulated by the Environmental Protection Agency (EPA) and Alaska Occupational Safety and Health Administration (AKOSH). At least 10 days prior to removal of ACM you must contact the EPA and AKOSH to report most demolitions or remodels, regardless of the presence of ACM. Questions regarding the regulations and requirements applicable to a specific project should be addressed to the Anchorage office of the EPA at (907) 271-3688, or to AKOSH at (907) 269-4955.

Due to the potential health risks, the removal and disposal of ACM requires special equipment and detailed training. ACM must be removed properly to prevent damage that would cause it to release fibers to the air. For non-RACM, sanding, grinding, crushing, or other processes that could result in release of fibers must be avoided.

8 AAC 61.600. Certification required
A person performing, directly supervising, or monitoring asbestos abatement work must have a certificate issued under 8 AAC 61.720. The certificate must be in the person's possession when performing work

State regulations require that removal of ACM must be conducted ONLY by certified asbestos abatement professionals. Contact the Alaska Department of Labor, AKOSH Section at (907) 269-4955 for more information about certified contractors and asbestos abatement training.

Disposal of RACM Waste

Disposal of ACM is regulated by the Alaska Department of Environmental Conservation (ADEC). RACM waste may only be disposed in a landfill permitted to accept this waste. However, each landfill determines its own acceptance policy for these materials. The landfill operator may impose restrictions such as special packaging requirements or limited hours for delivery of RACM, or may choose not to accept the waste. Some cities or boroughs will not accept RACM waste generated outside their boundaries. You will need to contact the landfill to determine what specific policies for RACM waste disposal apply.

All RACM, including any non-RACM that has been damaged by sanding, grinding, crushing, or other processes that could result in release of fibers, must be handled and disposed according to regulations. It must be packaged in leak-tight containers or bags, and properly labeled. A waste shipment record must be filled out for each load and signed by both the transporter and the landfill operator.

The landfill operator is required to inspect each load to verify that the RACM waste is properly packaged and labeled and that shipping records match the quantities delivered. Any discrepancies in the records must be reported to the EPA. The landfill operator must also supervise the disposal of each container and must cover the RACM bags or containers with six inches of soil or other material that does not contain ACM by the end of the working day. The landfill operator is also required to keep detailed records of the quantities, and disposal locations and depths of all RACM disposed in the landfill.

Asbestos Handling & Disposal

July 2014

Solid Waste Program

dec.alaska.gov/eh/sw

Disposal of Non-RACM Waste

Non-RACM waste that has not been damaged may be disposed in most permitted Class I and Class II municipal solid waste landfills, inert waste monofills, or asbestos monofills. However, each landfill determines their own acceptance policy for these materials and not all of them will accept non-RACM waste. You will need to contact the landfill prior to delivering non-RACM waste for disposal to confirm that it will be accepted.

Once deposited at the landfill, non-RACM requires special handling to ensure that it does not become friable. The material may not be compacted or driven over by landfill equipment until it is covered by at least six inches of material that is not ACM. For this reason, many landfills choose to dispose of non-RACM waste in separate areas from other waste.

Landfills are not required to track waste shipment records or disposal areas for non-RACM waste.

Summary of Handling Requirements

RACM Requirements	
Generators Must:	**Landfills Must:**
• Notify AKOSH & EPA, as required • Ensure removal is performed by certified asbestos abatement professionals only • Use proper removal and safety techniques as prescribed by AKOSH • Seal in leak-proof containers • Apply all required warning labels • Determine landfill RACM acceptance policy • Fill out all required shipping records • Deliver to a landfill permitted for asbestos disposal • Maintain all required records	• Inspect each load to verify that RACM waste is properly contained and labeled • Ensure that shipping records match the amounts delivered, and report any discrepancies to EPA • Cover all RACM waste with six inches of soil or non-RACM by the end of the working day • Track quantities, depths, and location of all RACM waste

Asbestos Handling & Disposal

July 2014

Solid Waste Program

dec.alaska.gov/eh/sw

Non-RACM Requirements:

Generators Must:

- Notify AKOSH & EPA, as required
- Ensure removal is performed by certified asbestos abatement professionals only
- Use proper removal and safety techniques as prescribed by AKOSH, and ensure that the material is not broken, crushed, sanded, ground, or otherwise damaged so that fibers may be released
- Determine landfill non-RACM acceptance policy
- Deliver to permitted landfill that accepts non-RACM

Landfills Must:

- Ensure that material does not appear to have been handled in a manner that could release fibers, creating RACM
- Handle carefully to prevent damage
- Ensure that non-RACM is not compacted or otherwise damaged prior to covering

Subject: Proposed monofill

December 6th, 2014

Dear Planning commission members,

You have been urged by the applicant to not listen to any of the community's opinions because they are base on emotions and not fact. I would urge you to consider the very most important things in life are often emotionally based.

When a man has a gun held to his head, do you think he is thinking or he is feeling? We as humans have strong emotions when our lives are threatened, or when our family or tribe is threatened. I would venture to say the all of our wars are actions started by an emotional response. We do respond emotionally to a threat, that does not mean we are not thinking as well. I am responding to this threat to the women and men of our community, but especially the children, they that cannot speak for themselves yet must bear all the consequences of our actions and decisions.

No one has yet answered the question, what if something goes wrong? The MSB has stated that and I quote "It is possible that nothing will go wrong"..."the water table is a moving target." "It is with reservation we approve this permit." That was the most ambiguous and confusing statement.

I am a nurse and have been witness to doctors consenting people for surgery. Do you think a doctor would tell a patient, "it is possible nothing will go wrong, and I recommend this surgery ***with*** reservations as your blood flow is a moving target and we just might get it wrong, but here go ahead and sign this consent."

Would not you as a patient want to know more, to have more assurances than just "Well we hope this works out and even though it is not a necessary surgery, you could die."

This is what the applicant is asking us as the community to do. The applicant stands to reap all the benefits from a decision for the dump, while we the home owners and families stand to reap years of anxiety and pollution and ill health that goes along with that decision. I ask you, is it fair that one person's claim should outweigh a community of people?

I would also ask you all to hold yourselves to the upmost ethical standards and think of the good of entire community, not just a few. It was very disturbing to see one of the commissioners protect the other commissioner who was reluctant to recuse himself though he admittedly did business with the applicant. It reeks of GOBSAT..."good old boys sitting around a table" deciding things regardless of the community desires or needs. I am fervently hoping you are men of honor and integrity.

I am sure all of your are interested in the long term well-being of our beautiful Palmer. What effects one community effects all the communities of this Valley. I will be earnestly praying for you.

Sincerely,
Rose Williams RN, CNM

HANDOUT

Mary Brodigan
Planning Commission Clerk
Planning & Land Use Department
Matanuska Susitna Borough

Re: Resolution 14-33, CUP for an Inert Material Monofil-response to Commissioner Adams' question

Dear Ms. Brodigan:

This letter is in response to Commissioner Adams's December 5, 2014 e-mail regarding the status of the enforcement action against CMS. There is no current enforcement action against CMS. In May, 2013, an enforcement order and subsequent citations were issued against CMS concerning materials CMS brought to its Palmer property. CMS timely appealed the enforcement order to the BOAA. CMS also contested the citations, arguing that the materials were not "trash" as defined in the borough code and that it was not operating a "junk yard," as defined in the borough code. The district court ruled against CMS on the violations and CMS was fined a total of $225, which fine has been paid. (Shane Durand was also cited for the same infractions and he was fined the same amount.)

Subsequent to that decision, the BOAA appeal was heard. The BOAA found that the materials were not "trash" as defined in the borough code and that CMS was not operating a "junk yard." It did, however, find that, for CMS to continue operation on the site, a conditional

use permit was required because the property was "being commercially used for the purpose of recycling or repurposing materials." Although the BOAA decision did not specifically require CMS to remove the existing topper material it had taken to the location, CMS did remove all of that material. CMS is currently in compliance with the borough code.

Very truly yours,

William H. Ingaldson

HANDOUT

Re: CMS's Application for a CUP

Dear Ms. Brodigan:

As introduced at the December 1, 2014 planning commission hearing, I am an attorney who has been retained on behalf of CMS. This letter is in response to Lonnie McKechnie's December 3, 2014 letter regarding the recusal action taken at the December 1, 2014 hearing. While we appreciate Ms. McKechnie's efforts to correct the incorrect advice she offered at that hearing, the advice in her December 3, 2014 letter is still incorrect.

Section 4.05.080(A) of the Matanuska Susitna Borough Code provides that "all meetings shall be conducted in accordance with the current edition of *Robert's Rules of Order Newly Revised*." We agree with Ms. McKechnie that the motion at issue was improperly phrased. However, because the motion was improper, it does not have to be recinded, it should simply be declared null and void by the chair. In addition, Ms. McKechnie's advice as to the number of votes required to carry the motion and as to whether Commissioner Kendig could participate in the vote, was also incorrect.

The Recusal of Commissioner Kendig Was Improper and Therefore Is Null and Void.

Ms. McKechnie is correct in that the form of the motion should have been a motion to disallow Commissioner Kendig from participation in this matter. In order to carry such a motion, it requires a vote of two thirds of the votes cast. RONR (11th Ed.), p. 401, ll. 26-27, p. 648, ll. 1-2. At the December 1, 2014 hearing there was only one vote against allowing Commissioner Kendig to participate, out of four votes cast.

Separately, Commissioner Kendig was improperly prohibited from voting on the motion. *Robert's Rules of Order* allows a member to vote on a question affecting himself. RONR (11th Ed.), pp. 407, l. 30-p. 408, l. 7. As pointed out in *Robert's Rules of Order*, if members were not allowed to vote on such questions, a minority of members could override the will of a majority of members simply by bringing a motion to expel or suspend the majority members. If the majority members were not allowed to vote on that motion, because they were the subject of it, the will of the minority would prevail.

Because (a) the question was improperly posed, (b) there were insufficient votes to remove Commissioner Kendig (less than two-thirds of the votes cast) and, (c) Commissioner Kendig was not allowed to vote, the motion was improper and was out of order. As such, it is null and void. RONR (11th Ed.), p. 343, ll. 14-17. Thus, a point of order should be raised and the chair should declare the motion null and void. It is not necessary to rescind a null and void motion.

Number of Votes Required to Rescind a Motion

If the motion was not improper, and therefor null and void, it may be rescinded by motion. A motion to rescind a previously adopted motion requires: (a) a vote of two-thirds of the votes being cast (members who abstain or are absent are not counted) – RONR (11th Ed.), p. 401, ll. 8-17; (b) a majority of the votes cast when notice of the intent to make the motion to rescind was given at the previous meeting, before the present meeting or in the call of the present meeting (since the December 15, 2014 meeting is a continuance of the December 1, 2014 meeting, it should be considered the same meeting and no advance notice is required) or (c) a vote of the majority of the entire membership. RONR (11th Ed.), p. 306, ll. 24-31. Ms. McKechnie is incorrect when she states that a motion to rescind would require five votes if previous notice is not provided. That would never be the case. If prior notice was not provided, a motion to rescind would require either a vote of four commissioners (which is a majority of the entire membership) or two-thirds of the voting members. Thus, if four commissioners voted on the motion to rescind, it would require three affirmative votes to carry the motion. If three commissioners voted on the motion to rescind, it would require two affirmative votes to carry the motion.

Where previous notice has been provided, which is the case in the present matter, a simple majority of the voting members is required to carry the motion. Ms. McKechnie's suggestion that it would require at least four affirmative votes to carry the motion is simply incorrect. The requirement is a majority of the votes cast. RONR (11th Ed.), p. 400, pp. 1-18.

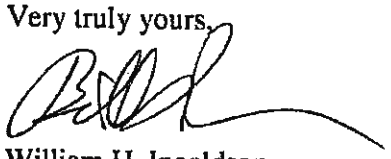
Ms. McKechnie may be basing her advice on MSBC 15.08.075, which provides that all board actions shall be by a vote of the majority of the board's authorized membership. That provision, however, applies to substantive actions such as granting a CUP or approving a zoning

variance, not procedural matters. Pursuant to MSBC 4.05.080(A), procedural matters are governed by the current edition of *Robert's Rules of Order, Newly Revised.*

In conclusion, the motion that effectively excluded Commissioner Kendig from participation in this matter was improper and out of order. Consequently, it is null and void. As a point of order, the chair should declare that motion null and void. If a commissioner wants to bring a proper motion to exclude Commissioner Kendig, such a motion must be seconded and two-thirds of the voting members must vote in favor of the motion, in order for it to carry. Commissioner Kendig should be permitted to vote on any such motion.

If a motion to rescind the previous motion is brought, a simple majority of the votes cast is required to pass the motion to rescind. Again, however, such a motion is not necessary in the present matter because the underlying motion should be declared null and void.

Very truly yours,



William H. Ingaldson

Good Afternoon Commissioners,

Commissioner Rauchenstein has provided me with written notice that on December 15th he will be making a motion to rescind the vote to recuse Commissioner Kendig from deliberations on Resolution 14-33, CMS Monofill. It will take four "yes" votes to rescind the previous motion.

If the vote to rescind passes, Chair Klapperich will offer Commissioner Kendig an opportunity to make a statement. Commissioners, staff, and the applicant will have an opportunity to question Commissioner Kendig. Commissioners will then vote on whether Commissioner Kendig has a conflict of interest.

If the vote to rescind does not pass, the original decision will stand.

The remaining commissioners will then again be asked the Conflict of Interest question and the commission will proceed accordingly.

The commission will then move directly to public testimony.

Good evening,

I would like to make a motion to rescind the action of December 1st by the Planning Commission concerning the recusal of Bill Kendig.
Reasons:

1. There was confusion on how to proceed.
2. Mr. Kendig did not do business with the company that applied for the CUP.
3. Mr. Kendig did not feel that he had a conflict of interest.

Thank you,
Commissioner Vern Rauchenstein

Subject: Resolution 14-33, CUP for an Inert Material Monofil

Mary,

What is the status of the enforcement action against Central Monofil for illegal dumping activities at the subject property? If the case remains active, is it appropriate to accept an application for a CUP until that issue is resolved?

Tom Adams
Planning Commissioner, District 6

Subject: Proposed monofill

December 6th, 2014

Dear Planning commission members,

You have been urged by the applicant to not listen to any of the community's opinions because they are base on emotions and not fact. I would urge you to consider the very most important things in life are often emotionally based.

When a man has a gun held to his head, do you think he is thinking or he is feeling? We as humans have strong emotions when our lives are threatened, or when our family or tribe is threatened. I would venture to say the all of our wars are actions started by an emotional response. We do respond emotionally to a threat, that does not mean we are not thinking as well. I am responding to this threat to the women and men of our community, but especially the children, they that cannot speak for themselves yet must bear all the consequences of our actions and decisions.

No one has yet answered the question, what if something goes wrong? The MSB has stated that and I quote "It is possible that nothing will go wrong"..."the water table is a moving target." "It is with reservation we approve this permit." That was the most ambiguous and confusing statement.

I am a nurse and have been witness to doctors consenting people for surgery. Do you think a doctor would tell a patient, "it is possible nothing will go wrong, and I recommend this surgery ***with*** reservations as your blood flow is a moving target and we just might get it wrong, but here go ahead and sign this consent."

Would not you as a patient want to know more, to have more assurances than just "Well we hope this works out and even though it is not a necessary surgery, you could die."

This is what the applicant is asking us as the community to do. The applicant stands to reap all the benefits from a decision for the dump, while we the home owners and families stand to reap years of anxiety and pollution and ill health that goes along with that decision. I ask you, is it fair that one person's claim should outweigh a community of people?

I would also ask you all to hold yourselves to the upmost ethical standards and think of the good of entire community, not just a few. It was very disturbing to see one of the commissioners protect the other commissioner who was reluctant to recuse himself though he admittedly did business with the applicant. It reeks of GOBSAT..."good old boys sitting around a table" deciding things regardless of the community desires or needs. I am fervently hoping you are men of honor and integrity.

I am sure all of your are interested in the long term well-being of our beautiful Palmer. What effects one community effects all the communities of this Valley. I will be earnestly praying for you.

Sincerely,
Rose Williams RN, CNM

Subject: Landfill leachate

Is it possible to have information at tonight's Planning Commission meeting that explains how much leachate the Borough must remove from the MSB Central Landfill each year?
I understand they take tanker truck loads to Anchorage for disposal at Anchorage's septic dump site.
Thanks.

HANDOUT

From: Frankie Barker
Sent: Thursday, December 11, 2014 12:12 PM
To: Patti Kepler
Cc: Alex Strawn
Subject: RE: Contacting U.S. Army Corps of Engineers

Patti,

The Army Corps has the opportunity to comment on this application as do members of the public but has not submitted any comments so far.
Since there are no identified wetlands on the property, this project does not require Army Corps permitting to proceed. I've copied Alex Strawn, Development Services Manager, about your request for the Mat-Su Borough to contact the Army Corps about long-term solutions. Until the application goes through the Planning Commission process and a permit is or is not issued, it is premature for MSB to request assistance from Army Corps or any other agency since we don't know what operations will be permitted.

I've been involved with the Army Corps to update wetlands maps in the Mat-Su but am not involved in the permitting process for the CMS project.
If you have a contact person at the Army Corps who wants to connect with the Borough about the Central Monofill Services application, have them contact Alex Strawn at 861-7854.

Subject: Contacting U.S. Army Corps of Engineers

Dear Frankie Barker,

The following is a letter I submitted to the Mat-Su Borough Planning Commission and to the Alaska Department of Environmental Conservation for consideration in protest of issueing permits allowing Central Monofill Services to set up operations in the Mat-Su Valley at a site near my place of business.
I recently contacted the U.S. Army Corps of Engineers in an attempt to make them aware of my situation and to seek their advice/assistance in this matter. I was told they could be asked to get invoived to assist with long-term solutions. They were sympathetic but stated that their involvement/assistance would need to be requested by a local agency rather than an individual party. In this case, it would be the Mat-Su Borough needing to make that request. I was given your name as the person to contact regarding this matter and in-turn contact the U.S. Army Corps of Engineers to request their involvement. Please consider helping make this request possible. Thank you for your time and consideration in this matter.

December 8, 2014

To Whom it may concern,

My name is Patricia Kepler Goossen. I own and operate Kepler Park, a campground located at Mile 37.4 Glenn Highway. The property is situated on the shores of Kepler and Bradley Lakes. The nature of our business is to provide scenic camp/picnic sites and boat rentals to the public. I have serious concerns about the condition of our property and future of my business.

I believe operations being conducted at the gravel pit located at MSB Tax Parcel #17N02E18C010 and #17N02E19B006 have had, and will have, a gross negative impact on my property and business. It is my understanding that the placement of dams in man-made industrial ponds at the gravel pit owned by Central Recycling Services/Central Monofill Services are causing increased ground pressure which effects the surrounding aquifer. I also understand there are spillways from those ponds pumping huge amounts of water into the aquifer, resulting in a significant rise in water levels of nearby lakes and streams.
I have observed a drastic rise in water level of these lakes over the past two years and at an especially alarming rate during this past 2014 summer season! The water level has risen approximately one foot just since opening for business in May of this year! This was more than just the annual spring melt-off. The water level increased and continued to rise throughout the summer.

Areas of concern are:

1. Trees along shoreline: The rise in water level has caused flooding of our campsites along the shoreline. Survival of trees along these shorelines are now threatened because of water surrounding them at their base and root systems. Some of these trees are over one hundred years old. Two trees have died and had to be removed as a result of this flooding. Grass and other vegetation which was on dry ground is now under water and has been killed.
2. Camp/Picnic Sites: Also, as a result of this flooding, the shoreline is diminishing which reduces the amount of space required for our camp sites. One of our prime sites has been reduced to one quarter of its original useable space. Two other sites have been reduced to half their original size. Four other sites along the shoreline are also being threatened by rising water levels. **Loss of campsites results in loss of business.**
3. Boat rentals: We provide boat rentals to the public for recreation and sport fishing in Kepler and Bradley Lakes. Customers have always had access to both lakes by way of a channel of water between them. A bridge spans this channel so it is necessary for boaters to pass under it to access both lakes. The high water levels effect this part of our operations because there is no longer enough clearance under the bridge for boaters to pass through. Also, the launch area along the shore for our rental boats has been reduced from a width of approximately 18 feet to now only 6 feet of useable space.
4. Bridge access: The bridge referred to is situated on a Matanuska-Susitna Borough designated roadway (E. Kepler Drive). It serves as access to our campsites and also to the Matanuska Greenbelt Trail System. The increasing water level is threatening the stability of the bridge abutments. **Loss of access would result in loss of business.**

We have been in business as a campground for 62 years. Many pictures have been taken over the years, including this year, so we have a visual comparison of change in water levels and damages being done. Copies of those pictures are available upon request.

It has been suggested that I seek legal counsel in this situation; for the killing of trees on our property and for property damages potentially resulting in loss of business. Hopefully, my protest and those of my neighboring property owners will be heeded, putting a stop to operations by Central Monofill Services at the proposed location. I would also hope steps will be taken to reverse and correct these effects on the surrounding aquifer and to prevent further damage to property.

Another major concern is the potential contamination of ground water in areas surrounding this proposed monofill. There would be many types of highly toxic materials in the waste being processed at such a recycling operation. I have read the report of findings written by J.A. Munter Consulting, Inc., dated February 7, 2014 which was requested by, and submitted to, the Matanuska Susitna Planning and Land Use Department. With such research and knowledgeable conclusions presented as to the damaging effects of such a monofill system it is inconceivable how the issuing of a permit allowing CMS to operate can even be considered.

The aquifer in this area flows South/Southwest. Kepler and Bradley Lakes are located Southwest of the existing gravel pit where the monfill site would be; with the East end of Bradley Lake being closest. The distance can be measured, not in miles, but within just a matter of yards. Since Kepler and Bradley Lakes are connected by a channel of water Kepler Lake would be directly affected. The lakes in this area are fed by underground fresh water springs. It is already known that the materials disposed of in operations of a monofill dump site would inevitably result in the release of toxins into the ground water feeding these lakes. With the directional flow of ground water as it is, toxins from the monofill operation would leach into the nearby lakes and streams, ultimately endangering the fish and wildlife in these areas. These lakes also serve as a nesting area for water fowl. As previously mentioned, one aspect of our business is to provide access for sport fishing. It should be noted that nearly all the lakes in this area are stocked each year by the Alaska Department of Fish & Game and are open to the public for sport fishing. Keep in mind that if fish contaminated by such toxins were caught and used for human consumption it would in turn effect those people.

Another concern is air pollution. This area experiences frequent strong Easterly winds. Storage of waste debris and the recycling process of materials containing toxins; as listed in the Munter Report, would result in contaminants, including asbestos, becoming airborne and spreading to surrounding areas downwind; damaging the environment and posing serious health risks. The amount of debris littered over the surrounding areas, including the lakes, would be atrocious!

Central Monofill Services claims their monofill set-up and processing system would be environmentally "safe". Being a man-made set-up it is impossible to make even the everyday operations 100% safe. No system involving so many variables in management, ground exposure, weather, and unforeseen "acts of nature" can claim to have no risk of damages to the environment. I feel that the bottom line in this whole matter with the proposed monofill site is that there are no guarantees the environment would not be harmed and the damages would be irreversible. Is it truly worth putting the future health and well-being of humans at risk?

As to issuing any permits allowing Central Monofill Services to operate or not, I have a few points to be considered by the parties involved in making that decision. I believe that before making a final decision and taking a vote on an issue that will ultimately affect the lives and well-being of individuals and wildlife habitat in our community, now and for years to come, each one should be asked some questions and be required to give totally honest answers. First of all, they need to imagine themselves living in the area near the gravel pit where Central Monofill Services proposes to set up their monofill operations.

The questions would be:

1. "Knowing the information and warnings that have been submitted to you regarding the risk of ground water pollution, air pollution, and wind-blown litter if the monofill site was in operation...as a resident and/or property owner in the area near this site, would you be totally confident that the ground water is "safe" and be willing to drink the water from your well, be able to enjoy breathing the air out in your yard, and accept the accumulation of litter on your property?"

2. "If operations at CMS were happening, do you believe you would be able to sell your home or property once potential buyers learned of the known conditions and risks attached to purchase of your property?"

3. "If you were not a resident in this area, and were looking for property to purchase, would you consider buying property near the monofill site?"

4. "Considering all the information and warnings given; for the sake of those of us who are residents in this area and for the sake of our children and grandchildren who live here, can you, in all honesty and with a clear conscience, cast a "Yes" vote to approve Central Monofill Services being issued a permit to operate at this site?"

Thank you very much for your time and attention to this matter.

Sincerely,

Patricia Kepler Goossen

Subject: Inert Waste Monofill requirements

HANDOUT

Susan,

18 AAC 60.460 are the regulations that are specific to Inert Waste Monofills, in addition to all the applicable location and design standards. 460(b) is specific to liners.

I will be there tonight if there are other State regulatory questions.

Lori

18 AAC 60.460. Inert waste. (a) The requirements of this section do not apply to a waste management area where inert waste is disposed of within the boundaries of a MSWLF.
(b) Liners are not required at an inert waste monofill.
(c) If a groundwater monitoring system is required at an inert waste monofill, under 18 AAC 60.820, detection monitoring under 18 AAC 60.840 and 18 AAC 60.850 during the active life of the monofill will be required only if the department
(1) determines that non-inert waste is or has been present at the site;
(2) detects evidence of a spill or groundwater contamination; or
(3) finds unexplained contamination in nearby wells.
(d) The owner or operator of an inert waste monofill who accepts combustible inert waste shall maintain fire control equipment and make it available to extinguish any fires that start.
(e) The owner or operator of an inert waste monofill shall construct a final cover of soil material at least 24 inches thick, graded to promote drainage without erosion, and shall revegetate it. The department will approve an alternate final cover design if the applicant demonstrates that the alternate design will protect public health, safety, and welfare, and the environment. After completion of the final cover on a monofill with a groundwater monitoring system, the owner or operator shall conduct detection monitoring at the frequency required by 18 AAC 60.850(b). (Eff. 1/28/96, Register 137; am 10/29/98, Register 148)

HANDOUT

RESPONSE TO J. A. MUNTER'S LETTER TO THE MSB PLANNINING COMMISSION PERTAINING TO THE CONDITIONAL USE PERMIT FOR A PROPOSED MONOFILL NEAR PALMER, ALASKA-DECEMBER 1, 2014

In this document, Maddox & Associates, Inc. will respond to J.A. Munter's (JAM) first stated concern, that of the potential for large volumes of precipitation to pass through the proposed monofill, resulting in significant volumes of leachate entering the underlying aquifer.

JAM states that Maddox, Terrasat, and the Borough misinterpreted evaporation data to conclude that the site is semi-arid. He supports this statement by referring to a recent U.S. Geological Survey report in which the author, Kikuchi (2013), states (page 2) that the Matanuska-Susitna Valley is in a transition zone between maritime and continental climates, with the average annual precipitation measured at the Matanuska Agricultural Experimental Station near Palmer from 1917 to 2010 as 15.3 inches. Kikuchi further states that hydrologic processes at the land surface are strongly influenced by snow and ice cover which typically last from October until April.

It should be noted that Kikuchi does not name the climatic zone in which the proposed monofill will be located, just that it is neither maritime nor continental. He does, however state that the average annual precipitation available for soil infiltration (this includes rainfall, sleet, and snow) is 15.3 inches. Green, Bertetti, and Hernandez (2012) state that a semi-arid climate is defined as one having an average annual precipitation of less than 19.7 inches. It is apparent that the proposed monofill site is located in a semi-arid climate, and Kikuchi says nothing to contradict this fact.

In Technical Paper No. 27, *The Climate of the Matanuska Valley*, by the U.S. Department of Commerce, Weather bureau, March 1956, the author, Robert F. Dale, states that there is an

39371 San Thomas Court • Murrieta, CA 92562 • Cell: (951) 805-1100 • E-mail: smaddox@ca.rr.com

apparent "dry area" in the central portion of the valley, located near weather station number 14, the Matanuska Agricultural Experiment Station, with an average annual precipitation of 15.76 inches from 1917 to 1952. This is the same weather station referred to by Kikuchi and is located approximately 2.5 miles to the west of the proposed monofill site.

Dale (1956) describes the semi-arid climatic conditions in the Matanuska-Susitna Valley as follows:

"The Valley is bordered by an arm of the Pacific Ocean and lies less than 40 miles northwest of prince William Sound; however, the Chugach Mountains to the south and east, with peaks ranging from 7,000 to 10,000 feet, form an effective coastal barrier to all flow of moist Pacific air except from the southwest over Cook Inlet. therefore, maritime air masses are generally well modified by the time they reach the Valley, and precipitation is only a little greater than that in interior Alaska, averaging 16 to 20 inches a year in the central Valley area. The Alaska Range and Talkeetna Mountains to the north and the Chugach Mountains to the east protect the Valley from the extreme winter cold of the interior areas..."

An additional factor is the presence of two winds specific to the Matanuska-Susitna Valley, the Matanuska Winds and the Knik Winds. The Matanuska Winds blow down the Matanuska River Valley from the northeast in the autumn and winter, while the Knik winds come from the Knik River Valley and blow in from the southeast. Dale (1956) attributes these winds as a significant source of evaporation within the Valley.

The production of leachate in a landfill is governed by two primary factors:

- The annual precipitation;
- The amount of annual evaporation and evapotranspiration.

The net difference between annual precipitation and annual evaporation is the amount of water left over, and available for possible infiltration through the refuse--this water has the potential to become leachate. This general calculation is called the water balance--when the two factors are close in value, the potential for the production of leachate is low.

The average annual precipitation per the Matanuska AES Weather Station is 15.3 inches, while the average annual evaporation is 14.7 inches. The net difference is approximately 0.6 inches, a relatively insignificant amount. Aljaradin and Perrson state that, "for climates where annual precipitation is less than 15.75 inches, virtually all precipitation is evapotranspirated."

Percolation testing of residual materials at the Birchwood Monofill, Chugiak, Alaska indicated an average hydraulic conductivity of approximately 2.0x10-2 cm/sec. These monofill materials are typical of those that will be deposited at the Palmer monofill. Any water that may penetrate through the proposed final cap, will encounter a significant increase in hydraulic conductivity of the monofill materials, resulting in a significant increase in travel velocity by the water. This

increased velocity will allow infiltration without saturation--thus there will be no extended period of time for the water to "stew" within the refuse and possibly leach-out constituents. As a result, the water will pass rapidly down through the inert refuse material and there will be little time for the production of leachate.

It is apparent that JAM's concerns regarding the possible production of excessive leachate at the proposed monofill site near Palmer, Alaska are unfounded.

The remainder of JAM's concerns are thoroughly addressed in the previous documents submitted for review and approval.

If you have any questions, please feel free to call me at 951-805-1100.

Very truly yours,

Subject: water changes and seismic

Please see page 203 of the package for Maddox conclusions. "Thus, no long term fluctuation in groundwater levels beneath the Monofill are likely to occur." This same section identifies the base materials underlain by sands and gravels.

Many of these same conclusions on the aquifer and water levels can be made of the spill way issue. "water level fluctuations about a constant average state." reports indicate seasonal and yearly fluctuations plus or minus a foot around an average. Terrastat references 1' plus or minus as well in his findings.

Page 446 we addressed the seismic Issues and was supported in Attachment 16. We are working to get something else from the engineers confirming these calcs but may be a little late to get it today.

Subject: CMS monofill

HANDOUT

How anyone can think this is a good idea is beyond me. It can only have to do with greed. This location is on an AQUIFER. That alone makes this a terrible location for a monofill. Polluted water is a huge danger. Also – rising 40 feet above the highway? Do we not want tourists to visit Palmer anymore? What an eyesore. The gravel pit may not be the most beautiful part of Palmer, but at least gravel is natural! And the horrible winds we have here! We already have a problem with trash blowing around. Do we want our spring cleanup volunteers to have to pick up construction waste too? Or do we not want to have cleanup volunteers anymore? CMS has already shown a disregard for illegal dumping and we expect that they will suddenly straighten up and obey the law? That they will respect our right to have clean, fresh water and air and land? Or do we expect that they will do whatever is financially best for them? Even the borough's hired hydrologist doesn't want it here. I can't imagine that any resident (who isn't getting money from it) wants it here. Palmer is a beautiful place to live. I moved here from a big city to get away from pollution – air, water etc. This will ruin the beauty and cleanliness and freshness of Palmer and will keep people from wanting to live here. Who wants to live where there is pollution when you can get land elsewhere? Do we not care about the children that are growing up near the proposed site? What kind of effects this site could have on everyone in the area? Leaving it alone will not cause health problems, spoil or ruin anything, but turning it into a monofill most certainly will.

HANDOUT

P.S.

I would rather pay a higher city sales tax, property tax or heaven forbid, permission be given to Wal-Mart to build there than have a monofill there.

Subject: Palmer Dump. Planning Commission

HANDOUT

Dear Planning Commissioners,

We are writing to urge you to vote as representatives of the community you represent in regards to the CMS landfill permit to create a private dump at Mi. 38.3 Glenn HWY. Most of the community is opposed to this dump with valid reasons and threat to our tourism, quality of life, health and well being, environment etc.
The opposition to this dump far outweighs those in favor of the dump. Most of those favor are either employees, owners, have vested interest, or biased incorrect knowledge, etc.

It is hard to fathom that the Planning Commission would prefer the needs of a few business people in Anchorage who want to save money dumping their trash along our Glenn HWY National Scenic Byway instead of the Anchorage landfill because it is cheaper for them.

As members of the Planning Commission you are to vote for what is best for your local community that you represent. The community spent many hours in the study that Agnew Beck produced for the future of our region. That region has been designated as a National Scenic Byway and that parcel of land was designated to be a park that would compliment the Byway.

Our question to you is what is the basis on your vote. Is it to represent the community or your own opinion. You have a responsibility to vote for what is best for your community members, tourism, health and future of tourism in our valley.
Not for what is best for a few business men's pocket books.

Please vote against CMS Permit. A vote in favor of the permit is a vote against the will of the people in the Mat-Su Valley. A vote against the permit is a vote for the will of the people in the Mat-Su Valley.

Thank you for your service to the community

Subject: submission for Dec. 15 public hearing
Attachments: bmp guide 2014.pdf; ATSDRTestimony_Warren,Ohio.docx; Clark, et al..pdf

Hi Susan & Alex,

1)These reports are about hazards and best practices for C&D Landfills nationwide. They were suggested to me by Lynn Wilder, who is with The *Agency for Toxic Substances and Disease Registry* (*ATSDR*), which is s a federal public health agency of the **U.S. Department of Health and Human Services**. Lynn has headed up an initiative for ATSDR for the past several years on C&D Landfills looking at the health impacts and how to mitigate them. These reports have measurements from and statstics on C&D landfills from around the country, as well as case investigations of problematic C&D landfills. *ATSDR serves the public by using the best science, taking responsive public health actions, and providing trusted health information to prevent harmful exposures and diseases related to toxic substances.*

I suggest the borough add at least the following conditions to the proposed site to protect the public health, safety and welfare:

- Ban or put a limit on the amount of gypsum that can go into the site.
- Require a liner for collecting any leachate and a leachate collection system
- Require submittal of a new groundwater monitoring plan because of concerns that the current plan is deficient. Specifically, Munter noted wells are not n the right place to collect leachate.
- Require that water monitoring be independently verified

2012 US EPA Best Management Practices to Prevent and Control Hydrogen Sulfide and Reduced Sulfur Compound Emissions at Landfills That Dispose of Gypsum Drywall

Of the components of C&D waste materials, drywall is of special concern. It is a major component of C&D wastes, and its disposal in C&D landfills can result in the production of hydrogen sulfide. Drywall is composed of a core of gypsum ($CaSO_4 \cdot 2H_2O$), covered on both sides with a paper facing and backing. When the sulfate in the gypsum is exposed to water, it becomes solubilized in the landfill leachate, and hydrogen sulfide gas is produced through an anaerobic conversion process(

Best Practices: See pages 17 & 30, 31

1)Some limit or ban gypsum altogether

If do allow it, keep it segregated or track where bigger loads go. Keep near top of load to minimize contact with water.

2) Keeping water out is key.

17 states now have a minimum requirement for C&D landfills to collect and remove leachate

12 states require daily cover

3)Shredding makes things worse. The reduced size creates an increased specific surface area which can lead to greater rates of H_2S gas production compared

to larger, bulkier pieces of drywall.

ATSDR testimony on an investigation into a C&D site in Warren, OH that was declared an Urgent Public Health Hazard because of H2S

- ATSDR began investigation in August 2002
- More than 150 residents reported similar health effects that they and their families were experiencing, including nausea, headache, vomiting, eye irritation, fatigue, dizziness, and memory loss.
- ATSDR conducted an Exposure Investigation, sampling indoor and outdoor air in seven community locations for five months.
- Concluded the conditions posed an urgent public health hazard to citizens of Warren Township. ATSDR uses the "urgent public health hazard" conclusion for sites at which short-term exposures (less than 1 year) to hazardous substances or conditions could result in harmful health effects that require rapid intervention.

Notice

The U.S. Environmental Protection Agency (U.S. EPA) through the Office of Research and Development funded and managed the research described here under contract order number: EP-W-09-004 to RTI International in Research Triangle Park, North Carolina. It has been subject to the Agency's review and has been approved for publication as a U.S. EPA document. Use of the methods or data presented in this manual does not constitute endorsement or recommendation for use. Mention of trade names or commercial products does not constitute endorsement or recommendation.

Foreword

The U.S. Environmental Protection Agency (U.S. EPA) is charged by Congress with protecting the Nation's land, air, and water resources. Under a mandate of national environmental laws, the Agency strives to formulate and implement actions leading to a compatible balance between human activities and the ability of natural systems to support and nurture life. To meet this mandate, U.S. EPA's research program is providing data and technical support for solving environmental problems today and building a science knowledge base necessary to manage our ecological resources wisely, understand how pollutants affect our health, and prevent or reduce environmental risks in the future.

The National Risk Management Research Laboratory (NRMRL) is the Agency's center for investigation of technological and management approaches for preventing and reducing risks from pollution that threaten human health and the environment. The focus of the Laboratory's research program is on methods and their cost-effectiveness for prevention and control of pollution to air, land, water, and subsurface resources; protection of water quality in public water systems; remediation of contaminated sites, sediments, and ground water; prevention and control of indoor air pollution; and restoration of ecosystems. NRMRL collaborates with both public and private sector partners to foster technologies that reduce the cost of compliance and to anticipate emerging problems. NRMRL's research provides solutions to environmental problems by: developing and promoting technologies that protect and improve the environment; advancing scientific and engineering information to support regulatory and policy decisions; and providing the technical support and information transfer to ensure implementation of environmental regulations and strategies at the national, state, and community levels.

This publication has been produced as part of the Laboratory's strategic long-term research plan. It is published and made available by U.S. EPA's Office of Research and Development to assist the user community and to link researchers with their clients.

Cynthia Sonich-Mullin, Director
National Risk Management Research Laboratory

1. Introduction and Background

1.1 Issue Description and Report Objectives

Hydrogen sulfide (H_2S) gas can be emitted from both construction and demolition (C&D) debris and municipal solid waste (MSW) landfills. H_2S emissions may be problematic at a landfill as they can cause odor, impact surrounding communities, cause wear or damage to landfill gas (LFG) collection and energy utilization components, or contribute to the formation of explosive conditions. H_2S emissions at landfills have often been attributed to the disposal of gypsum drywall, though other sources such as sulfur-containing industrial wastes and biosolids from municipal wastewater treatment facilities can also contribute to H_2S production. Addressing problems from H_2S emissions at landfills can be costly and time consuming for landfill owners and operators. Several years of operational experience and research efforts have identified several key pieces of information regarding the conditions that can cause H_2S production, factors that result in H_2S production at landfills, and strategies to prevent these conditions from occurring and to minimize the release of H_2S to the surrounding environment when it is produced.

The U.S Environmental Protection Agency (U.S. EPA) Office of Research and Development, in coordination with U.S. EPA Region 5, commissioned the development of a document designed to provide landfill owners and operators with guidance on pertinent subject matter associated with H_2S production, emissions, prevention, and control at landfill sites. A previous effort (U.S. Environmental Protection Agency [U.S. EPA], 2006b) focused on practices to prevent and control H_2S emissions from C&D landfills that accept pulverized gypsum debris in Ohio. This document expands the scope of this previously developed guidance by consolidating additional landfill operational and research information from a broader knowledge base (both C&D and MSW landfills), including additional information regarding the science of H_2S formation and control, the results of case studies with field and laboratory measurement of H_2S, and updated best management practices (BMPs).

1.2 Intended Audience

This report provides regulatory agencies, landfill owners and operators, and other interested parties with information regarding the science of H_2S production and emissions at landfill sites, and information on BMPs to prevent and control these emissions. Emission levels are discussed in the context of published health and safety standards and health-based or nuisance-based thresholds.

1.3 Report Organization

This report is organized into six sections. Section 1 presents the objectives of this report and describes the report organization. Section 2 provides the fundamentals of H_2S generation, related emission or exposure standards, measured levels at C&D and MSW landfills, and information regarding production and emission of other reduced sulfur compounds (RSCs). Section 3 presents a review of measures to prevent and control the formation and/or emission of H_2S from C&D and MSW landfills. Section 4 describes site investigation and monitoring techniques for H_2S. Section 5 includes a framework that landfill owners and operators can use to develop a BMP guide for their facility. Section 6 provides a list of references cited in the report.

2. Fundamentals

2.1 Basics of H_2S

H_2S (CAS #7783-06-4) is a poisonous, irritating, flammable, and colorless gas, with a characteristic rotten-egg-like odor detectable by humans at low concentrations and a sweet odor at higher concentrations. H_2S (also known as hydrosulfuric acid, sewer gas, sulphuretted hydrogen, hepatic gas, sour gas, and stink damp) is naturally occurring and found in crude petroleum, natural gas, volcanic gases, and hot springs. There are also anthropogenic (man-made) sources of H_2S gas, such as food processing, coke ovens, paper manufacturing mills, tanneries, solid waste disposal facilities, petroleum refineries, and waste water treatment plants (WWTPs). H_2S gas is slightly heavier than air (specific gravity of 1.189) and may accumulate in enclosed, poorly ventilated, and low-lying areas. When released into the environment, H_2S has been observed to persist for approximately 18 hours (Agency for Toxic Substances and Disease Registry [ATSDR], 2006a) and up to 42 days, typically persisting longer in cold weather (Bottenheim and Strausz, 1980). In the atmosphere, H_2S transforms into sulfur dioxide (SO_2) and/or sulfuric acid (H_2SO_4).

The explosive limit of H_2S in air ranges from 4.3 to 46% (43,000 µL/L to 460,000 µL/L) (Centers for Disease Control and Prevention [CDC], 2000). It has an autoignition temperature of 260 °C, a National Fire Protection Association (NFPA) fire and health rating of 4, and a reactivity rating of 0 (scale 0–4) (CDC, 2000). The water solubility limit of H_2S is relatively high, with an equilibrium concentration of 4,132 mg/L at 20 °C (World Health Organization [WHO], 2003).

2.2 H_2S Regulatory Standards and Health Effects

The lowest detectable concentration of H_2S by humans has been examined by several investigators. Amoore (1985) conducted a literature review of 26 H_2S-related odor studies and found a median odor detection threshold of 0.008 µL/L (by volume). ***Figure 2-1*** displays reported odor threshold ranges reported by several different sources; differences in odor detection levels are primarily attributed to differences in individual olfactory systems and sensitivity.

The detectable concentration of H_2S does not necessarily equate to that of a nuisance level, although Amoore (1985) indicated that five of the studies reported a nuisance-level concentration of 0.04 µL/L, approximately five times the detectable odor threshold. Mean atmospheric (i.e., ambient) H_2S concentrations in the United States reportedly range between 0.00071 µL/L and 0.066 µL/L (U.S. EPA, 2010a). Close proximity to a natural or anthropogenic source of H_2S may produce ambient H_2S concentrations greater than the ambient mean.

Humans may not detect H_2S at high concentrations due to olfactory fatigue (which may occur at approximately 100 µL/L with a 2- to 15-minute exposure) and olfactory paralysis (reported at approximately 150 µL/L) (Beauchamp, 1984; U.S. EPA, 2010a). Thus, odor is not always a reliable indicator of the presence of H_2S and may not provide adequate warning of hazardous concentrations.

H_2S affects the body if inhaled or comes in contact with the eyes, skin, nose, and throat (Beauchamp, 1984, ATSDR 2006a, ATSDR 2006b, ATSDR 2006c). Respiratory protection can be used to prevent inhalation if sufficient engineering controls are not available; a self-contained breathing apparatus and supplied airline respirators (both supply a clean source of breathable air rather than purifying ambient air) are considered acceptable protection from H_2S (Kalusche, 2004).

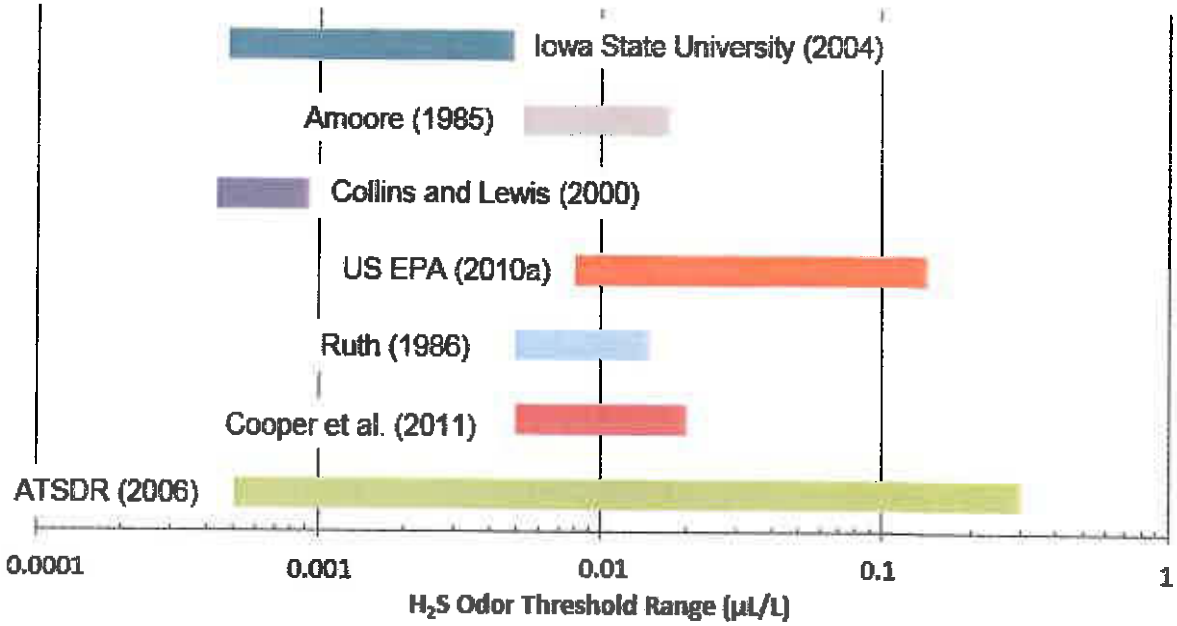

Figure 2-1. Odor Threshold Ranges Reported by Different Sources

Currently, there are no enforceable federal standards for offsite H_2S gas emissions from landfills, or H_2S monitoring requirements specific to landfills. However, health effects due to H_2S exposure have led to the development of H_2S workplace standards, which are typically expressed as a concentration and referenced to an exposure time limit. Nuisance standards and health-based guidelines for human exposure to H_2S in the United States have been developed by numerous agencies and organizations. Individual nuisance or health effects from H_2S exposure vary depending on:

- exposure duration
- exposure concentration
- individual factors (e.g., asthmatics).

H_2S blocks the oxidative process of tissue cells, reduces the oxygen-carrying capacity of blood, depresses the central nervous system, and causes respiratory failure and asphyxiation in high concentrations (Kalusche, 2004). At acute, lower-level concentrations, nausea, fatigue, loss of appetite, headaches, and irritation can occur (WHO 2003). The reported effect of low-level, long-term H_2S exposure in humans has been mixed in the technical literature. For example, Kalusche (2004) reports effects such as eye irritation, headache, photophobia, and blurred vision from long-term, low-level exposure. However, the WHO (2003) stated that "... effects in human populations exposed for long periods to low levels of (H_2S) cannot serve as a basis for setting tolerable concentrations because of either co-exposure to several substances or insufficient exposure characterization." WHO (2003) states that insufficient data on possible carcinogenicity of H_2S exists, and the compound has not been classified as a carcinogen (ATSDR, 2006b). WHO (2003) summarized human health effects at variable H_2S concentration levels based on acute exposure scenarios, shown in ***Table 2-1***.

Table 2-1. Health Effects and Approximate Corresponding H_2S Concentration, as Summarized by WHO (2003)

Health Effect	H_2S Concentration (µL/L)
No Observed Adverse Effect Level	0.0014
Odor threshold	0.007
Bronchial constriction in asthmatic individuals	2
Eye irritation	4 - 21
Fatigue, loss of appetite, headache, irritability, poor memory, dizziness	20
Olfactory paralysis	>100
Respiratory distress	>400
Death (likely a result of respiratory failure/arrest)	>500

Acute Exposure Guideline Levels (AEGLs) (U.S. EPA, 2010a) for H_2S have been developed and are intended to describe the risk to humans that would result from once-in-a-lifetime, or rare, exposure to airborne chemicals. The AEGLs for H_2S were established based on a three-tiered system (level 1, level 2, and level 3) that acknowledges the severity of expected health effects. Additionally, many other agencies have published their own guidelines, screening levels, or health-based levels for H_2S, which are detailed in ***Appendix A*** of this report.

Some U.S. EPA regions and states have developed or adopted H_2S air quality standards. Some examples of these standards are included in ***Table 2-2***. This list is not exhaustive and is not intended to encompass all regional, state, or local H_2S standards, guidelines, and screening levels. Additionally, the standards may not apply to all areas in the region, state, or municipality.

Table 2-2. Examples of State and Regional H_2S Gas Standards, Guidelines, and Screening Levels

Standards, Guidelines and Screening Level Description	Concentration (µL/L)
California Ambient Air Quality Standard	0.03 - 1 hour average
Maine Ambient Air Guidelines	0.03 - 30 minute average 0.001 - 1 year average
Minnesota Ambient Air Quality Standards (7009.0080- applies to property boundary, primary standards)	0.05 - 30 minute average not to be exceeded > 2 times per year 0.03 - 30 minute average not to be exceeded > 2 times in any 5 consecutive days
Montana Ambient Air Quality Standards (17.8.214)	0.05 - 1 hour average not to be exceeded > once per year
New Mexico (20.2.3.110)	0.01 - 1 hour average
New York Ambient Air Quality Standards (257-10.3)	0.01 - 1 hour
Pennsylvania Ambient Air Quality Standards	0.005 - 24 hour 0.1 - 1 hour
U.S. EPA Region 9 Regional Screening Levels (Also used by U.S. EPA Region 3 and 6[1]	0.0015 Residential Air 0.0063 Industrial Air

Note: [1] Regional Screening Levels are risk-based target levels developed by guidance from the U.S. EPA Superfund program that are used for Superfund sites. They are generic screening levels considered by U.S. EPA to be protective for humans (including sensitive groups) over a lifetime.

2.3 H_2S Formation in Landfills

H_2S is generally formed in a landfill environment through the reduction of sulfate (SO_4^{2-}). Sulfate-reducing bacteria (SRB) causing SO_4^{2-} reduction to H_2S are commonly observed in groundwater, wastewater treatment plants, and sewers. Additionally, H_2S production is attributed to hydrolysis of sulfur-containing minerals (e.g., FeS_2) in natural sources such as volcanoes and hot springs (ATSDR, 2006b).

The reduction of SO_4^{2-} represents the primary generation mechanism in landfills; SO_4^{2-} may be present from gypsum or other waste sources in the landfill (e.g., WWTP sludge), though the mass of reducible sulfur minerals in drywall far exceeds that typically present in WWTP sludge. Gypsum is hydrated calcium sulfate ($CaSO_4 \cdot 2H_2O$) and is the major component of gypsum drywall panels, which normally consists of 90% (by weight) gypsum and 10% backing paper. Gypsum drywall is also known as plasterboard, gypsum board, gyproc, gib board, sheetrock, and wallboard, and hereafter referred to in this report as *gypsum drywall*.

Gypsum drywall is a component of C&D waste and can be disposed of in C&D landfills or MSW landfills, where it can arrive in bulk form or in size-reduced (pulverized or fine) form. Gypsum may also be present in landfills (particularly MSW landfills) that accept screened, fine-grained material from C&D recycling operations, which is typically referred to as recovered screen material (RSM). RSM is typically sized from 3/8" to 2" or more and can contain a varying amount of size-reduced gypsum (the degree of gypsum is largely dependent on the practices of the C&D recycler to remove gypsum prior to processing the C&D at its facility). There are several contributing factors that may result in the production of H_2S in landfills. These factors are summarized in ***Table 2-3***.

Table 2-3. Summary of Factors that Contribute to the Production of H_2S in Landfills

H_2S Formation Factor	Discussion
SO_4^{2-} Source	Sources of reducible sulfur in landfills may include gypsum drywall, WWTP sludges, or other residential, commercial, or industrial wastes (e.g., auto shredder fluff impacted by lead-acid batteries). Gypsum may be present in larger pieces of drywall or size-reduced drywall, and may be present in fine particles contained in RSM.
Moisture	Moisture provides a medium for SRB growth and chemical reactions to occur. Infiltration of stormwater into the waste, lack of leachate collection and removal, and moisture inherent to deposed waste can all act to contribute to moisture within landfills.
Organic Matter	Production of H_2S requires organic matter as a substrate for SRB utilization. Several studies (Hardy Associates, 1978; Townsend et al., 2002, New Hampshire Department of Environmental Services 2004) have indicated organic matter presence in C&D landfills is not limiting, and that the paper backing on drywall is sufficient to sustain a viable community of SRB that can produce H_2S. MSW landfills have substantially more organic matter compared to C&D landfills because of the characteristics of wastes that are normally deposited in MSW landfills.
Anaerobic Conditions	Anaerobic conditions (i.e., a lack of oxygen) are required for the reduction of SO_4^{2-} into H_2S. Anaerobic conditions form within C&D and MSW landfills following placement and subsequent compaction of waste material.
pH Conditions	SRB typically thrive in environments with pH ranging from 6 to 9, though SRB have been observed in environments with greater acidity (Koschorreck, 2008). These pH conditions are consistent with those normally found in C&D and MSW landfills.
Temperature Conditions	SRB can thrive over a wide range of temperatures – investigators have observed SRB in the thermophilic range at temperatures up to 80 °C (Elsgaard et al., 1994) and at cryophilic ranges as low as -1.8 °C (Knoblauch and Jorgensen, 1999).

SRB produce H_2S gas from the SO_4^{2-} present in gypsum and organic carbon waste materials, as demonstrated by using formaldehyde (CH_2O) as an example (Townsend et al., 2002; Bogner and Heguy, 2004):

$$SO_4^{2-} + 2CH_2O \rightarrow 2HCO_3^- + H_2S$$

Based on stoichiometry, one hundred tons of SO_4^{2-} have the potential to produce 35 tons of H_2S gas (Bogner and Heguy, 2004).

Laboratory studies have examined H_2S production potential in batch reactors or in simulated landfill columns. Yang et al. (2006) measured H_2S concentrations as high as 65,000 µL/L in a reactor containing only drywall that was flushed with a synthetic precipitation leaching procedure solution, which is a simulated rainfall used in standard laboratory leaching tests. Additionally, Yang et al. (2006) tested a simulated column with mixed C&D debris (wood and drywall) and flushed in a similar fashion as the drywall-only experiment, and the results showed an H_2S concentration of approximately 40,000 µL/L.

2.4 Factors Impacting Emission of LFG

The emission of landfill gas (LFG) from landfills depends on the different transport mechanisms associated with the LFG and the factors that influence the transport mechanisms. The mechanisms and influencing factors are presented in ***Table 2-4***.

Table 2-4. Transport Mechanisms and the Factors That Impact LFG Emission (U.S. EPA 1997)

LFG Transport Mechanism	Factors that Impact Emission
Diffusion Through the Waste or Cover Soils	• Soil porosity • Concentration gradient • Diffusivity of the LFG • Thickness of cover soil
Diffusion Through the Air Boundary Layer	• Wind speed, which is related to atmospheric stability • Concentration gradient • Diffusivity of the LFG
Convection	• Pressure gradient (which is influenced by LFG production rates). A larger pressure gradient between the landfill and the atmosphere results in greater emissions.
Displacement	• Compaction or size reduction of waste • Settlement of waste • Water table fluctuations (unlined sites) • Changes in atmospheric pressure

H_2S migrates with LFG through pore space and soil cover in landfills to escape to the atmosphere. H_2S is heavier than air and thus tends to settle in low-lying areas, including outside of the landfill boundary. Pressure changes (causing convection) in the landfill are influenced by nutrient availability, refuse composition, moisture content, landfill age, temperature, pH, oxygen availability, the presence of a LFG collection system, and wastes that may inhibit biological activity (industrial waste, or waste containing large quantities of metals). Landfill settling and compaction can also cause displacement of LFG and force the gas to migrate out of the landfill. The displacement can occur also through water table fluctuations, which are affected by the presence of a liner, evaporation, precipitation, and variations between horizontal and vertical permeability. If the landfill is unlined, the ground water table and surrounding water bodies may have an impact. Xu et al. (2014) developed a model to predict emitted concentrations of H_2S based on conditions that may be present at a specific site (e.g., cover soil thickness, cover soil compaction, and moisture content of the cover soil).

H_2S has a relatively high solubility, thus the gas tends to dissolve in landfill leachate and serve as an emissions source in leachate collection areas or areas on a landfill where leachate is exposed to the atmosphere (Profumo et al., 1992; Reinhart et al., 2004).

Evaluation of where H_2S concentrations are measured at landfills is an important consideration, as the implications measured inside of the landfill differ from those measured at the property boundary. ***Figure 2-2*** presents an illustration of a landfill and the locations where LFG samples including H_2S may be collected. Additional discussion regarding these potential sampling locations is presented below.

- **LFG Header Pipe, LFG Well, or Soil Vapor Probe.** Concentrations measured at these locations would be expected to be the highest measured H_2S levels at a landfill, as limited dilution with atmospheric air would have occurred. Normally, measurements are conducted by directly connecting the monitoring instrument to the pipe or probe. Monitoring H_2S at these points may help to identify areas of high concentrations in the landfill or allow the operator to evaluate overall collected H_2S concentration, which has importance particularly at sites with energy conversion systems.
- **Landfill Surface.** Measurements conducted at the landfill surface can identify areas of high concentration and assess concentrations to which landfill workers or site visitors may be exposed. Measurements at the surface are typically conducted anywhere from just above the surface to the normal breathing zone, depending on the goals of monitoring and the instrument used.
- **Ambient Air.** Measurements in ambient air are typically conducted to measure the concentration of H_2S that may be present at the landfill's perimeter, property boundary, or even offsite. Measurements can be conducted with fixed instruments (which analyze H_2S levels at a single point) or using a roving instrument to capture a larger area.

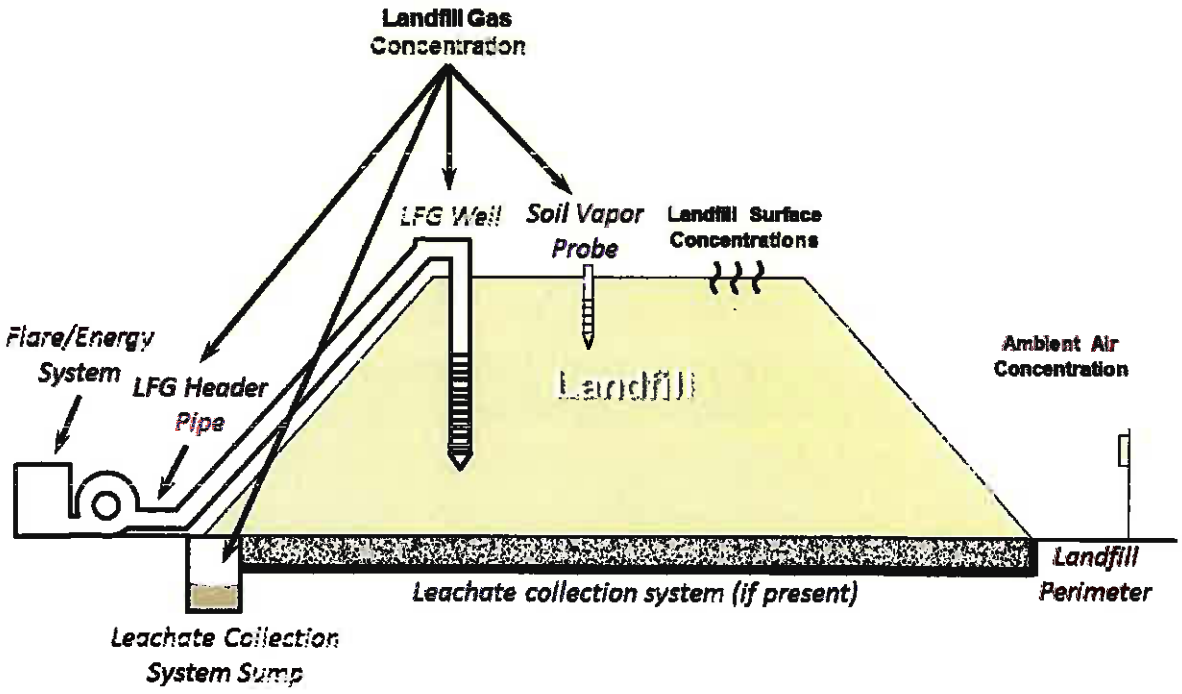

Figure 2-2. Illustration Indicating Common Landfill Processes and Examples of Areas Where H_2S May Be Sampled

Sections 2.6 and 2.7 discuss H_2S production and measured concentrations at C&D landfills and MSW landfills, respectively. Information in each section is grouped to acknowledge measurements of H_2S inside of landfills, on the surface of landfills, and in ambient air on or off of the landfill property. The concentrations measured at each of these points have different implications with respect to operational impacts, environmental impacts, and human health impacts.

It is noted that the monitoring or measurement of H_2S is not necessarily a standard practice at C&D or MSW landfills, and that some data in Section 2.6 and 2.7 were gathered based on published information at sites where an actual or suspected problem with H_2S production or emissions was present. Therefore, the concentrations presented in this report should not necessarily be viewed as "typical" or "average" for C&D landfills or MSW landfills, but simply examples of concentrations that may be encountered. As discussed previously, numerous site-specific factors (waste types and quantities, weather conditions, topographic conditions, distance to receptors) play a role when considering whether a landfill has H_2S production or emissions at problematic levels.

2.5 Composition of Waste Disposed of in C&D and MSW Landfills

Assessing the composition of waste disposed of in C&D debris and MSW landfills is important to understand the potential for the formation of H_2S in these facilities. Gypsum drywall is one of the major components of the C&D debris waste stream. Staley and Barlaz (2009) summarized several statewide studies that estimated the composition of C&D debris discarded at landfills. The mean weight-based composition was calculated and is presented in ***Figure 2-3***. Based on composition data reported by seven states in the United States, the average weight-based composition of discarded gypsum in C&D debris was calculated to be approximately 10%.

U.S. EPA (1998a) and (2009) presented estimates of building-related C&D debris generation in the United States based on an assumed waste weight per unit construction activity area and Census Bureau data on construction industry project activity. These studies estimated a building-related C&D debris generation rate estimate of 136 and 170 million tons for years 1996 and 2003, respectively. The estimated recycling rate of C&D reported by U.S. EPA (1998a) ranged from 20 to 30%; the most commonly recycled components included concrete, asphalt, metal, and wood. Assuming that the drywall recycling rate based on the 1996 data was minimal, the amount of disposed gypsum drywall may be on the order of 10 million tons annually in the United States.

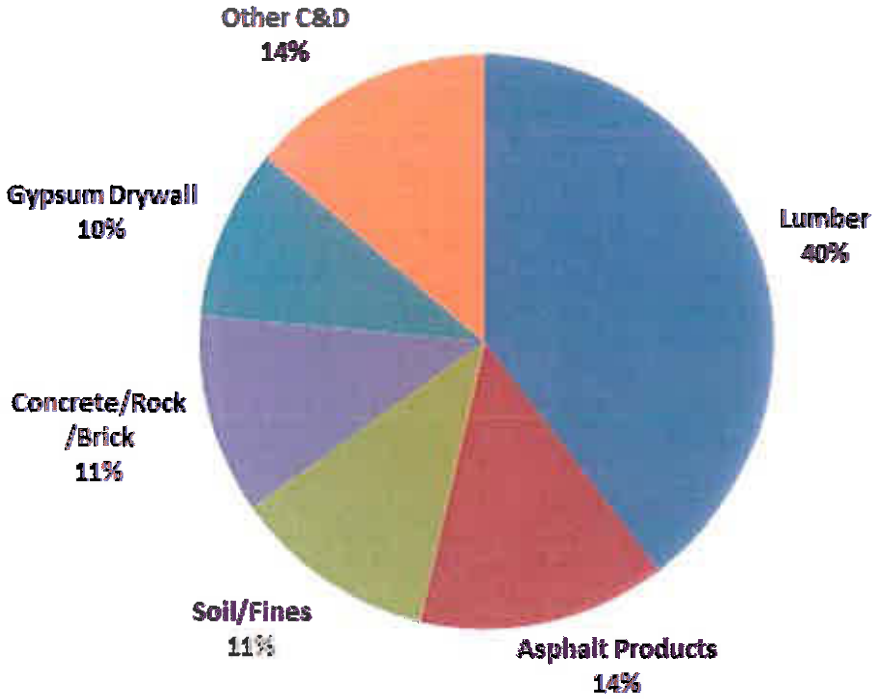

Figure 2-3. Mass-Based Discarded C&D Debris Composition Based on Reported Data From Seven States (adapted from Staley and Barlaz, 2009)

The generation of MSW in the United States is estimated annually by the U.S. EPA. In 2010, total MSW generation was estimated to be 250 million tons, with an approximately 34% recycling rate and 54% discard rate (U.S. EPA, 2011). Staley and Barlaz (2009) summarized reported statewide waste composition data for discarded MSW, as shown in ***Figure 2-4***. It is important to note that many MSW landfills accept waste other than MSW (e.g., C&D debris, industrial wastes, and ash). C&D debris may be disposed of at an MSW landfill for a variety of reasons, including (but not limited to) lack of recycling markets, lack of permitted C&D debris-only facilities, and disposal costs.

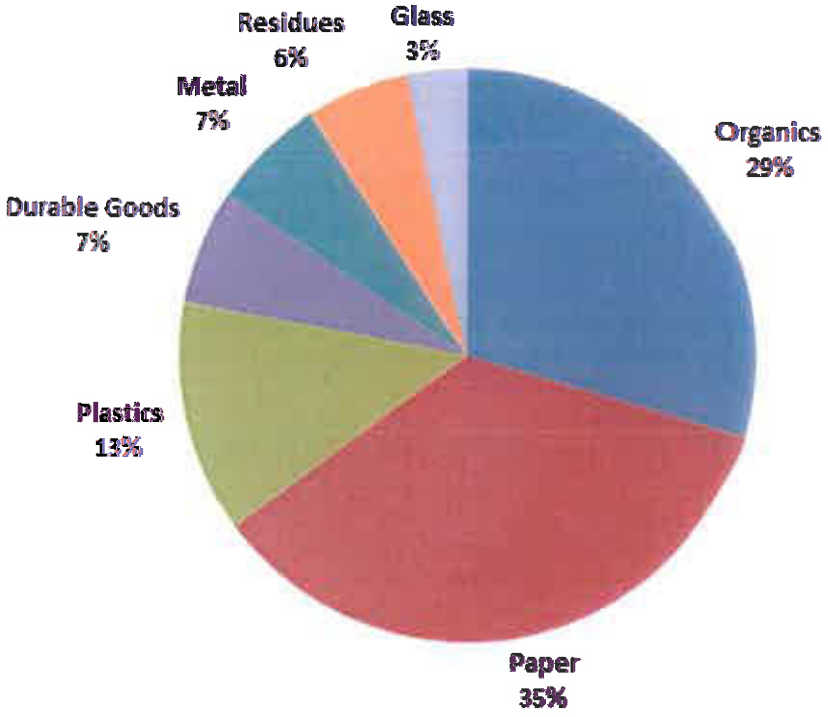

Figure 2-4. Discarded MSW Composition by Mass (adapted from Staley and Barlaz, 2009)

Accurate nationwide estimates of the fraction of waste received at MSW landfills that is composed of C&D debris are not available. However, statewide characterization studies can provide relevant data. For example, a statewide waste characterization study conducted in Delaware that examined the waste composition of six facilities owned by the Delaware Solid Waste Authority found that approximately 23% (weight basis) of materials handled at these facilities was C&D debris (Delaware Solid Waste Authority, 2007). So while accurate nationwide estimates of the fraction of waste disposed of in MSW landfills that consists of C&D debris are not available, the data from Delaware show that the amount of C&D debris disposed of in MSW landfills can be substantial.

2.6 H_2S at C&D Debris Landfills

2.6.1 Factors Contributing to H_2S Formation and Emission at C&D Landfills

The data presented in Section 2.5 show that potentially large quantities of SO_4^{2-} from gypsum drywall disposal are available at C&D landfills. Coupling this with the fact that these landfills harbor the broad conditions that need to exist at landfills for H_2S formation to occur, the potential exists for appreciable quantities of H_2S to form at C&D landfills. Additional conditions that may promote H_2S production at C&D landfills are summarized in ***Table 2-5***.

Table 2-5. Conditions That May Promote H_2S Production at C&D Landfills

Condition or Factor	Discussion
Cover Soil Requirements	Cover soil requirements at C&D landfills (which can reduce the amount of stormwater that infiltrates into the waste and can also serve to reduce quantities of H_2S emitted as described later) are limited in some states. A review of state-mandated cover soil requirements indicated that 12 states require daily cover, 14 require weekly cover at a minimum, and 24 states have no operational cover requirements or a cover placement requirement less frequent than weekly (U.S. EPA, 2012b). The lack of a cover soil requirement may tend to increase the production of H_2S by promoting conditions that cause its formation.
Bulky Nature of C&D Debris	The bulky nature of C&D debris may allow moisture to more readily infiltrate into the waste or percolate through the waste when compared to another waste stream such as MSW.
Liquids management	As of 2012, 17 states in the US have a minimum requirement for C&D landfills to collect and remove leachate (U.S. EPA, 2012b). Depending on local geology (e.g., presence of a low permeability layer underlying the waste or presence of groundwater at or near the waste bottom), conditions may form that allow for the build-up of moisture or the contact of groundwater with the waste mass. This could increase moisture content of waste and result in greater H_2S formation, but could also result in greater leaching of SO_4^{2-} into solution, thus representing a potential source for H_2S off-gassing within or beyond the landfill footprint. Also, recirculation of leachate into the waste and poor surface water management can lead to an increase in waste moisture content.
Placement of Size-Reduced Gypsum Drywall in the Landfill	Some C&D landfills accept or have accepted size-reduced C&D debris, which can include ground-up pieces of gypsum drywall. The reduced size creates an increased specific surface area which can lead to greater rates of H_2S gas production compared to larger, bulkier pieces of drywall. Size-reduced gypsum drywall may be in the form of processed C&D debris or in RSM.

2.6.2 H_2S Concentrations Measured at C&D Landfills

This section summarizes measured H_2S concentrations at C&D landfills, focusing on the three major data types presented in ***Figure 2-2***. This includes data collected in the waste or LFG extracted from the waste, at the landfill surface, and in ambient air at or near C&D landfills. The data indicate levels of H_2S that may be encountered at a C&D landfill based on what has been reported in the technical literature and other sources.

H_2S Measurements in LFG at C&D Landfills

Although most C&D landfills do not have active LFG collection, data from a limited number of sources were examined to assess concentrations of H_2S that have been measured at C&D landfills. Lee et al. (2006) sampled in-situ LFG using soil vapor probes installed 0.3 m below the landfill surface and from existing passive gas collection vent wells at 10 C&D landfills. The results showed highly variable H_2S concentrations, ranging from <0.03 µL/L to 12,000 µL/L. Collected samples from the C&D landfill with the highest observed H_2S concentrations, which showed a mean concentration of 2,110 µL/L and a median of 1,800 µL/L, were collected from passive gas collection vent wells.

Sampling from two leachate cleanout lines at a C&D landfill in Ohio showed H_2S concentrations as high as 1,995 µL/L and 600 µL/L (Rizzo and Associates, 2002). A 74-acre C&D landfill in Kansas experienced H_2S odor problems attributed to the collection and buildup of stormwater within the waste footprint because of a low-permeability shale layer underlying the site and lack of a mechanism to remove the liquid. The landfill contains 25 onsite wells that serve as the LFG collection system. Degner (2008)

reported an average collected LFG H_2S concentration of 54 µL/L, with a range of 4 to 120 µL/L at a facility in Kansas.

H_2S concentrations were measured at a New York landfill with two phases devoted to C&D disposal. Phase 1 consisted of processed C&D debris and Phase 2 consisted of bulk C&D debris (McCarron and DiMaria, 2007). H_2S measurements conducted in 2000 in Phase 1 reached 9,000 µL/L. Investigations conducted between 2001 and 2006 in Phase 1 measured concentrations as high as 12,000 µL/L and Phase 2 concentrations as high as 18,000 µL/L.

Figure 2-5 summarizes the measured concentrations of H_2S within C&D landfills reported in the investigations described above.

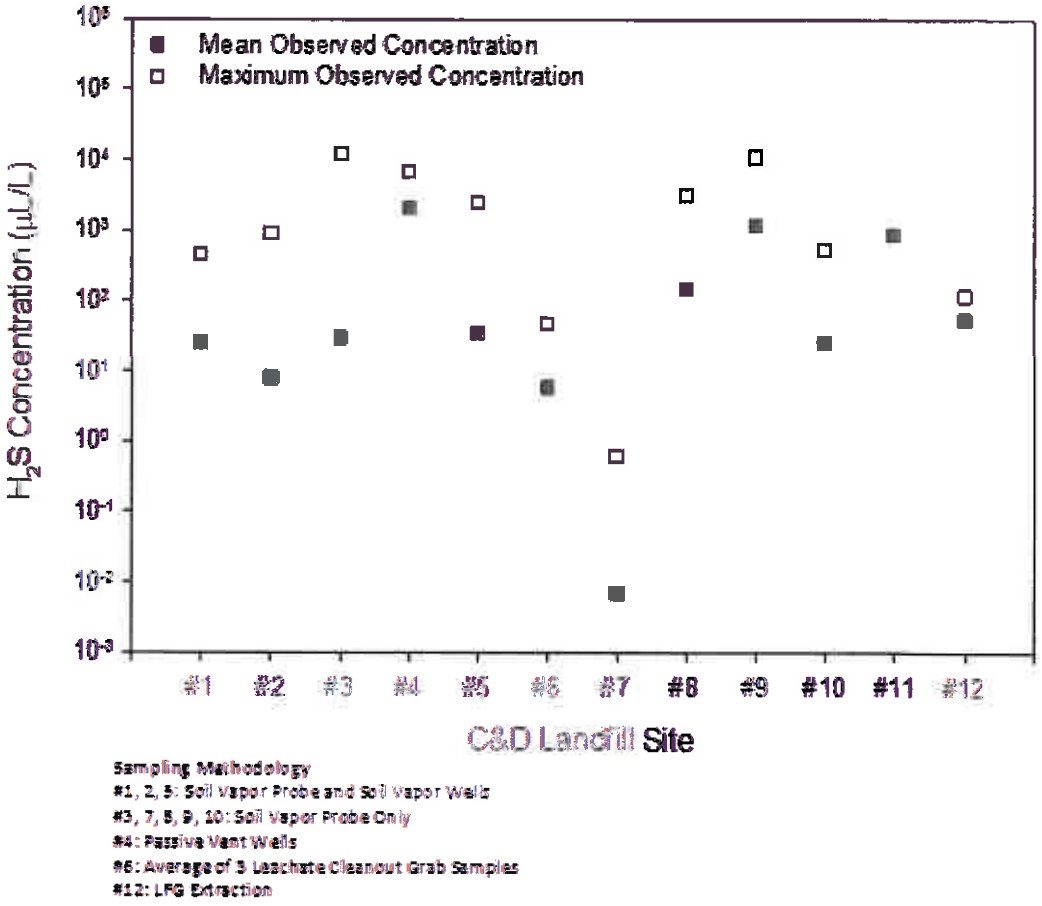

Figure 2-5. Reported H_2S Concentrations Measured Within Landfilled C&D Waste or in an LFG Well at a C&D Landfill (#1 – 10: Lee et al. (2006), #11: Rizzo and Associates (2002), #12: Degner (2008))

H_2S Concentration Measurements at the Landfill Surface of C&D Landfills

Lee et al. (2006) measured H_2S concentrations on the surface of 10 C&D landfill sites in Florida to measure concentrations near soil vapor probes. The results indicated readings between <0.003 µL/L and >50 µL/L; detections of H_2S at the landfill surface occurred in 48% of measurements. The two sites with

the highest observed H_2S concentrations (maximum concentrations of >50 µL/L at the surface) were sites known to accept processed C&D debris.

The ATSDR (2007) reported on H_2S concentrations measured using personal badge monitors affixed to landfill workers during the work day at a C&D site. The maximum observed concentration from this evaluation was 130 µL/L. ***Figure 2-6*** summarizes the reported H_2S surface concentration measurements from these studies. The figure shows that three of the landfills had a maximum H_2S concentration greater than 10 µL/L, which exceeds the AEGL-1 standard presented in ***Appendix A***, and other guideline levels.

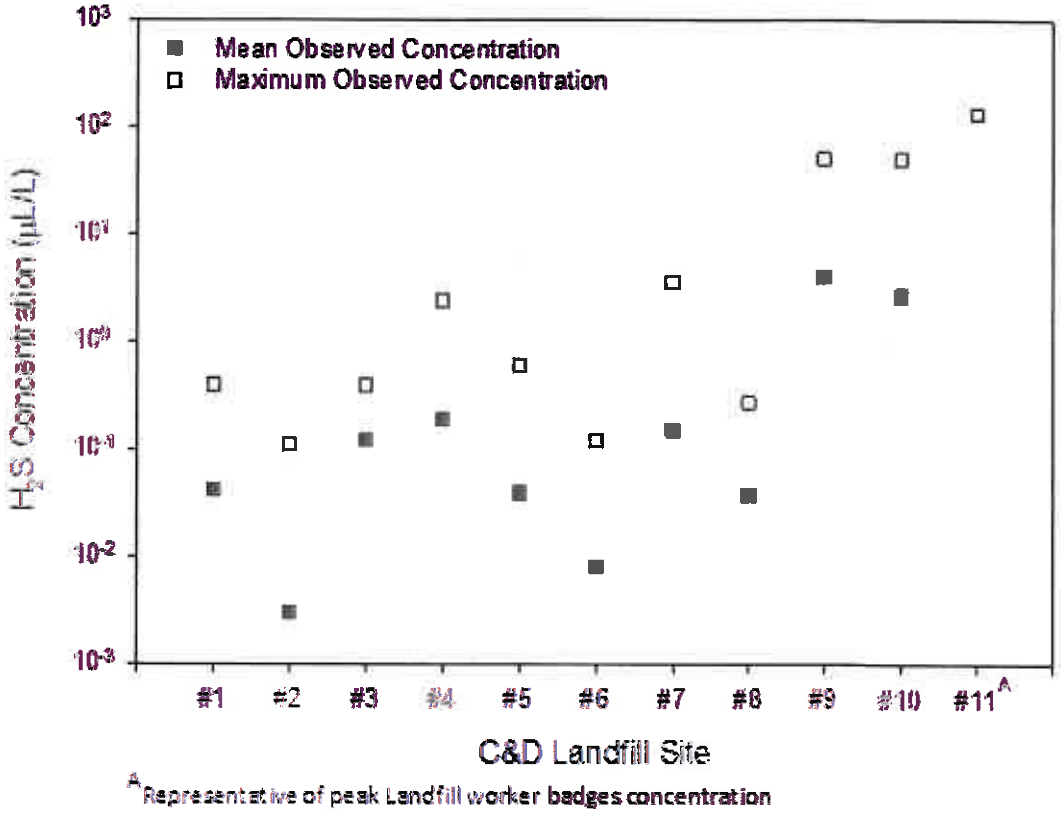

Figure 2-6. Reported H_2S Concentrations Measured at the Surface of 11 C&D Landfill Sites in Florida (#1 – 10: Lee et al. (2006), #11: ATSDR (2007))

Eun et al. (2007) measured the H_2S flux from five C&D landfills (n = 20 measurements per site) in central Florida during the summer using a dynamic flux chamber. Measured flux rates ranged from 0.192 – 1.76 mg/m^2-day. These flux rates are less than those reported for LFG flux rates reported by Amini and Reinhart (2012) at MSW landfills, which was approximately 20 to 120 g/m^2-day. The H_2S measured by Eun et al. (2007) was detected at frequencies ranging from 10% to 55% of measurements, indicating that emissions through the cover of C&D landfills were variable.

Ambient H_2S Concentrations Measured Near C&D Landfills

Residents living near a C&D landfill in Florida with documented odor nuisance problems wore H_2S personal badge monitors for one month. The results showed 15 positive detections of H_2S, ranging from 0.015 to 0.123 µL/L. Additionally, stationary ambient air monitors detected H_2S concentrations up to 0.224 µL/L (ATSDR, 2007).

Cooper et al. (2011) utilized techniques to assess H_2S emission rates from C&D landfills to calculate an odor buffer distance beyond which nuisance odors would not be detected. The study measured H_2S concentrations near a C&D landfill in Florida and subsequently used the measured results in a model that used a problematic odor threshold (0.015 µL/L, which was established based on a literature review of six studies) to delineate the odor buffer distance from the landfill. H_2S readings were measured in the morning, where higher concentrations were more likely because of lower atmospheric turbulence. On the first site visit, H_2S concentrations from 0.2 µL/L to 0.4 µL/L were observed at two corners of the landfill, at a maximum of approximately 40 m from the edge of the landfill. H_2S concentration declined to 0.015 µL/L at approximately 70 to 200 m from the landfill edge. On the second site visit, H_2S measurements surrounding the landfill was >0.8 µL/L.

Table 2-6 shows the modeled buffer distances with their corresponding predicted H_2S concentration ranges. The calculated buffer distance varied substantially between the two visits (which was a reflection of the difference in measured concentrations at the landfill). This demonstrates a couple of important phenomena: 1) that the concentration of H_2S produced from landfills has the potential to be highly variable, even when measured at a similar time of day at the same location; and 2) based on the results of site-specific atmospheric modeling, the impact that the source H_2S concentration has on the area surrounding the landfill that may experience problematic H_2S concentrations is dramatic.

Table 2-6. Calculated Modeled Minimum Nuisance Odor Buffer Distances Based on H_2S Measurements Collected at a Florida C&D Landfill (adapted from Cooper et al., 2011)

Measured H_2S Concentration Near Landfill (µL/L)	Site Visit #1: Buffer Distance (m)	Site Visit #2: Buffer Distance (m)
0.0 – 0.015	600	2,800
0.015 – 0.030	400	2,400
0.03 - 0.10	200	2,000
>0.10	100	1,600

A C&D landfill site with reported odor issues in Ohio reported monitoring data from three ambient monitoring locations (bordering the landfill perimeter) of 60-minute rolling average H_2S concentrations of 0.154 µL/L, 0.043 µL/L, and 0.071 µL/L during September 2004 (Tetra Tech, 2004).

Figure 2-7 displays ambient air H_2S data collected from three different sites as reported by ATSDR (2007), Tetra Tech (2004), and Cooper et al. (2011).

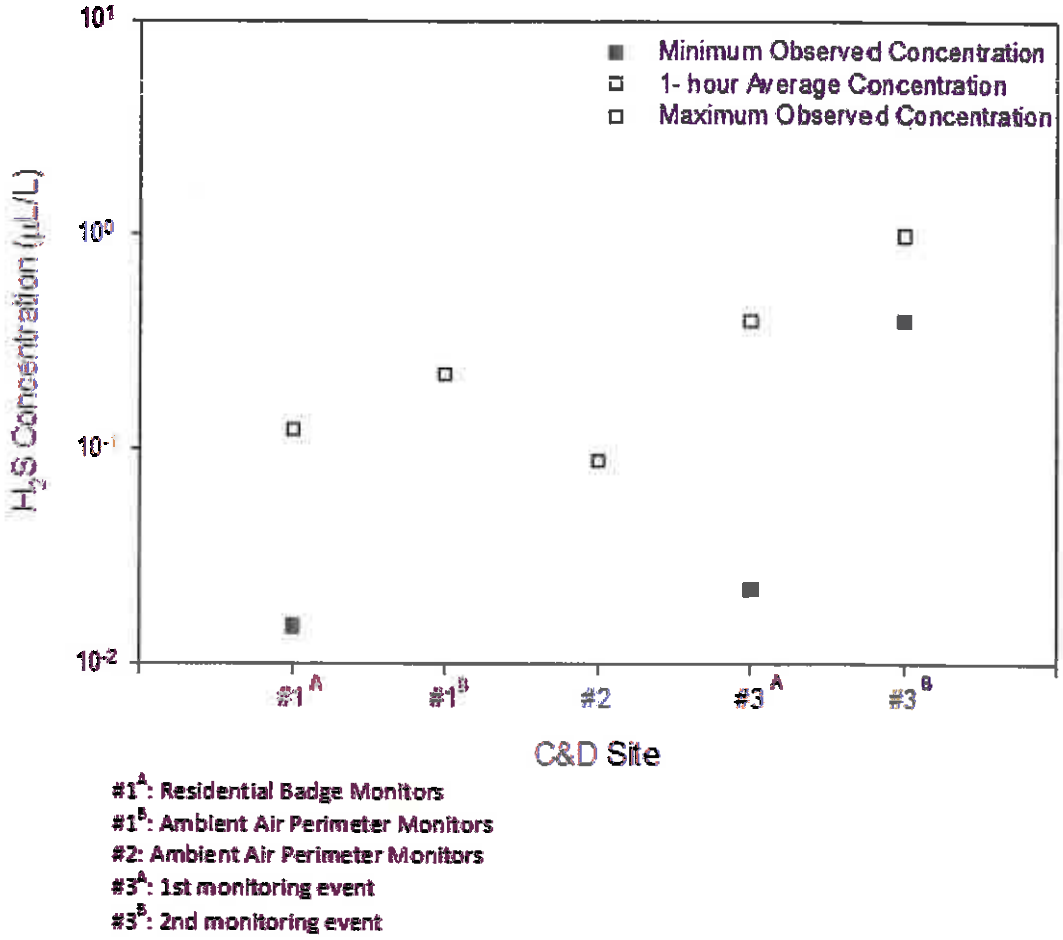

Figure 2-7. Compilation of Ambient Air H_2S Measurements Near C&D Landfills (#1: ATSDR (2007), #2: Tetra Tech (2004), and #3: Cooper et al. (2011))

Summary

The results show that measured concentrations within C&D landfills, and in some cases at the landfill surface, are high enough to fall within the range where acute exposure symptoms may occur. Data from the measurements in the waste mass or collected LFG showed H_2S concentrations above the level that could cause death in a short-term exposure scenario. Thus, operators at C&D debris landfills that accept gypsum drywall should be made aware of the potentially high concentrations of H_2S that may be encountered.

The measured landfill surface H_2S concentrations in the studies evaluated were somewhat variable, but several cases indicated concentrations that may be of concern. For example, one site reported an H_2S concentration measured by a personal badge worn by a landfill worker during the work day of greater than 100 µL/L, which exceeds the Occupational Safety and Health Administration's Immediately Dangerous to Life and Health level of 100 µL/L (refer to ***Appendix A*** for details on additional H_2S guidance and standards). In the 10-landfill study conducted by Lee et al. (2006), the mean surface H_2S

concentration was less than 10 µL/L for each site, but two sites had measured concentrations greater than the 10-minute AEGL-1 (which corresponds to nuisance and irritation in a short-term exposure scenario) and five of the sites examined by Lee et al. (2006) had a measured concentration that exceeded the ATSDR's acute maximum risk level.

The H_2S concentrations reported in ambient air near three C&D landfills (two of which were sites that had reported H_2S emission problems) indicate that the potential exists for the detection of H_2S concentrations above nuisance odor thresholds at or beyond the landfill property boundary, but the results varied and demonstrated that the presence of problematic or nuisance-level H_2S concentrations is not necessarily constant. The effect that H_2S source concentration at the landfill on the migration of H_2S off-site can be dramatic, as demonstrated by Cooper et al. (2011), which underscores the importance of mitigating H_2S at the landfill site.

2.7 H_2S at MSW Landfills

2.7.1 Factors Contributing to H_2S Formation and Emission at MSW Landfills

The conditions that cause H_2S formation in MSW landfills are similar to C&D landfills, in that a SO_4^{2-} source, carbon source, anaerobic conditions, moisture, and appropriate pH and temperature must be present. Gypsum drywall may be disposed of in MSW landfills through bulk C&D disposal, processed C&D disposal, or the use of C&D fines (also referred to as RSM) for initial cover or for grading and shaping of side slopes.

The presence of gypsum drywall in MSW landfills is a large contributor to H_2S formation at these sites. Fairweather and Barlaz (1998) conducted laboratory experiments comparing SO_4^{2-} reduction in reactors containing fresh MSW with and without gypsum drywall. The results indicated that the reduction of SO_4^{2-} to H_2S occurred concurrently with the production of methane (CH_4) from the MSW, and the reactors containing gypsum drywall produced sulfur emissions that were 10 times greater compared to the reactors without added gypsum drywall.

In contrast to C&D landfills, MSW landfills are required per federal regulations (40 CFR Part 258) to apply a soil cover (or equivalent) at least daily to control moisture and reduce odors and disease vectors. Thus, the presence of a daily cover is expected to reduce the infiltration of stormwater relative to a C&D landfill that does not have a soil cover requirement; however, it is expected that the higher moisture content inherent in MSW supplies enough moisture to contribute to H_2S production.

Several factors exist at MSW landfills that may contribute to the production or emission of H_2S beyond the basic conditions that must be met for H_2S to form. These factors are presented in ***Table 2-7***.

Table 2-7. Conditions That May Promote H_2S Production at MSW Landfills

Condition or Factor	Discussion
SO_4^{2-} Source	Larger sources of SO_4^{2-} from gypsum drywall may be present, in addition to other potential sources such as sludges. The amount of the SO_4^{2-} is a function of the amount of SO_4^{2-}-containing wastes accepted by the facility, which can vary widely. For example, a statewide characterization of waste at disposal facilities in Georgia indicated a weighted average of approximately 12% C&D debris (out of the total waste disposed in MSW landfills in the state), with a range of 0 % to 50% (Georgia Department of Community Affairs, 2005).
Waste Moisture Content	The nature of MSW differs from C&D debris in several ways, including the inherent moisture content of the waste as delivered to the disposal facility. Reported weight-based moisture contents range from 15% to 40% (Tchobanoglous et al., 1993), although multiple investigators have shown amounts beyond this range (e.g., 46% [El-Fadel, 1999]).
LFG Production Rate	The content of highly and moderately degradable organic waste normally found in MSW landfills results in the production of large volumes of LFG (particularly relative to C&D landfills), which may lead to greater transport of H_2S into LFG collection systems or through the landfill surface.
RSM Use in Cover Soil	MSW landfills have more stringent cover application requirements compared to C&D landfills, and as a result several MSW landfills have evaluated sources of material to use as cover, including RSM. Several states (e.g., Massachusetts) have C&D recycling mandates, thus the expansion in availability of RSM has led to an increase in the delivery of this material to facilities that beneficially use (as an alternative daily cover [ADC]) or dispose of the RSM. Several states have granted approvals for using RSM as an ADC. The presence of fine gypsum particles in RSM, which can be dramatic (Musson et al. (2008) measured the gypsum content of RSM from several facilities in the U.S. and the results ranged from 1% to 25% by weight gypsum) can lead to the production of H_2S.
Leachate Recirculation	Leachate recirculation is a common practice at MSW landfills. This process attempts to raise the moisture content of MSW in order to promote decomposition of the waste. Subsequently, gas production is increased, thus increasing the production of H_2S.

2.7.2 H_2S Concentrations at MSW Landfills

H_2S Measured in MSW LFG

H_2S in MSW LFG can pose additional issues beyond potential worker health and safety and nuisance conditions—specifically, sites that have active gas collection and control systems (GCCS) may be at risk of triggering emission thresholds for sulfur oxides (SO_x) if mass flow rates of H_2S are high enough (H_2S is converted into SO_x following combustion in typical LFG destruction devices). SO_2 is one of the six priority pollutants that are subject to the National Ambient Air Quality Standards (U.S. EPA, 2012a).

Landfills with Title V air permits and/or stationary source permits typically have an upper allowable limit of SO_2 emissions. Additionally, high H_2S concentrations can be problematic at MSW landfills that collect and beneficially use LFG to produce energy because a performance standard related to H_2S concentrations must usually be met (these performance standards vary depending on the type of energy conversion system, as discussed in Section 3.2.5); the requirement to reduce H_2S concentrations to meet these levels represents a cost that can impact energy project economics.

U.S. EPA (1998b) reported a default H_2S concentration of 35.5 µL/L for MSW LFG in the compilation of air pollutant emission factors (AP-42), which was developed based on the average of 37 test reports analyzed. The AP-42 develops emission factors, which facilitate the estimation of emissions from various sources of air pollution. The emission factors are typically averages of available data of acceptable quality. In recent years, U.S. EPA (2008) began to update the AP-42 default concentrations based on more recent measurements, and a draft background document presented updated H_2S monitoring data collected from active GCCS. ***Table 2-8*** presents summary statistics of the H_2S concentrations reported in U.S. EPA (2008). Note that the majority of data points were collected from MSW landfills in California.

Table 2-8. Summary of H_2S Concentration Data in MSW LFG Reported in the Draft Compilation of Air Pollutant Emission Factors for MSW Landfills (U.S. EPA, 2008)

Metric	Value (µL/L)
Minimum Concentration	0.001
Maximum Concentration	330
Mean Concentration	32.0
Standard Deviation	55.7
95% Upper Confidence Level	18.2

H_2S was measured in the field from active GCCS wells at an MSW landfill in Virginia that had been the subject of odor complaints. The results showed that approximately 15% of wells (approximately 22 out of 129) exhibited an H_2S concentration greater than 2,000 µL/L (Tennant, 2012). Note that these concentrations were measured prior to a destruction device. The U.S. EPA (2007) conducted a study of five MSW landfills (two in the Northeast and three in the Midwest) with active GCCS. LFG samples were collected from the GCCS from a main header pipe (which represents the cumulative volume of LFG collected from each site). The results of the sampling events are presented in ***Table 2-9***.

Table 2-9. Reported H_2S Measurement Data From Five MSW Landfills (U.S. EPA, 2007)

Landfill	Range of H_2S Measured in Raw LFG (µL/L)	Average H_2S Concentration in Raw LFG (µL/L)
A	7.6 – 18.4	13.0
B	18.7 – 25.6	22.9
C	19.0 – 78.0	55.5
D	22.7 – 132	72.7
E	291 – 366[A]	322[A]

[A]: Estimated Value

Capenter and Bidwell (1996) reported an H_2S concentration (determined by a chemiluminescence detector) in MSW LFG of 28.33 µL/L from a 60-acre landfill in Connecticut from a GCCS header pipe.

A regional MSW landfill in New Jersey accepted C&D screenings from 1998 to 2004 for use as an ADC (Carlton et al., 2005). The site began to receive odor complaints in 2002 (and reportedly had not received any odor complaints prior to this time) and an active GCCS was installed in early 2003 and expanded in

early 2004. LFG sampling in 2004 revealed H_2S concentrations up to 11,600 µL/L. Prior to acceptance of C&D screenings, a target SO_4^{2-} level in the screenings was established at 3% (by weight). Monthly testing reportedly indicated the target SO_4^{2-} level was met (Carlton et al., 2005). ***Figure 2-8*** presents a summary of reported H_2S measurements in MSW LFG presented by U.S. EPA (1998b), Tennant (2012), U.S. EPA (2007), Capenter and Bidwell (1996), and Carlton et al. (2005).

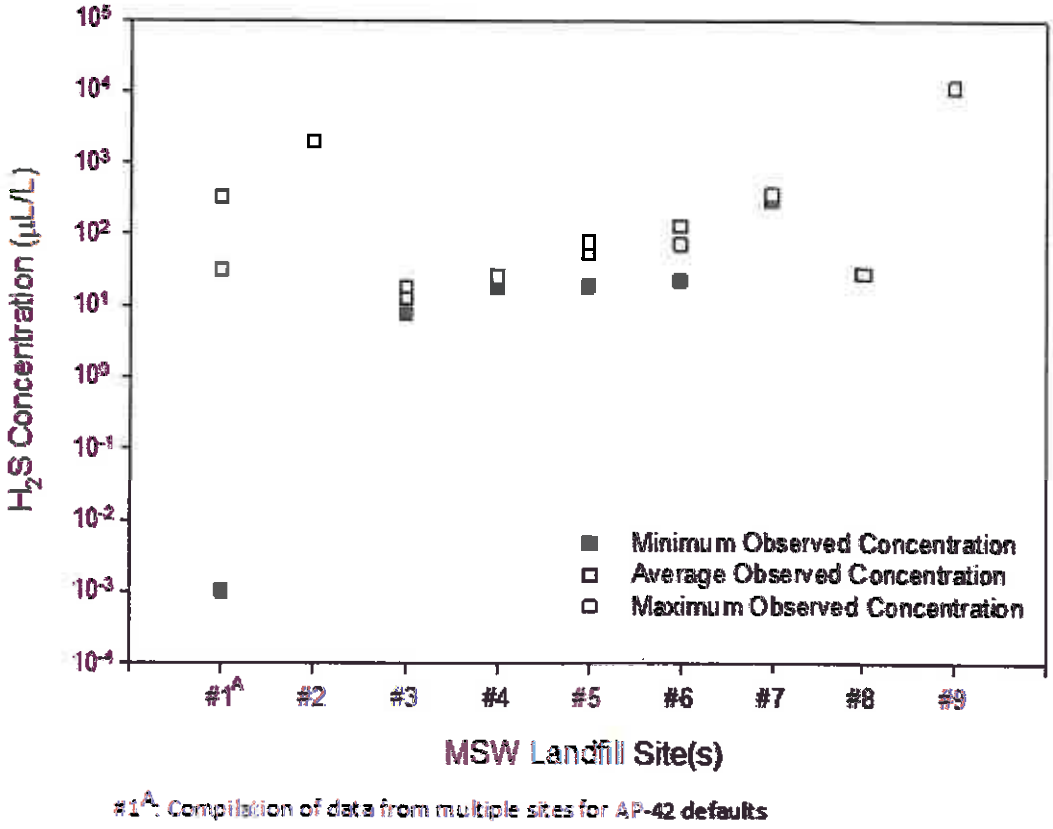

Figure 2-8. H_2S Concentrations Measured in LFG at MSW Landfills (#1: U.S. EPA (1998b), #2: Tennant (2012), #3 – 7: U.S. EPA (2007), #8: Capenter and Bidwell (1996), and #9: Carlton et al. (2005))

Anderson et al. (2010) conducted a study to estimate the H_2S production potential and kinetics based on the acceptance of C&D screenings at MSW landfills using SO_4^{2-} content measurement data from the C&D screenings and field-measured H_2S concentrations. The range of field-measured H_2S concentrations was from approximately 100 µL/L to 14,000 µL/L. Models were developed to predict H_2S production amounts based on data collected from six different landfills. The average production potential was calculated to be 4,310 ft^3 of H_2S per ton of sulfur in C&D fines. Anderson et al. (2010) also suggested that H_2S from the production of C&D screenings in MSW is expected to peak and decline more rapidly compared to CH_4 production.

The data provided in this section indicate that the concentrations of H_2S that can be formed in MSW landfills can be significant and comparable to levels measured in C&D landfills.

H_2S Concentrations Measured on the Surface of MSW Landfills

Gowing (2001) measured the flux of several gases, including H_2S through the landfill surface using a flux chamber at an MSW landfill in Waterloo, Canada. A total of 20 sampling locations that consisted of a 30-cm thick interim cover comprised of clay. The landfill site had an active GCCS in place on the side slopes, and measurements were taken in areas that were and were not under the influence of the GCCS. The results ranged from below the detection limit to approximately 7.7 µL/L. Measurements in the areas of highest H_2S flux ranged from approximately 4.2 µL/L to 7.7 µL/L.

Capenter and Bidwell (1996) measured ambient air samples 10 to 13 cm above the landfill surface, collected in a grid pattern, at a regional MSW landfill in Connecticut that had been subject to offsite odor complaints. At the time of the study, an active GCCS and enclosed flare had been operational for 2 years and intermediate or daily cover soil was in place at the site. Five grids on the landfill surface encompassing 4,650 m^2 were sampled over 9 days in locations considered to be "worst-case scenario" (e.g., odors noted previously, visible leachate or residue). H_2S in ambient surface air was measured to be 0.00095 µL/L. As a point of reference, the measured concentration of H_2S during the study collected from an active GCCS header was approximately 27 µL/L.

Ambient H_2S Concentrations Measured Near MSW Landfills

An ATSDR (2009) public health assessment of an MSW landfill in New York found offsite migration of H_2S resulting from poor operational practices exceeding 1 µL/L (daily maximum levels exceeding 3 µL/L) at the landfill perimeter for a period of 2 months (December 1990 and January 1991) before control measures were put in place and concentrations decreased to approximately 0.5 µL/L in downwind samples.

An MSW landfill that also included a C&D landfill in Ohio accepted a large amount of size-reduced C&D debris that resulted in odor problems (Ohio Environmental Protection Agency [OEPA], 2006). Roving monitoring data near the perimeter of the facility in 2005 exhibited 1-hour average H_2S concentrations ranging from 0.031 µL/L to 0.078 µL/L. During the same time frame, a 24-hour average of 0.011 µL/L was measured.

As part of an effort to address H_2S odors emanating from an MSW landfill in Illinois, which was attributed to the acceptance of pulverized C&D debris, a year-long monitoring effort was conducted to establish ambient H_2S concentrations around the site perimeter and define fluctuations in concentration that could be related back to weather data and landfill operations by the Lake County Health Department and Community Health Center (LCHDCHC; 2011a, 2011b). Three high-sensitivity, Honeywell low-level H_2S single-point monitors were installed around the perimeter of the site (one at a location upwind [#1] and two located downwind [#2 and #3]) from April 2010 through March 2011; the monitors had a lower detection limit of 1 nL/L (0.001 µL/L) and an upper detection limit of 90 nL/L (0.09 µL/L).

The monitoring results showed that a measured H_2S concentration greater than 0.005 µL/L was observed at monitor #2 at least once on 82 different days, whereas monitor #1 and #3 had a measured concentration exceeding 0.005 µL/L on 28 and 21 different days, respectively. Measured H_2S concentrations of greater than 0.09 µL/L were observed once at monitor #1 and #3 and on seven different days at monitor #2. The location of monitor #2 was most proximate to an area of the landfill where pulverized C&D was disposed. In general, peaks in H_2S concentration occurred during the late evening and early morning hours, when wind activity was minimal.

Heaney et al. (2011) evaluated H_2S concentrations measured between an MSW landfill and a neighboring community that was located within 0.75 miles of the site. Measurements using two different fixed H_2S monitors were conducted. One monitor conducted measurements at 15-minute intervals for 47 days, and one analyzer conducted measurements at 5-minute intervals for 58 days. The H_2S 1-hour average concentration during the study period was 0.00022 µL/L, with a range of below detection limit to 0.0023 µL/L. The H_2S monitoring results were compared with reports from nearby residents that maintained a

log of observed odor. The results were mixed to some degree in that resident observations of odor did not always correlate with an observed detection of H_2S. For example, 76% of reported "no odor" observations corresponded with H_2S detections less than 1 nL/L, and 72% of reported "no odor" observations corresponded with H_2S detections greater than 1 nL/L. Conversely, 8% of "strong" odor observations by residents corresponded to instances of H_2S less than 1 nL/L, but 6% of "strong" odor observations corresponded to instances of H_2S greater than 1 nL/L. The results of the study underscore some of the challenges associated with correlating a subjective observation (i.e., the presence of odor) with quantitative measurement data. ***Figure 2-9*** presents a summary of ambient concentrations reported by OEPA (2006), ATSDR (2009), and Heaney et al. (2011).

Figure 2-9. Ambient, Perimeter, and Offsite Measured or Modeled Concentrations of H_2S at MSW Landfills (#1: OEPA, 2006' #2: ATSDR, 2009; and #3: Heaney et al., 2011)

Summary of H_2S Measured at MSW Landfills

The H_2S measurement data from LFG at MSW landfills suggest that high concentrations of H_2S may be produced at levels comparable to that measured within C&D landfills. In many of the cases presented, the measurements were taken from a GCCS (either individual collection wells or header pipes). The results indicate the importance of routine monitoring of H_2S for systems that have active GCCS, particularly larger sites that may accept gypsum drywall or RSM, as potentially high H_2S concentrations may impact LFG to energy systems and in some cases could have implications on SO_x limits in a landfill's Title V permit.

The results of landfill surface concentration sampling of H_2S were somewhat variable, with one case indicating low measured concentrations that were generally less than the nuisance level for H_2S presented by Amoore (1985) and comparable to U.S. EPA (2010a) reported atmospheric concentrations of H_2S. Another case indicated measured concentrations greater than 1 µL/L, exceeding irritation levels summarized by WHO (2003), and some of the exposure guideline levels presented in ***Appendix A***. The results indicate different factors such as operation of a GCCS, cover soil type and quality, and H_2S source concentration can have an impact on measured concentrations at the landfill surface.

Ambient H_2S concentration data, similar to surface concentration measurements, were variable. Data from the sites in Ohio and Illinois both indicated ambient concentrations beyond the landfill footprint greater than the H_2S nuisance level of 0.015 µL/L reported by Cooper et al. (2011), and in the case of Ohio, measured concentrations exceeded the acute minimum risk level of 0.07 µL/L established by ATSDR. Conversely, monitoring data near a landfill in North Carolina indicated H_2S concentrations below nuisance levels and most of the reported human odor detection limits as well. Regardless of the low H_2S levels, the evaluation by Heaney et al. (2011) concluded that observations and log books maintained by nearby residents during the study still indicated effects such as irritation and behavioral changes.

2.8 Considerations for Other Reduced Sulfur Compounds

Although H_2S is the most-studied RSC with respect to landfill emissions, other RSCs have been investigated in LFG; most are malodorous, with low odor thresholds, and considered undesirable contaminants in LFG (Moreau-Le Golvan, 2003). Other RSCs that may be detected in LFG include methyl mercaptan (CH_3SH), isopropyl mercaptan (C_3H_8S), isobutyl mercaptan ($C_4H_{10}S$), dimethyl sulfur ($(CH_3)_2S$), dimethyl disulfide ($(CH_3)_2S_2$), dimethyl trisulfide ($(CH_3)_2S_3$), carbonyl sulfide (COS), carbon disulfide (CS_2), and tert-butyl mercaptan ($CH_4H_{10}S$). These compounds generally are malodorous, and some have odor thresholds at similar concentrations to H_2S. Christensen et al. (1996) reports that RSCs such as mercaptans are formed from highly degradable materials and are usually only found during the initial operational phase of the landfill, whereas H_2S is normally generated in all phases of a landfill's life.

As with H_2S, the odor detection threshold of other RSCs occurs at different concentrations based on the individual. ATSDR (n.d.) reports odor thresholds for CH_3SH of 0.002 µL/L, Cameo Chemicals (1999) reports 0.00025 µL/L as an odor threshold for C_3H_8S, and ATSDR (2011) reports CS_2 can be detected by most humans from 0.02 to 0.1 µL/L. $C_4H_{10}S$ has a reported odor threshold of <0.001 µL/L (Chevron Phillips, n.d.). $(CH_3)_2S$ has an odor threshold of approximately 0.001 µL/L (Bayou Engineering, 2004); $(CH_3)_2S_2$ has an odor threshold of 0.008 µL/L (Bayou Engineering, 2007).

U.S. EPA (2008) reported uncontrolled LFG data on several RSCs, in addition to H_2S. ***Table 2-10*** summarizes the data from U.S. EPA (2008) for several RSCs. Samples of LFG were collected from MSW landfills, and the sample collection point was from the main GCCS header pipe.

Table 2-10. Summary of Measured RSC Concentrations From MSW LFG (U.S. EPA, 2008)

Compound	Minimum (µL/L)	Maximum (µL/L)	Mean (µL/L)	Standard Deviation (µL/L)
CH_3SH	9.8×10^{-4}	4.05	1.37	0.955
C_3H_8S	3.75×10^{-5}	1.22	0.175	0.26
COS	1.04×10^{-4}	0.275	0.122	7.12×10^{-2}
CS_2	2.92×10^{-4}	0.353	0.147	8.74×10^{-2}
$(CH_3)_2S$	7.51×10^{-3}	14.7	5.66	0.383
$(CH_3)_2S_2$	2.29×10^{-4}	0.435	0.137	0.103

Lee et al. (2006) measured RSCs at 10 C&D landfill sites in Florida. Samples were collected above the landfill surface, and from gas collection pipes and subsurface vapor probes. H_2S was typically found in significantly greater concentrations than the other RSCs. However, at one site where samples were drawn from LFG wells, concentrations of COS (22 µL/L) and CH_3SH (85 µL/L) exceeded that of H_2S (average of 5.9 µL/L).

While the presence of all RSCs can create potential odor and operational issues (with respect to gas collection and energy utilization) at landfills, the relative and persistent dominance of H_2S indicates that in most cases the measurement of H_2S will likely provide appropriate information to site operators regarding the presence and magnitude of potential odor or other issues related to RSCs at a landfill.

3. Methods to Prevent and Control H_2S Emissions

Knowledge of the factors that contribute to H_2S formation is essential to preventing its formation, and strategies to actively reduce emitted H_2S concentrations are detailed in this section. Formation of H_2S in landfills may not be avoidable due to varying constraints; thus it is critical to discuss strategies to control H_2S emissions once the gas is formed. There are several strategies to prevent and control H_2S that have been explored at the research level and in practical application. Given the differences in site characteristics and regulatory schemes that landfill sites may be subject to, an integrated approach that employs one or more of the strategies in this section, coupled with effective site-specific BMPs, may yield effective results.

3.1 Methods to Prevent H_2S Formation

3.1.1 Diversion of Drywall and Limiting SO_4^{2-} Content of RSM

The diversion of drywall from disposal has been recommended as a measure to prevent H_2S formation in landfills (CalRecycle, 2007; FDEP, 2011). In some cases, landfills have instituted bans on the disposal of drywall except for small amounts. For example, a landfill in Vancouver, Canada is subject to a bylaw created by the Greater Vancouver Sewerage and Drainage District Act (GVSDDA) of 2012, which states, in part:

> *No person shall dispose of any Gypsum at a Disposal Site: (a) except at a Recycling Area designated for Gypsum; and (b) unless the Load of Gypsum weighs one-half (1/2) tonne or less.*

Metro Vancouver uses two elements in addition to the disposal ban to facilitate compliance and appropriate management of gypsum drywall. First, an economic disincentive for delivering gypsum drywall to the landfill was established. Generators that bring prohibited gypsum drywall to the landfill are assessed a minimum surcharge of $50, plus the cost of removal, cleanup, or remediation. Loads that contain banned materials are assessed a 50% tipping fee surcharge. Second, Metro Vancouver provides generators with information on a drywall recycling facility where scrap drywall can be delivered (provided the material does not contain asbestos) (Metro Vancouver, 2012).

A variety of recycling markets have been developed for gypsum drywall, including for purposes such as agricultural soil amendments and manufacture of new drywall, so the increase in the diversion of drywall for recycling would be expected to reduce the amount of drywall that is deposited into landfills. As with any recycled product, the ability to effectively recycle a waste component depends on market demand, the cost of virgin materials or materials being replaced by the recycled product, disposal costs, transport costs, and other factors.

Another practice that may reduce H_2S emissions at disposal facilities that accept RSM is to limit the SO_4^{2-} content of the RSM delivered to the facility. Musson et al. (2008) developed a method to establish SO_4^{2-} content in RSM, which can be used by C&D recyclers to track performance related to gypsum drywall removal and provides receiving facilities with important data to understand the SO_4^{2-} content (and

therefore potential to produce H_2S) in RSM that is accepted. In some states (e.g., Massachusetts and New Hampshire), the removal of gypsum drywall at the front end of the C&D recycling process is required where feasible. Landfills may also develop specifications for RSM that include sampling procedures and sampling personnel training requirements, and chemical limits of the RSM, which may include SO_4^{2-}.

While the practice of separating drywall and limiting the SO_4^{2-} content of RSM produced by C&D recycling facilities should decrease the amount of reducible sulfur entering a landfill, the specification of maximum SO_4^{2-} limits at a landfill that uses RSM may not necessarily prevent all H_2S emission problems. For example, Carlton et al. (2005) reported that an MSW landfill that accepted C&D fines specified and routinely met a SO_4^{2-} limit of 3%, but odor problems at the facility persisted anyway. Another consideration for operators that specify SO_4^{2-} limits in RSM is that the results can be somewhat variable between C&D recyclers and even at the same recycling facility. For instance, Anderson et al. (2010) summarized SO_4^{2-} content data from eight C&D recyclers in Massachusetts and found the mean SO_4^{2-} content of C&D fines to range from 1.6% to 8.7%. Data presented by Anderson et al. (2010) for one C&D recycling facility over a 2-year sampling period showed a SO_4^{2-} content range from approximately 0% to 15%. Anderson et al. (2010) also noted data from a landfill that monofilled C&D fines and layered the fines with material to reduce odors, which suggested some effectiveness, but further study was needed to more closely evaluate this technique.

3.1.2 Moisture Control

Minimization of moisture contact with gypsum-containing waste is a key to minimizing H_2S generation; thus, practices to reduce the infiltration of moisture into the waste are expected to reduce the production and emissions of H_2S – note that many of these practices can help to reduce the emission of other gases that are not in the form of a reduced sulfur compound. These practices, which are summarized in ***Table 3-1***, are expected to apply to both C&D and MSW landfills. It is noted that some of the practices (such as minimizing the size of the working face) are more commonly required in MSW landfill permits.

Table 3-1. Summary of and Discussion of Moisture Control and Cover Soil Use Techniques to Minimize the Production and Emissions of H_2S

Landfilling Practice	Discussion
Minimizing the Landfill Working Face	Reducing the size of the working face reduces the potential for surface water to contact and percolate through the waste mass. A smaller working face also reduces the amount of cover soil needed, thus the quantity of soil needed would be less, which would be a benefit at sites that use RSM as daily cover. A smaller working face would also reduce the area of waste open to the atmosphere, which would be expected to reduce odorous gas emissions compared to a facility with a larger working face.
Working Face Grading	Grading the active face for drainage helps to avoid ponding of water on the landfill surface and thus encourages runoff.
Landfill Phasing	The use of intermediate cover, particularly on side slopes as a landfill is built up, would be expected to encourage surface water runoff and reduce the amount of moisture that infiltrates into the waste mass.
Using Daily or Weekly Cover	Many states do not have a regulatory minimum requirement to apply cover soil at C&D landfills. The use of cover soil can help reduce the migration of liquid into and through the waste, and can act as a barrier and removal mechanism for H_2S, depending on the cover material used. Soil has the potential to absorb released H_2S that passes through the cover,

(continued)

Table 3-1. Summary of and Discussion of Moisture Control and Cover Soil Use Techniques to Minimize the Production and Emissions of H_2S (continued)

Landfilling Practice	Discussion
Disposal Practices with Drywall	Instituting unique practices at landfills that accept gypsum drywall may help to mitigate issues that can occur when the materials are exposed to moisture. Options may include: • Placing loads of material containing drywall in areas of the active landfill face that are at a higher elevation, which would decrease the potential of moisture contact compared with placement in a low-lying area on the active face. • Immediately placing additional waste or a cover (e.g., temporary tarp or soil cover) on top of newly-placed loads that contain gypsum drywall to reduce the likelihood of contact with stormwater. • Segregating received drywall to distinct areas and perhaps making note in operations records of areas where larger amounts of drywall were placed (similar to how landfills that accept asbestos make note of incoming quantities and disposal location). This practice would be expected to consolidate locations where H_2S may be formed and facilitate future H_2S mitigation, if needed.
Run-On and Run-Off Controls for Stormwater	The use of run-on controls will prevent stormwater from encroaching onto or into the landfill, while run-off controls help to divert stormwater to appropriate stormwater management areas.
Use and Proper Operation of Leachate Removal and Treatment Systems	Leachate build-up on the bottom of landfills can occur if there is naturally-occurring low permeability material beneath the waste, and can occur with an improperly functioning leachate collection system. As an example of the impact that liquid levels can have on H_2S production, Bergersen and Haarstad (2008) observed in the laboratory an approximately 8-fold difference in H_2S off-gassing from effluent from submerged MSW mixtures containing crushed gypsum board compared to MSW mixtures with crushed gypsum board with a low water content.

3.1.3 Bacterial Inhibition

The use of bacterial inhibitors to reduce the proliferation of SRBs has been evaluated at the laboratory scale. Isa and Anderson (2005) evaluated the use of molybdate (MoO_4^{2-}) as an SRB inhibitor in a continuous feed anaerobic digestion process. The findings showed that SRB and CH_4-producing bacteria were inhibited; thus, such a solution may not be appropriate for MSW landfills that are recovering LFG for energy. Xu et al. (2011) evaluated the use of different chemical inhibitors at the laboratory scale, including sodium molybdate on the production of H_2S from gypsum drywall. The results showed that a three orders of magnitude decrease in H_2S concentration was observed when the inhibitor was used, which was attributed to the development of pH conditions unfavorable to biological growth. Overall, the use of bacterial inhibitors has not been examined on a field scale and further evaluation is needed to assess the effectiveness of a bacterial inhibitor on H_2S production and potential environmental impacts (such as resultant leachate concentrations and subsequent potential impact to groundwater).

3.2 Methods to Control H_2S Emission

3.2.1 Leachate Management

Once leachate is generated in a landfill, it is either collected in a leachate drainage system or infiltrates into the groundwater (in the case of unlined landfills). H_2S contained in leachate volatilizes in accordance with Henry's law due to new concentration and pressure gradients outside of the landfill. Profumo et al. (1992) demonstrated that leachate can be a significant source of H_2S. Thus, the identification and control of leachate (e.g., seeps at side slopes, at the landfill surface, or at the toe of the landfill) may help to limit exposure of raw leachate to the atmosphere and thus reduce the potential for H_2S to volatilize into the atmosphere. An additional consideration is acknowledging the potential hazardous atmospheres that can form in areas where leachate may accumulate, including gas wells, leachate sumps and cleanout lines, and tanks, and ensuring that landfill personnel are aware of these areas and the potential for H_2S to be present.

Oxidation of H_2S inside of leachate containment areas such as sumps can prevent the eventual off-gassing of H_2S; an oxidizing agent (e.g., hydrogen peroxide) oxidizes H_2S to elemental sulfur or SO_4^{2-}, depending on pH. Also, aerated leachate ponds (e.g., using floating aerators) are commonly used to lower BOD and COD levels in leachate, which can oxidize RSCs as well.

3.2.2 Cover Soil Amendments

Research regarding various landfill cover amendments to reduce H_2S through precipitation, adsorption, or oxidation has been conducted at the laboratory and field scale. Prior to consideration of a soil amendment, it should be noted that the use of natural soils has shown the ability to decrease the concentration gradient (one of the main driving forces behind H_2S emissions, as described in Section 2) and thus provide time for H_2S to be adsorbed or removed. For example, Xu et al. (2010) observed up to a 60% removal capacity of H_2S by natural soils in a set of field experiments in Florida.

In some cases, the use of natural soils may require supplementation to further enhance the removal or mitigation of H_2S. Below is a summary of cover soil amendments that have been used at the laboratory or field scale and shown to decrease H_2S emissions. Note that the effectiveness (short-term and long-term) depends on the amendment blend that is used and specific site characteristics such as source H_2S concentration, atmospheric characteristics, and landfill characteristics. The materials list provided in this section represents examples of amendments reported in the literature and is not intended to represent guidelines for design. Some of the amendments listed could potentially be used at landfills other than those that accept C&D debris and MSW (such as an industrial waste facility that accepts paper mill sludge); however, factors such as waste mass stability should be considered when applying cover amendments to industrial waste facilities. The selection and use of a cover soil amendment must be made with consideration of numerous factors, including economics, site permit conditions, and other relevant site characteristics.

- ***Ammonium nitrate fertilizer***. Sungthong (2010) and Sungthong and Reinhart (2011) evaluated the removal of H_2S at the lab scale by ammonium nitrate fertilizer, which proceeded under the autotrophic denitrification process. An analysis of an example 10-acre MSW landfill (modeled after an actual operating facility) using measured H_2S concentrations (which had H_2S concentrations in collected LFG ranging from 480 to 2,800 µL/L) suggested that the application of 157,000 kg of 34% nitrogen fertilizer could sufficiently remove the anticipated 15-year emission amount of 80,900 kg of H_2S.
- ***Coal ash***. CMRA (n.d.) reported that a mixture of 30% coal ash and 70% RSM helped to control H_2S emissions by an order of magnitude in a C&D cell. New Hampshire evaluated the use of a 50% coal ash and 50% RSM blend that indicated H_2S reduction (NHDES, 2004). In most cases, the use of coal ash would likely only be allowable at an MSW landfill because of restrictions on using/disposing ash in many C&D landfills based on a review of state regulations (U.S. EPA, 2012b).
- ***Compost/biocover soil***. Xu et al. (2010a) showed that a yard waste-derived compost in a field study at a C&D landfill attenuated H_2S more effectively than sandy soil. Materials similar to composted yard waste such as chipped waste wood or bark may also be effective. Bergersen and Haarstad (2008) used organic filter materials and observed H_2S removal capacities of 215 and 387 mg S/kg for spruce bark and wood chips, respectively.
- ***Concrete fines***. Plaza et al. (2007) showed that concrete fines (those smaller than 2.5 cm) reduced H_2S concentrations by 99% in a laboratory column study. At the field scale, Xu et al. (2010a) covered plots at a C&D debris landfill and observed a 90% reduction in H_2S levels, which was attributed to a pH shift caused by the high-pH concrete fines and adsorption of H_2S onto the fines.

- ***Fuller's earth***. This material is a clay-like substance that has been used as an absorbent in numerous applications (e.g., cat litter). Commercial products and patents have been developed that are Fuller's earth-based. Lab-scale test results presented in USPTO (2005) indicate approximately 0.2 mg of H_2S could be removed (to levels at a normal human odor threshold) per g of a blend comprised mostly of Fuller's earth, or approximately 65 to 75 tons per acre of landfill surface for a 2-cm thick layer.
- ***Lime***. Plaza et al. (2007) showed that lime-amended soil (5% by weight mixture) removed H_2S substantially in a laboratory column study. Xu et al. (2010a) conducted a field study that evaluated a 1% and 3% by weight lime-soil mixture on the surface of a C&D landfill. In both cases, the lime-amended soils were shown to attenuate H_2S, which was attributed to changing of pH conditions and physical removal. Sungthong (2010) calculated that approximately 176,000 kg of hydrated lime would be needed to create a 1% (wt) blend with a 2-ft thick cover soil to attenuate expected H_2S emissions from an example 10-acre landfill (described in the ammonium nitrate fertilizer section above) with a 15-year H_2S emissions amount of 80,900 kg.
- ***Steel tire shreds***. Anunsen (2007) showed that M1 steel from a tire shredder placed near passive LFG vents at an MSW landfill showed the attenuation of H_2S over a range of flow rates. Xu et al. (2010b) showed substantial attenuation of H_2S (from 100 µL/L to 1 µL/L) using tire-derived steel in a simulated landfill cover.
- ***Metallic filter materials***. Metallic filter materials removed H_2S (600–1,200 µL/L) in laboratory experiments where H_2S was generated from submerged waste materials with and without gypsum drywall in column reactors (Bergersen and Haarstad, 2008). Iron oxide, iron-rich sewage sludge compost, and a 3:1 mixture of bottom ash and iron oxide removed 983 mg S/kg, 762 mg S/kg, and 3,345 mg S/kg, respectively.

3.2.3 Capping Systems

Capping a landfill with a low-permeability layer can help to remediate H_2S emission by both curbing production and preventing emissions from entering the atmosphere. Landfill capping systems limit or prevent infiltration of stormwater (and thus the production of leachate) into the waste. Once H_2S has been generated in a landfill, the cap systems provide a barrier to uncontrolled venting of LFG. The use of a capping system in combination with a GCCS minimizes escape of H_2S gas. The deployment of capping systems in combination with an active GCCS has been recommended as a BMP for H_2S control at both MSW and C&D landfills (Waste Management, 2005; Massachusetts DEP, 2007). Capping systems are often part of a final or intermediate cover at landfills, and both will be discussed in this section. Discussion regarding the integration of a capping system with an active GCCS is presented in Section 3.2.5.

Intermediate cover is intended to provide a greater barrier between the waste and the atmosphere than daily cover and in addition provide cover to an area that will not to be filled over for an extended period of time and may need to be driven over in order to fill the landfill sequentially. While daily cover typically consists of a six-inch layer of soil (or approved equivalent), intermediate cover is typically thicker (e.g., 1 ft) and is normally compacted to allow ease of access. Thus, intermediate cover with a greater thickness than a typical daily cover is expected to provide the benefits described in Section 3.2.2 for soil covers, but also potentially facilitate LFG collection as well. Temporary membranes (synthetic materials) can also be utilized as an intermediate cap prior to the installation of a final permitted capping system. In cases where intermediate covers cannot be constructed at a slope to allow for positive drainage, supplemental piping and drainage infrastructure may be needed to prevent ponding of stormwater on the landfill surface.

The components of final cover systems vary depending on the type of landfill and the specific conditions of a disposal facility's permit. Low-permeability final cover normally consists of the following layers (from top to bottom): soil layer capable of supporting vegetation, drainage layer (e.g., geonet overlain by geotextile to prevent clogging), barrier layer, grading layer (this is sometimes overlain by a high-permeability layer, such as coarse sand, to allow the transmission of LFG to collection points). The barrier layer can consist of either synthetic (e.g., HDPE) or natural materials (e.g., low-permeability compacted clay). For facilities that do not require a low-permeability final cover, the final cover configuration typically consists of (from top to bottom) a soil layer capable of supporting vegetation and a soil layer to provide a buffer distance between the top of the final cover and the top of the waste mass (e.g., 2-ft thick).

At facilities where H_2S emissions are problematic, the installation of final cover as soon as final waste filling grades are reached can aid in controlling H_2S when coupled with some form of LFG controls. This practice may or may not be accelerated based on permit requirements, and the decision to deploy a final cap earlier than a facility's permit requires may be necessary for practically handling H_2S emission problems in some cases.

3.2.4 Odor Neutralizers

Odor neutralizers can be utilized to mask or mitigate odors from H_2S. Odor neutralizers are chemicals that react with H_2S to form a nonodorous compound, or may simply act to mask odors. Other odor-neutralizing agents work to encapsulate materials and thus block odors from escaping. Odor neutralizers are often misted in a spray, which is then applied at landfills to the working face, near the working face, or near or at the site perimeter, depending on where odor concerns are present.

Examples of chemicals that act as H_2S odor neutralizers include bleach, sodium bicarbonate, ammonium bicarbonate, magnesium bicarbonate, caustic soda, amines, and other proprietary chemicals. Neutralizers are often sold in concentrated form and are diluted upon deployment; in some cases, dilution ratios can be controlled, depending on the severity of odor issues or the area being managed.

Odor neutralizing chemicals in aqueous form can be applied via conventional agricultural sprayers, vapor diffusion systems that use heat to vaporize chemicals (essential oils) and then blow them through a perforated pipe, water trucks that employ spray bars and hoses for heavy working face product application, and fogging or industrial misting systems. Passive odor neutralizers (such as deodorizing sleeves that can be hung at different areas at a site) may be used as well, where a solid granule or powder neutralizes the odor.

In general, odor neutralizers are considered temporary measures as the products typically do not prevent the production of odorous compounds.

3.2.5 LFG Collection and Treatment

LFG collection involves the installation of collection devices (e.g., wells) into the waste to control the flow of LFG, although LFG controls may also include collectors located beyond the perimeter of the waste. LFG can be passively vented or actively controlled. No federal standards for active LFG control exist for C&D landfills, but federal standards (e.g., those found in the New Source Performance Standards for MSW Landfills, 40 CFR Part 63 Subpart WWW) mandate active gas controls once an MSW landfill reaches a certain size or emission rate of nonmethane organic compounds (NMOC). H_2S generated in landfills is considered a trace component of LFG, and the installation of an active GCCS solely to control H_2S is not very common because of the extensive design, permitting, and construction needs associated with an active GCCS.

Collected LFG can be vented to the atmosphere (and typically routed through treatment media or individual destruction devices), routed to a temporary or permanent flare station to combust the collected LFG, or utilized for energy production. Passive vents within the waste could be embedded within a

treatment medium as well (e.g., wood chips), which could provide an added opportunity to remove odor-causing compounds before the gas is vented to the atmosphere or routed for further treatment. Active GCCS systems use compressors or vacuums to create a pressure gradient to route LFG to a collection point. The number and spacing of collection wells depends on waste density, pressure gradients required, and LFG production expected (which depends on the composition of the waste). The U.S. EPA Landfill Methane Outreach Program reports that more than 500 MSW landfills have an LFG to energy project and more than 500 landfills are candidates for an energy project.

Active LFG control at C&D landfills may be complicated by the fact that substantial quantities of other gases such as CH_4 are not produced, which is a reflection of the types of waste normally deposited in C&D landfills (refer to Section 2.5 for discussion of waste composition at C&D landfills). In cases where active LFG controls are used at C&D landfills, supplemental fuel may be required to provide enough BTU content to combust the gas (e.g., an active GCCS at a landfill in New York used natural gas as a supplemental fuel (McCarron, 2007)). Solar spark flares have been used in cases where lower LFG flow rates or CH_4 concentrations are present (e.g., at C&D landfills, in areas of MSW landfills that do not yet require active control, or at areas of landfills where LFG may build up such as leachate lines).

As mentioned previously, high levels of H_2S in LFG can be problematic in LFG to energy projects—for example, Lopez (2012) indicates that the frequency of maintenance and engine overhauls at energy projects that convert collected LFG to electricity is greater when H_2S concentrations are greater because of wear and corrosion of engine parts. High H_2S concentrations in LFG may also void or limit manufacturer warranty (General Electric, 2009). Rasi et al. (2011) reported that a recommended maximum H_2S concentration for biogas (including LFG) used in boilers and internal combustion engines is 1,000 µL/L. GE Jenbacher recommends H_2S limits of 700 mg/10 kWh and 1,200 mg/10 kWh for LFG engines with and without catalytic converters, which equate to 245 µL/L and 419 µL/L, respectively (General Electric, 2009). In cases where LFG is cleaned up to remove CO_2 and other constituents for use as a vehicle fuel or for delivery to natural gas pipelines, H_2S concentrations of less than 4 µL/L are normally required (Wentworth, 2009).

Collected LFG with a high concentration of H_2S can result in the emission of SO_2 following combustion at a LFG destruction device. SO_2 is a primary pollutant subject to national ambient air quality standards in the United States, and Title V operating air permits at MSW landfills may have limits on the emissions of SO_2. In cases where high LFG collection rates and high concentrations of H_2S are present, the permit-specified SO_2 emission limits could be reached, thus potentially requiring the implementation of a system to reduce H_2S concentrations prior to combustion of the LFG. For example, a study at a large MSW landfill in Virginia estimated that the facility's Title V SO_2 emission limit of 240 tons per year could be exceeded with a LFG collection rate of 8,000 standard cubic feet per minute and an H_2S concentration of 770 µL/L (Tennant, 2012).

A variety of treatment technologies are available to reduce the concentration of H_2S in collected LFG. ***Table 3-2*** presents a summary of LFG treatment technologies specific to H_2S removal or reduction.

Table 3-2. Summary of Treatment Technologies to Reduce H_2S Concentrations in Collected LFG

Treatment Technology	Further Classification	Specific Chemicals, Mechanisms, Results
Liquid Treatment (Scrubbers to treat gas flow)	Alkaline Solutions	Caustic Soda (NaOH) • NaHS or Na_2S solid salts are formed (Siemak, 1985) Other hydroxides (KOH, KI) Carbonate Solutions (Na_2CO_3, $MgCO_3$)
Liquid Treatment (Scrubbers to treat gas flow)	Amine Solutions	Sulfaclear®, Almont 6,6B, 6F® Methyl Di-ethanol Amine (MDEA) (Pandey 2005)
	Nitrite Solutions	$3H_2S + NaNO_2 \rightarrow NH_3 + 3S + NaOH$
	Metal Solutions	Metal SO_4^{2-} Solutions • $CuSO_4$, $ZnSO_4$, $FeSO_4$ examined by ter Maat et al. (2005) in laboratory • Precipitates metal sulfide, metal carbonate, or metal hydroxide (pH dependent) • $CuSO_4$ purified biogas in a pilot scale project (85% removal of influent H_2S at 170 µL/L) SulFerox® • H_2S reacts with aqueous ferric iron, forms S^0
Solid Adsorption Treatment	Activated Carbon	Norit ROZ3® • Steam activated carbon, designed for H_2S and mercaptan removal • Can be diluted with less selective, less costly AC species (Norit RB4W) for similar H_2S removal (up to 70% dilution) (Mescia et al. 2011) • Field scale experiments showed H_2S (245 µL/L) removal to 1 µL/L; removal of 71.99 gH_2S/kg AC (30% ROZ3) (Mescia et al. 2011)
	Ash	MSW bottom ash • Removed H_2S (100 µL/L), CH_3SH (4 µL/L), and $(CH_3)_2S$ (30 µL/L) from field LFG; mass removals of 3 g, 44 mg, and 86 mg per kg ash, respectively. Contact time played a large role (Ducom et al. 2009).
	Metal Oxides/Catalysts	Iron sponges Produces metal sulfides • Pyrite (FeS_2), phalerite (ZnS), Molybdenite (MoS_2) SulfaTreat®
Chemical Process	Oxidizing Agents	Hydrogen Peroxide (H_2O_2) • Can form elemental sulfur or SO_4^{2-} (pH dependent)
Biological Processes	Sulfur Oxidation	ThioPaq® • Biologically mediated HS^- to elemental sulfur (S^0) after alkaline scrubbing • Regenerates caustic soda for reuse (Tennant 2012) Bio-Scrubber®

4. Site Investigation and Monitoring Techniques

4.1 Site Inspection Procedure Considerations

Site investigations may occur as part of routine operations or in response to an odor complaint. If odor complaints are received at a landfill, pertinent information about the complaint (e.g., location of complaint, time of day, weather conditions at the time of complaint, assessment of site conditions at the time of the complaint) should be recorded.

Multiple states have developed BMP or guidance for the evaluation of odor that may be emanating from a landfill and/or require that landfills maintain their own odor management plan to address odor. The practices from several BMP guides were evaluated and the key elements related to site inspection considerations for landfill personnel are summarized below.

- Identify any potential sources of odor from accepted wastes (e.g., dead animals, gypsum drywall (bulk or size-reduced), processing of yard waste, biosolids, other industrial wastes).
- If a GCCS is present, evaluate areas where elevated temperatures are present, as these may be areas of higher decomposition and potential areas of H_2S production and emissions.
- Perform site inspections during early morning or late evening, when odors are most likely to be observed.
- Use monitoring instruments that are properly calibrated to the range of H_2S concentrations expected, and use such equipment consistently with manufacturer specifications.
- Inspect and monitor for H_2S along the site perimeter, particularly paying attention to site topography as H_2S may settle in low-lying areas.
- Monitor for H_2S near and downwind of the working face.
- Record all measured H_2S concentrations and the locations where they were measured.
- Inspect for any leachate seeps or ponded leachate, document and address on- and off-site structures where leachate may migrate and emit H_2S gas, causing exposure to workers and nearby residents.
- Document information regarding weather conditions and area(s) of the site inspection, including (but not limited to):
  - Date and time
  - Weather conditions
    - Temperature
    - Wind speed and direction
    - Cloud cover
    - Ongoing or recent precipitation events
  - Name of person conducting inspection
  - Areas inspected (written description and/or map)
  - Locations or observations from other potential nearby sources of odor or H_2S (e.g., wastewater treatment plant)
- Maintain documented site inspection records on site.

Another important consideration related to site monitoring is awareness of confined spaces. Confined spaces are generally defined as areas with limited entry or exit that are not designed or intended for

continuous human occupancy. Confined spaces have the potential for hazardous atmospheres, including explosive gas concentrations, concentrations of gases that are toxic to humans, and low oxygen. Examples of confined spaces at C&D and/or MSW landfills include vaults, tanks, pipes, storage bins, sumps, and trenches.

Many landfills are required to have confined space entry plans intended to prevent someone from entering a toxic/oxygen-deficient environment with the potential for asphyxiation. These plans emphasize the buddy system, where if one is entering a confined space, another person stands by ready to aid an escape from the confined space; in some cases a harness or other safety equipment may be required (Bolton, 1995). At a minimum, site personnel should be trained to understand how to identify a confined space and know to not enter a confined space unless in accordance with a confined space entry plan.

4.2 H_2S Monitoring Techniques

Because of the low odor threshold associated with H_2S, the detection of odors by site personnel may serve as an initial indication of H_2S emissions at a site. However, as discussed previously, H_2S present at higher concentrations may not be detectable because of the olfactory paralysis that can occur. OSHA (2005) recommends that workers not rely on the sense of smell to indicate the continuing presence of H_2S or to warn of hazardous concentrations. Monitoring of H_2S concentrations can be part of an odor or H_2S evaluation plan. A variety of instruments have been developed that detect H_2S over a range of concentrations for a variety of purposes (e.g., assessing human exposure levels, measuring concentrations in confined spaces or gas collection wells, measuring concentrations in ambient air).

It is important when selecting a device that the purpose of the monitoring is clear and that the appropriate limitations (e.g., detection limits, potential interferences) of a given instrument are understood so that the data gathered meet the H_2S monitoring program's objectives. A presentation and discussion of common types of H_2S monitoring devices is presented in ***Table 4-1***.

Table 4-1. Examples of H_2S Monitoring Devices, Applications, and Limitations

Sampler Type	Applications and Limitations/Interferences
Personal badges	Disposable devices normally used for detecting acute H_2S exposure. Clips on clothing or fits in a pocket near the wearer's breathing zone. Can produce visual, vibratory, or audible alarm upon exceedance of a set standard (10 µL/L is common) or simply produce a color change. H_2S reacts with an indicator layer (e.g., lead acetate). Visual color comparison to exposure dose color (in µL/L*hr) is used to calculate average concentration by dividing this value (in µL/L*hr) by exposure time. Some can detect other gases in addition to H_2S. Temperature limitations may be an issue (one sampler reported in the 16 °C – 36 °C range). They can also be used as stationary monitors over limited periods of time simply by affixing to a pole with the detector facing the emission source. Typical H_2S range: 1–240 µL/L*hr Example products: Industrial Scientific Gas Badge Pro and Gas Badge Plus, Chromair Gas Monitoring Badge, Safeair Gas Monitoring Badge, BW Honeywell Gas Alert Clip Extreme H_2S Monitor
Multi-gas meters	Standard multi-gas samplers typically use an active sample pump to draw gas into the inlet orifice. Used when monitoring of other gases is necessary (e.g., CH_4, CO_2, O_2, CO). Because standards often exist for CH_4 or CO concentrations on site and at the perimeter boundary (i.e., a certain percentage of the LEL) monitoring of H_2S can be conducted in conjunction with these gases. Meters are typically battery-operated and use a microprocessor to display concentrations on a display and can often store data via a data logger; some have alarms that sound at significant concentration levels. Regular calibration is necessary. More elaborate systems are available that operate using an analyzer with a near-infrared laser that quantifies spectral features of molecules in a sample gas passed through an optical measurement cavity. This technology also allows for vehicle mounting and simultaneous gas measurement and mapping of H_2S and CH_4 concentrations. Typical H_2S range: 0–100 µL/L, although other ranges are available Example standard multi-gas samplers: Gas Alert Mac XTII, MSA Altair 4X Multigas Detector, MultiRAE Plus 4 Gas Meter, RKI GX-2003 Multi Gas Monitor, RKI Eagle 2, Example near-infrared laser gas analyzer with mapping capability: Picarro Model G2204
Electrochemical cells/pods	Sensors designed for a specific gas measurement. Operate through diffusion of H_2S (or other gas of interest) into measurement cell where an oxidation (in the case of H_2S) or reduction reaction at the working electrode occurs. Working electrode is typically contained in an acidic solution. A measureable voltage is produced upon oxidation; the measured gas concentration is linearly proportional to the electrical output of the gas sensor. Other gases (NO, H_2, etc.) can cause some interference. Can also utilize a reference electrode that eliminates interference from side reactions. Low temperatures (<freezing) stop chemical reactions and the cell will not function. Oxygen is necessary for reactions; low oxygen environments cannot sustain the current. H_2S is a gas that will oxidize; the presence of a reducible gas may interfere. Typical H_2S range: 1–500 µL/L Example products: CES Landtec GEM 2000/5000 (add-on pod or built-in cell), Delphian Electrochemical Sensor 755, Kimessa AG GSE 627

(continued)

Table 4-1. Examples of H_2S Monitoring Devices, Applications, and Limitations (continued)

Sampler Type	Applications and Limitations/Interferences
Dedicated H_2S meters	Specialty meters that can detect H_2S over a range of low and intermediate concentrations. Technology used includes gold film sensors that work via selective adsorption and desorption. Interference may be caused by some constituents (e.g., chlorine, ammonia, NO_2, and mercaptans) but filters are available to reduce interference. Detection limits on several of the meters were reported as 0.003 µL/L. Meters can be set for either a single sample or survey mode; survey mode provides quicker source detection. Another technology includes the Honeywell Chemcassette system, which uses an optical scanning system to detect a gas via color change. Other technologies include pulsed fluorescence, which converts H_2S to SO_2 and measures the SO_2, thus the measurement of H_2S is indirect. Typical H_2S Range: 0.003–50 µL/L Example products: Arizona Instruments Jerome J605, Jerome 631-X, Jerome 631-XE, Honeywell Single Point Monitor, Thermo Scientific 451i
Remote systems	These systems utilize detectors that can be placed in an area where continuous, remote monitoring is desired (i.e., site perimeter boundary, confined spaces onsite). Remote sensor units are either wired or wirelessly connected to a controller. Detectors can be self-powered (e.g., solar, battery) and selected based on the desired range of H_2S concentrations to be measured. Systems can be changed or expanded to include many monitoring points. Electrochemical sensors are sometimes used for the sensor components. Visual and audible alarms can be produced upon exceedance of a given gas concentration. It is recommended that fixed monitors be placed in low spots due to the H_2S-specific gravity. These dedicated meters are typically expensive as they require infrastructure installation. Example products: Rig Rat III Portable Area Monitoring System, RKI Beacon/Fixed System Sensor Heads
Colorimetric detector tubes	One-time use tubes (with printed H_2S scales on the tube) specific to a certain gas and concentration range is opened (tips broken) and inserted into a pump. Ambient air or gas (e.g., collected in a nonreactive sample container) to measure H_2S is pumped through the tube. Measurements are indicated by the length of the color change in relation to the scale printed on the tube; adjustment factors for sample volume, temperature, and humidity can be applied using manufacturer datasheets. Tubes do not require calibration and may be subject to some interferants, depending on the tube used. Typical H_2S range: Varies depending on product; range-specific tubes are sold (e.g., low, high, ultra-high). Standard range of 25–250 µL/L. Passive colorimetric detection tubes can also be used for longer-term time-weighted average measurements. Example products: Dräger Detector Tubes, RAE Systems H_2S Colorimetric Gas Detection Tubes
Electronic noses	These devices contain an array of sensors that quickly analyze multiple molecules at once; they are utilized in the food, beverage, and perfume industry extensively. They generally consist of a wide array of technologies, including conducting polymer sensors, sintered metal oxide semi-conductors, catalytic metals, organic semi-conductors, surface wave gas sensors, quartz crystal microbalance, electrochemical, smell-seeing, and field effect transistors (Otles 2008).

5. BMP Framework to Manage H_2S Emissions from Disposal of Gypsum Drywall

Most permitted landfills are required to develop and maintain operations plans that cover a wide range of issues and considerations. Normally, odor management is addressed in broad landfill operations plans, but often do not require the background and detail needed to address the potentially severe issues caused by elevated H_2S emissions. Thus, in some cases the development of a site-specific BMP guide may be necessary to allow landfill owners and operators to understand the specific issues and challenges associated with H_2S, provide the landfill operators with valuable documentation that can be used to demonstrate the procedures used to address H_2S emissions, and provide direction to landfill staff so that issues encountered with H_2S emissions can be observed and managed more rapidly. ***Figure 5-1*** presents a simplified flow chart that can be used by landfill owners and operators as a starting point to develop a site-specific BMP guide for H_2S emissions management. Each step presented in Figure 5-1 is described in more detail below.

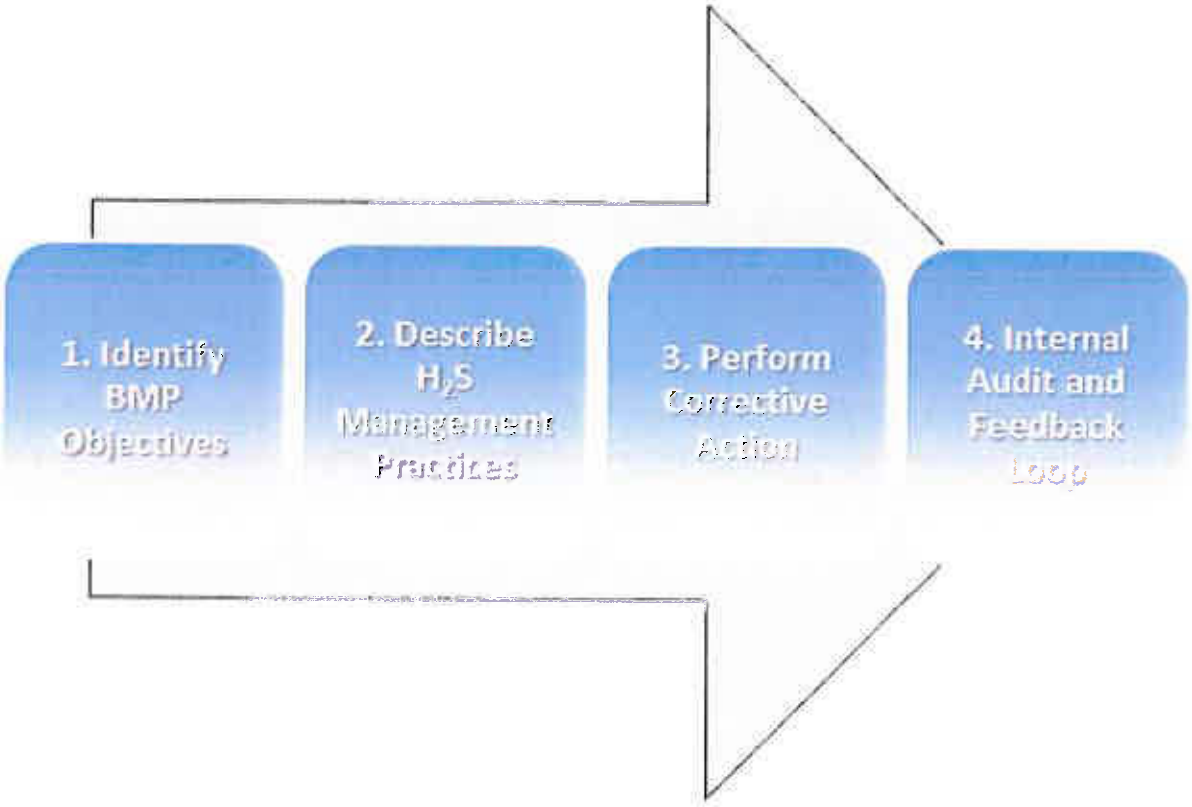

Figure 5-1. Framework for Developing a BMP Guide for Managing H_2S at C&D or MSW Landfills

A discussion of each of the framework elements is provided below.

1. **Identify the BMP guide objectives.** Each landfill's site-specific considerations should be accounted for when the BMP guide is developed. For example, a landfill that accepts large amounts of drywall but has never had odor issues or H_2S emission issues may structure the BMP guide in a way that includes measures to help prevent H_2S emissions. This would be in contrast to the structure of a BMP guide for an MSW landfill that beneficially uses collected LFG and has not had odor issues but has high H_2S levels in the collected LFG. In this case, the guide may be focused on monitoring and maintenance associated with an H_2S treatment system.

2. **Describe the management practices to be employed.** The BMP guide would identify key information, such as responsible parties and lines of communication for maintenance, monitoring, and inspections; types of equipment to use for monitoring; frequency and location(s) of H_2S monitoring (including documentation requirements); and an enumeration of practices that the site adopts based on site-specific conditions to mitigate or otherwise manage H_2S emissions. The conditions and ultimately the management practices employed should consider the variety of sources and conditions that may lead to H_2S production and emission (as described in Section 2) and the procedures that can be used to reduce emissions (as described in Section 3). The description of management practices should also identify action levels that are tailored to the facility's needs, which will be used in conjunction with corrective actions (Step 3 below).
3. **Perform corrective action.** The BMP guide should discuss actions that should be taken if H_2S emissions or concentrations are greater than target levels established for the facility. The corrective action steps may include equipment or monitoring instrument evaluation or calibration, assessment and modification of operating practices, or other activities to mitigate H_2S emissions.
4. **Internal audit and feedback loop.** The efficacy of the BMP guide should be periodically evaluated or audited to ensure that the guide matches up with the needs of the site, as operating needs and conditions at landfills may change frequently. The BMP guide should include a mechanism to provide an effective feedback loop so that gaps or limitations in the procedures for monitoring and addressing H_2S emissions can be quickly identified and remedied.

Statement by
LT Michelle Colledge
Environmental Health Scientist
Division of Regional Operations
Agency for Toxic Substances and Disease Registry
U.S. Department of Health and Human Services
on
ATSDR's Public Health Activities in Warren Township, Ohio
before
The Economic Development and Environment Committee Ohio State Senate

HANDOUT

May 11, 2005

Introduction
Mr. Chairman and Members of the Committee, thank you for inviting me to testify before your committee. My name is Michelle Colledge, and I am an Environmental Health Scientist in the Division of Regional Operations, at the Agency for Toxic Substances and Disease Registry (ATSDR). ATSDR is a federal agency within the United States Department of Health and Human Services. The mission of ATSDR is to "serve the public by using the best science, taking responsive public health actions, and providing trusted health information to prevent harmful exposures and disease related to toxic substances."

ATSDR testimony is not intended to address the specific provisions or merits of any proposed legislation. Today, I will provide the committee with information about Construction and Demolition debris landfills, an overview of the toxicity of hydrogen sulfide gas, and a summary of ATSDR's public health activities in Warren Township, Ohio. I will include an overview of ATSDR's investigation concerning the Warren Recycling facility, any conclusions drawn and recommendations stemming from our involvement there, and potential health effects from exposures to hydrogen sulfide.

Construction and Demolition (C&D) Debris Landfills
Debris from construction and demolition (referred to as C&D waste) is a substantial waste stream in the United States, with hundreds of millions of tons of C&D waste being generated each year(1). The United States Environmental Protection Agency (USEPA) defines C&D debris as waste material that is produced in the process of construction, renovation, or demolition of structures. It consists of concrete, asphalt, wood, metals, gypsum wallboard, and roofing.

Of the components of C&D waste materials, drywall is of special concern. It is a major component of C&D wastes, and its disposal in C&D landfills can result in the production of hydrogen sulfide. Drywall is composed of a core of gypsum ($CaSO_4 \cdot 2H_2O$), covered on both sides with a paper facing and backing(2). When the sulfate in the gypsum is exposed to water, it becomes solubilized in the landfill leachate, and hydrogen sulfide gas is produced through an anaerobic conversion process(3).

Effects of Hydrogen Sulfide Exposure
Hydrogen sulfide is a colorless, flammable gas under normal conditions. In air, people can smell hydrogen sulfide at levels as low as 0.5 parts per billion (ppb), and the odor is usually characterized as smelling like "rotten eggs" or "sewage." Because hydrogen sulfide is ubiquitous in the natural environment, low-level exposures are not uncommon. Natural sources account for approximately 90% of the amount of hydrogen sulfide in the atmosphere. Background concentrations of hydrogen sulfide in outdoor air are typically less that 1 ppb(4).

Short-term exposures to high levels of hydrogen sulfide may cause adverse health effects, including: airway constriction in individuals who have asthma5; decreased lung function6; inability to smell gas (olfactory fatigue)(7-8); and eye irritation (keratoconjunctivitis, punctate corneal erosion, blepharospasm, lacrimation, and photophobia)(9-15). Severe injury and death have been observed with short-term exposures to hydrogen sulfide levels exceeding 100 ppm4, (16-17). Acute exposures to elevated levels of hydrogen

sulfide can result in pulmonary edema and central nervous system effects including dizziness, nausea, headache, and physical collapse(18-21).

Long-term exposures to hydrogen sulfide may also result in adverse health effects. These include: neurologic effects (fatigue, loss of appetite, nausea, headache, vomiting, irritability, poor memory, depression, motor skills, and dizziness)(9, 22-23) and respiratory effects (nosebleeds, breathing abnormalities)(23-25). Several studies have been conducted which show neurologic effects from chronic low-level exposures. These studies have documented deficits in cognitive function, reduced perceptual motor speed, impaired memory, impaired balance, and abnormal mood status. These effects were still evident months and sometimes years after exposures ceased (22-23, 26). The magnitude of exposure in these studies ranged in low parts per billion to low parts per million. As an attachment to my written testimony, I have included a table that outlines current health-based guidance values for hydrogen sulfide exposures.

Summary of ATSDR Investigation in Warren Township

The Warren Township Administration and LaBrae School District petitioned ATSDR in May 2002 to investigate whether illnesses being reported in their community could result from exposures to hydrogen sulfide emissions from the Warren Recycling, Inc. (WRI) C&D landfill. Some residents of the Warren Township Community report that they have experienced symptoms they believe are related to chronic hydrogen sulfide exposure, beginning in fall of 200124. Of special concern to ATSDR is the fact that approximately 1600 students attend a high school and two elementary schools near the landfill (two of which are less than ½ mile from the landfill).

ATSDR began its investigation in the Warren Township Community in August 2002, when we held a public availability session to gather health concerns. More than 150 residents reported similar health effects that they and their families were experiencing, including nausea, headache, vomiting, eye irritation, fatigue, dizziness, and memory loss. Preliminary, unvalidated air samples collected by the landfill's contractor detected a peak concentration of 13 parts per million (ppm) hydrogen sulfide in residential outdoor air. Exposures to this concentration of hydrogen sulfide have been associated with the kind of health effects reported in the Warren Township community. However, insufficient data were available to adequately characterize the levels of exposures within the community. To more fully evaluate exposures, ATSDR conducted an Exposure Investigation, sampling indoor and outdoor air in seven community locations for five months. Air sampling during the Exposure Investigation detected a maximum concentration of 6.1 ppm in residential outdoor air, a level that has been demonstrated to cause headaches and airways restrictions in experimental studies of people with asthma. Some levels were above those associated with increased asthma-related hospital visits for children and reports of eye irritation in occupational and animal studies. Using the detected concentrations of hydrogen sulfide in residential areas and uncontrolled releases from landfill conditions, ATSDR concluded that these conditions posed an urgent public health hazard to citizens of Warren Township. ATSDR uses the "urgent public health hazard" conclusion for sites at which short-term exposures (less than 1 year) to hazardous substances or conditions could result in harmful health effects that require rapid intervention. ATSDR released a report on the Exposure Investigation on November 21, 2003. I have entered a copy of the report into the record. ATSDR recommended the following actions:

1) Warren Recycling Incorporated should stop community member airborne exposure to hydrogen sulfide from outdoor sources as soon as possible. (***Status:*** *Pending enforcement action*)

2) ATSDR should conduct air sampling for other sulfur gases during "odor events," timies when residents report smelling unusual or strong odors.
(***Status:*** *Completed*)

3) ATSDR and the Ohio Department of Health should conduct a health study of the population.
(***Status:*** *Completed 2004; final report pending*)

4) The Ohio Environmental Protection Agency, the City of Warren and Trumbull County Health Departments should identify the source(s) of hydrogen sulfide. (***Status:*** *Completed*)

5) ATSDR should contact the National Institute for Occupational Safety and Health (NIOSH) to determine if there is a need for a health hazard evaluation of landfill workers. (***Status:*** *NIOSH contacted; the landfill*

owner/operator has not granted access.)

6) Warren Recycling Incorporated should reduce the threat of fire and explosion that exists on the landfill and/or from landfill operations.
(***Status:*** *Not adopted. Fires are still occurring.*)

7) Warren Recycling, Inc. should restrict community access to the landfill.
(***Status:*** *Not adopted*)

As a follow-up to the initial Exposure Investigation, ATSDR conducted additional testing for other sulfur gases. C&D landfills are known to release mercaptan, carbon disulfide, and other organic and inorganic sulfur compounds3. The Exposure Investigation identified elevated levels of methyl mercaptan, dimethyl sulfide, and n-butyl mercaptan in additional to hydrogen sulfide.

Continued community concern and continued odor complaints prompted the Ohio Department of Health's State Epidemiologist to request that ATSDR help conduct a health investigation in late May 2004. ATSDR conducted the field portion of this investigation in June and July of 2004. Participants in this study consisted of 107 community members who live, work, or attend school within a 1-mile radius of the facility. From results of a pre-screening respiratory questionnaire, participants were placed in one of three categories: 1) those with existing respiratory conditions, such as asthma (50 people), wore personal air-monitoring badges, kept a daily diary of odors and symptoms, and tested their lung function twice a day using a peak-flow meter instrument, 2) those without existing respiratory conditions (50 people) wore the personal air monitoring badge and kept the daily diary or 3) those who only kept a daily diary (7 people). Residents of five homes also allowed ATSDR to place hydrogen sulfide outdoor air monitors in their yards for the study period. ATSDR anticipates presenting our findings to the community in late spring or early summer of this year.

During the field data collection phase of this study, ATSDR used a real-time hydrogen sulfide monitor to respond to community odor complaints. During one such response, ATSDR found levels of hydrogen sulfide up to 95 ppm in residential air. This prompted a letter from ATSDR's Assistant Administrator to the Warren City Health Director(27). The letter stressed the urgent nature of these elevated hydrogen sulfide readings and recommended the city 1) develop the capacity to monitor for hydrogen sulfide in response to future odor complaints; and 2) develop contingency plans with city, township, and Trumbull County emergency response personnel to shelter-in-place or evacuate community members, based on hydrogen sulfide readings. The City Health Department committed to working with the City Wastewater Treatment Plant to share hydrogen sulfide monitoring devices, and agreed to pursue contingency planning.

Throughout our involvement with this site, ATSDR has worked with partners at the local, state, and federal level. Because explosive levels of landfill gases have been measured on-site(28), and several underground fires have been detected and addressed on-site, ATSDR worked with the LaBrae School Board, local fire stations, and the Trumbull County HAZMAT manager to create a response and evacuation plan in the case of a substantial odor event. ATSDR has provided health advice and guidance to the Warren City Health Department, the Ohio EPA, and the USEPA

ATSDR has determined that residential exposures to hydrogen sulfide pose a health hazard to residents in the Warren Township community. The siting of the landfill within an existing community, in combination with construction and maintenance inadequacies of the landfill, has allowed these conditions to become a substantial problem for the health and safety of nearby residents and for the state of Ohio. These concerns have led Ohio EPA to request an Emergency Removal Action under the USEPA's Comprehensive Environmental Response, Compensation, and Liability Act authority, which was accepted and is currently in progress. ATSDR has worked very closely with local, state, and federal health and environmental agencies at this site. Since ATSDR became involved at the Warren Recycling Landfill, similar odor problems have been identified at other C&D landfills in Ohio.

Thank you for inviting me here to testify before the committee. I have provided you with information related to C&D debris in landfills, the toxicity of hydrogen sulfide gas, and ATSDR activities in Warren Township, Ohio.

Guidance values for inhalation exposure to hydrogen sulfide

Concentration, ppb	Exposure Period	Source
1.4	Lifetime	USEPA RfC
20	14-365 days	Intermediate MRL
100	1 hour	AIHA ERPG-1
200	14 days	ATSDR Acute MRL
1.4	Lifetime	USEPA RfC
10,000	10 minutes	NIOSH 10 minute ceiling
30,000	1 hour	AIHA ERPG-2

USEPA: U.S. Environmental Protection Agency

RfC: Reference Concentration–level protective of public health, even sensitive populations

MRL: Minimal Risk Level–level protective of public health, even sensitive populations

AIHA: American Industrial Hygiene Association

ERPG: Emergency Response Planning Guide–1-hour level of exposure that would result in mild, transient health effects (ERPG-1), irreversible health effects (ERPG-2), or serious injury or death (ERPG-3).

NIOSH: National Institute for Occupational Safety and Health, Centers for Disease Control and Prevention

Construction and demolition (C&D) debris comprises a significant portion of the solid waste stream in the United States. Because C&D debris is largely regulated at the state level, the requirements for C&D debris disposal facilities vary from state to state. A review of state regulations was conducted to determine C&D debris disposal facility requirements, including specific requirements for liners, leachate collection, groundwater monitoring, location restrictions, operator training, waste spotters, final cover, financial assurance, and recycling. This review found that little consistency exists in the regulation of C&D debris facilities among states. Twenty-three states require liners, while 27 require groundwater monitoring. Seventeen states reported having regulations pertaining to recycling C&D debris. Several states are currently in the process of reviewing and updating their C&D debris regulations, an indication of the greater recognized importance of this fraction of the solid waste stream.

The authors acknowledge Joe Aufmuth, Faculty Librarian and GIS Coordinator, and Jones Edmunds and Associates for their assistance in the development of the included maps. The authors thank the solid waste regulatory programs in each state for their participation in the survey and their comments on draft versions of this article.

KEY WORDS: C&D debris, disposal, landfills, regulations, solid waste

Once dismissed as a small segment of the solid waste stream, construction and demolition (C&D) debris (often referred to as C&D waste or simply as C&D) is a topic of growing interest for the solid waste industry. C&D debris, household and commercial refuse, and yard trash are often lumped together and described as municipal solid waste (MSW). C&D debris differs in both physical form and chemical content from other MSW components, and because of its unique management issues and challenges, it has become more common to distinguish C&D debris as its own separate waste stream. Unlike household and commercial refuse, C&D debris is not heavily regulated under U.S. federal regulations, leaving individual states to develop their own appropriate regulatory strategies. State environmental agencies have adopted a variety of approaches for regulating C&D debris. While C&D debris recycling is becoming more common, landfilling is still the predominant practice, and, as such, most state regulatory programs focus on land disposal of C&D debris. The promulgation of regulations pertaining to C&D debris recycling, however, is a growing trend.

This paper presents the results of a survey of U.S. federal and state regulations pertaining to C&D debris. The objective of this review is to provide useful information to those involved with the generation, management, or regulation of this waste stream. The information summarized was gathered by the authors through a review of the regulations and through contacts with relevant regulatory officials. The rules themselves or the appropriate agency, however, should be consulted as needed, as regulations change and may be subject to interpretation. References for all regulations are cited at the end of this paper.

C&D DEBRIS BASICS

C&D debris results from the construction, renovation, and demolition of buildings, roads, and bridges and often includes material produced during site preparation (e.g., land-clearing debris). Residential, commercial, industrial, and governmental sectors all contribute to this waste stream. A U.S. Environmental Protection Agency (U.S. EPA)-sponsored study estimated that 123 million metric tons of building-related C&D debris, (1.27 kg [2.8 lb] per person per day) were generated in the United States in 1996,[14] compared to 190 million metric tons (1.95 kg [4.3 lb] per person per day) of non-C&D debris MSW produced in the same year.[15] If the amount of debris generated from non-building-related C&D debris sources (e.g., concrete and asphalt from roadwork) were added, the total amount of C&D debris would likely exceed the total amount of other MSW sources.

Downloaded By: [University of Illinois at Chicago] At: 13:40 16 October 2007

While the composition of C&D debris varies as a function of the activity generating the waste, the major components include wood, concrete, metal, roofing material, cardboard, gypsum wallboard, and soil. Other components, such as packaging, electrical wire, and insulation, also occur, as do small amounts of other materials that are not classified as C&D debris (e.g., food wrappers, hazardous waste). The exact amount of landfilled C&D debris is not known, but a large fraction of C&D debris, especially mixed building-related debris, is land disposed.[14] Large, homogeneous sources of debris (e.g., concrete, asphalt pavement) are frequently recycled. Some mixed C&D debris is also recycled, with separation occurring at central processing facilities. Recent efforts to separate and recycle construction debris at the construction site,[24] as well as to deconstruct buildings and reuse building components,[27,59] account for a small but growing management option.

Historically, C&D debris has been considered to be relatively inert and composed of materials that will not pose an undue environmental risk, even when managed in uncontrolled disposal facilities. Various potentially dangerous materials, however, are now recognized to occur in some sources of C&D debris. Heavy metals such as lead (paint, pipe solder, flashing, batteries), mercury (lighting, electrical switches, thermostats), cadmium (batteries, paints), and arsenic (treated wood) are common ingredients of many building components.[54] Polychlorinated biphenyls are still encountered in many older lighting ballasts, transformers, and capacitors, as well as numerous other materials.[7] Asbestos building products include floor tiles, roofing mastic, pipe insulation, and cement siding.[6,17] As a result, the unsafe management of C&D debris can pose a risk to human health and the environment from its generation (e.g., the demolition process) to its final disposition (e.g., disposal in a landfill). Even the primary building components themselves (e.g., drywall, wood) can impact the quality of groundwater underneath an unlined C&D debris disposal facility.[60,65] The growing awareness of the potential risks posed by C&D debris has spurred the development of regulatory programs to limit unsafe management practices.

Federal Regulations Governing C&D Debris

The U.S. EPA does not specifically regulate C&D debris. The Resource Conservation and Recovery Act (RCRA) governs the U.S. federal solid waste management system. Under RCRA, C&D debris is a solid waste and therefore can potentially be a hazardous waste. C&D debris is not included as a listed hazardous waste. Several building materials do, however, have the potential to be characteristic hazardous wastes. Discarded oil-based paints and solvents from a construction project would be ignitability characteristic hazardous wastes. Some batteries and cleaners meet the definition of corrosivity characteristic hazardous wastes. Building materials containing elements

Downloaded By: [University of Illinois at Chicago] At: 13:40 16 October 2007

such as lead, mercury, cadmium, and arsenic may be toxicity characteristic (TC) hazardous wastes.[54] Not only are some discrete components found in buildings hazardous wastes, but the buildings themselves may be hazardous wastes if painted or contaminated with toxic chemicals (e.g., coated with lead-based paint). The relatively small mass of toxic elements compared to the rest of the building materials makes it very unlikely, however, that an entire structure would require management as a hazardous waste.

The RCRA hazardous waste regulations can impact the management of C&D debris in a number of ways, depending on the amount generated. A generator producing more than 100 kg of hazardous waste per month must send the hazardous waste to a permitted hazardous waste management facility. Generators producing less than 100 kg per month of hazardous waste (known as conditionally exempt small quantity generators, CESQGs) can dispose these materials in any state permitted solid waste management facility, including C&D debris landfills. The U.S. EPA does require operators of unlined landfills that accept CESQG hazardous waste to monitor the groundwater at the site (40 CFR 257).[60] Since many states either ban hazardous waste from landfill disposal (including CESQG hazardous waste) or exclude hazardous wastes as part of the definition of C&D debris, the relevance of the 257 regulations for C&D debris is limited. In an effort to streamline the removal of lead paint from residential housing, the U.S. EPA recently clarified that lead-based-paint debris removed from residential structures did qualify for the household waste exclusion under RCRA and thus was not a hazardous waste.[12]

Several other federal statutes and regulations may impact C&D debris management. Contractors renovating or demolishing buildings containing asbestos may be required to comply with the specific removal and disposal requirements found in the National Emission Standards for Hazardous Air Pollutants (NESHAP) regulations in 40 CFR 61. The asbestos NESHAP specifies proper containment for asbestos-containing waste and proper final cover requirements to prevent particulate matter from entering the air.[6] Since states determine the definition of C&D debris, a few states include asbestos waste within the definition of C&D debris. Many, however, forbid the disposal of asbestos-containing waste in C&D debris landfills. PCB ballasts from renovation and demolition debris are regulated under the Toxic Substances Control Act (TSCA) in 40 CFR Part 761.[7] Regulations regarding the disposal of lead-based paint debris were at one time proposed under TSCA,[11] but the rule never progressed beyond a proposal. Under the Comprehensive Environmental Response Compensation and Liability Act (CERCLA), also known as Superfund, C&D debris generators are strictly liable for any hazardous wastes that they dispose. Thus, even if not generating a hazardous waste under RCRA, generators and landfill operators could be held liable for future contamination from the management their C&D debris.

Downloaded By: [University of Illinois at Chicago] At: 13:40 16 October 2007

State Regulations Governing C&D Debris

Since the vast bulk of materials encountered in C&D debris does not contain asbestos and is not hazardous waste, management requirements for the majority of C&D debris produced in the United States are not covered by federal regulations. Most states have promulgated their own C&D debris management rules, including defining what waste materials are considered C&D debris and what components must be excluded. Requirements for groundwater monitoring, liner construction, site restrictions, financial assurance, training requirements, and recycling vary from state to state. These variations are primarily a result of the unique characteristics of each state and include variables such as annual rainfall, annual temperature range, land availability, and geologic stability, as well as perceptions by local policymakers and regulator as to the relative risk that C&D debris poses to human health and the environment. While the states have the freedom to create regulations to fit their unique situations, the lack of federal guidance has lead to inconsistent regulations throughout the nation.

METHODS

State solid waste regulations were reviewed and sections pertinent to C&D debris disposal were summarized into a one-page form submitted electronically to each state regulatory agency. Each appropriate state regulatory program was subsequently contacted via telephone or electronic mail for verification and comment on the program's requirements. These requirements were then interpreted by the authors and again submitted to state regulatory programs for final comment. The interpretations of the rules presented in the following sections are those of the authors, though state agencies were consulted for verification. Questions regarding more recent rule language or the interpretation of a rule should be directed to the appropriate state agency.

RESULTS

This state C&D debris regulation survey revealed a large diversity of requirements and approaches. This is illustrated in Table 1, which summarizes the state rules and requirements. Twenty-three states were found to have specific C&D debris disposal regulations (i.e., requirements for facilities that are separate and apart from MSW landfills). In other states, C&D debris is regulated under requirements for more general inert debris landfills, non-MSW landfills, MSW landfills, or general solid waste facilities. The detailed summaries of each state's C&D debris disposal requirements are provided in subsequent sections.

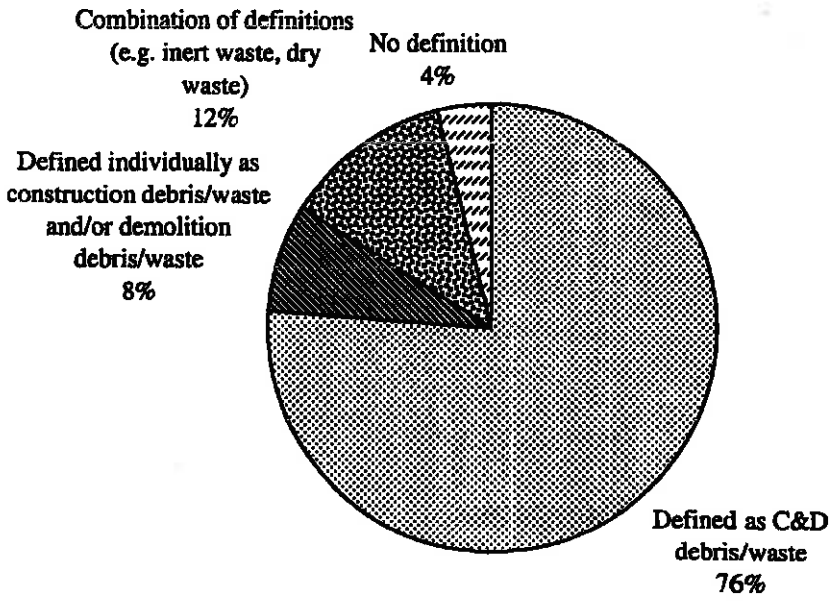

FIGURE 1. Summary of state C&D debris definition categories.

Definitions

The lack of a federal regulatory definition for C&D debris has resulted in each state defining C&D debris somewhat differently. The inclusion or exclusion of specific components within the C&D debris definition affects management of the waste. In addition, definitions are often included for waste streams that are in some way a part of or related to C&D debris, including dry waste, inert waste, land clearing debris, rubble, and rubbish. Figure 1 summarizes the range of definitions encountered. Most states (76%, 38 states) provide a definition for C&D debris or C&D waste. An additional four states instead individually define the terms construction debris/waste and/or demolition debris/waste, making forty-two states that specifically describe this waste stream. Some state definitions contain extreme detail regarding the source of C&D debris, their components, and prohibited materials. For example, Michigan defines *C&D debris* as:

> Waste building materials, packaging, and rubble that results from construction, remodeling, repair, and demolition operations on houses, commercial or industrial buildings, and other structures. Construction and demolition waste includes trees and stumps which are more than 4 ft in length and 2 inches in diam and which are removed from property during construction, maintenance, or repair. Construction and demolition waste does not include any of the following, even if it results from the construction, remodeling, repair, and demolition of structures: (i) Asbestos waste.

Downloaded By: [University of Illinois at Chicago] At: 13:40 16 October 2007

> (ii) Household waste. (iii) Corrugated containerboard. (iv) Appliances. (v) Drums and containers. (vi) Any aboveground or underground tank and associated piping, except septic tanks. (vii) Solid waste that results from any processing technique which renders individual waste components unrecognizable, such as pulverizing or shredding, unless the type and origin of such waste is known not to contain the wastes listed in paragraphs (i) to (vi) of this subdivision.[33]

Other states provide much more general descriptions; Montana defines *C&D debris* as:

> Waste building materials, packaging, and rubble resulting from construction, remodeling, repair, and demolition operations on pavements, houses, commercial buildings, and other structures, once municipal, household, commercial and industrial wastes have been removed.[37]

Outside of the definition of C&D debris/waste, some states choose to define construction and/or demolition waste separately. While six states define construction waste and eight states define demolition waste, only three of these states define both. Virginia, one of the three states that defines both, defines *construction waste* as:

> Solid waste which is produced or generated during construction, remodeling, or repair of pavements, houses, commercial buildings, and other structures. Construction wastes include, but are not limited to lumber, wire, sheetrock, broken brick, shingles, glass, pipes, concrete, paving materials, and metal and plastics if the metal or plastics are a part of the materials of construction or empty containers for such materials. Paints, coatings, solvents, asbestos, any liquid, compressed gases or semi-liquids and garbage are not construction wastes.[63]

while *demolition waste* is defined as:

> Solid waste which is produced by the destruction of structures and their foundations and includes the same materials as construction wastes.[63]

As C&D debris is often included in other waste categories, the lack of a specific definition for construction or demolition waste does not exclude the waste from another definition. Sixteen states include C&D debris in their definition of inert waste. Land-clearing debris can include C&D debris in six states. C&D debris is included within eight state definitions of rubbish and three state definitions of rubble. Some states such as Alaska define inert waste only and not C&D debris. Alaska defines *inert waste* as:

Downloaded By: [University of Illinois at Chicago] At: 13:40 16 October 2007

> Solid waste that has a low potential to pollute air or water, and that does not normally attract wildlife; includes coal power plant ash, scrap metal, auto fluff, construction and demolition waste, and pavement rubble; does not include asphalt material that contains asbestos.[2]

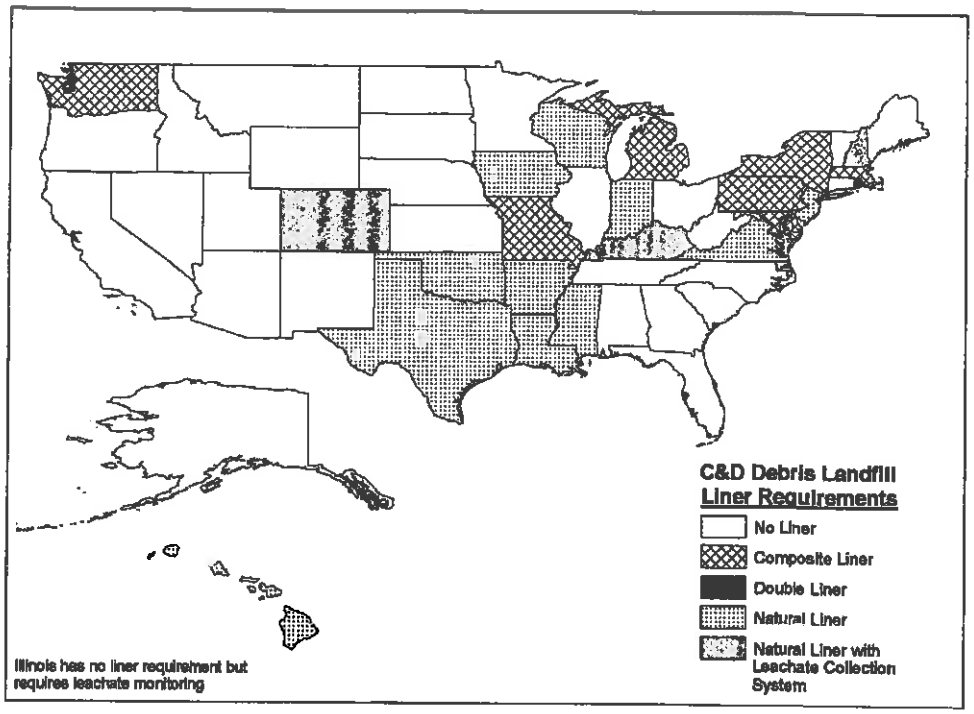
Other states define both C&D debris and inert waste. California, for example, defines *inert waste* as:

> Subset of solid waste that does not contain hazardous waste or soluble pollutants at concentrations in excess of applicable water quality objectives, and does not contain significant quantities of decomposable waste.[5]

As suggested by Alaska's and California's definitions, inert waste could potentially include most of the C&D debris stream, as well as other types of non-C&D debris materials. Land-clearing debris, on the other hand, is typically more narrowly defined.

Landfill Liner Requirements

Figure 2 summarizes state liner requirements by five categories: (1) those with no liner requirement, (2) those requiring natural soil liners but with



Note: Location or site-specific issues may result in more stringent requirements.

FIGURE 2. Minimum acceptable landfill liner requirements for C&D debris landfills.

Downloaded By: [University of Illinois at Chicago] At: 13:40 16 October 2007

no leachate collection system, (3) those requiring natural soil liners with leachate collection system, (4) those requiring composite liners, and (5) those requiring double liners. By limiting the materials that are defined as C&D debris, landfills that accept C&D debris in certain states including Connecticut and Idaho are not required to have liners. Of the states that require liners, the most common liner is a natural clay or soil liner of a specified thickness and permeability. States such as Louisiana, Arkansas, Iowa, and Oklahoma require natural liners. Additional requirements to the natural liner system may include a leachate collection system, as C&D debris landfills in Colorado must have. Some states requiring composite liners have regulations specifically for landfills handling C&D debris (e.g., Maryland), while some require composite liners because C&D debris falls under MSW regulations (e.g., Hawaii). The one state with a double liner requirement, Rhode Island, also manages C&D debris in MSW landfills.

These categories reflect the minimum technology that a landfill accepting C&D debris must have in these states. In several states (e.g., Alabama, Oregon, New Jersey), more stringent requirements may be necessary depending on site-specific conditions (e.g., location, rainfall). If a landfill restricts the type of C&D debris accepted, some states may consider less stringent requirements (e.g., Kentucky). Twenty-seven states permit disposal of C&D debris into unlined landfills (excluding any prohibited materials mentioned within the regulations). The remaining 23 states have varying degrees of liners systems presented in Figure 2.

Monitoring

Figure 3 summarizes the state groundwater monitoring requirements. Twenty-seven states require groundwater monitoring. More detailed information regarding landfill requirements can be determined by comparing Figure 2 to Figure 3. Eight of the unlined landfill states require groundwater monitoring. The other 19 states do not require groundwater monitoring. Nineteen of the states that require liners also require groundwater monitoring while four states that require liners do not require groundwater monitoring.

Other Permit Issues

Financial assurance requirements are included for some states in the C&D debris section of the state regulations, while in other states they may be outlined in the general solid waste section, which covers C&D debris landfills (unless they are not specifically excluded). Those states with specific sections for C&D debris landfills may require financial assurance within the C&D debris landfill section, while specific details concerning procedures and assurance options are contained in a separate financial assurance section within

Downloaded By: [University of Illinois at Chicago] At: 13:40 16 October 2007

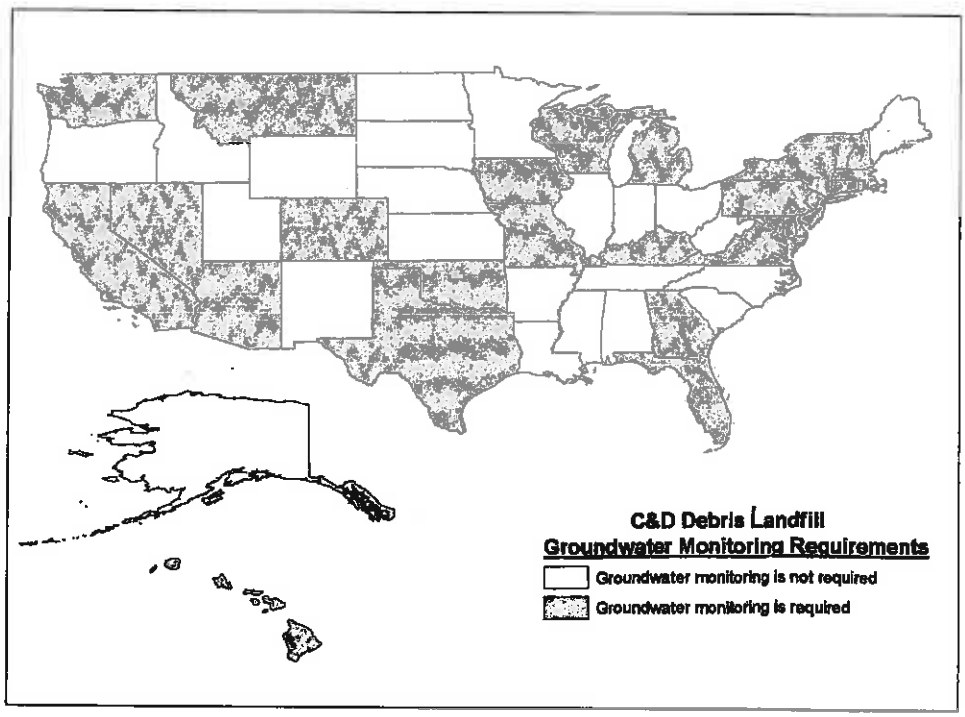


FIGURE 3. Minimum groundwater monitoring requirements for C&D debris landfills.

the greater solid waste management rules. Financial assurance requirements vary from requiring a specific amount per acre of the landfill to a minimum of operation and maintenance costs for a period after closure (e.g., 30 years).

Twenty-six states include specific personnel requirements. Twenty-one states require operator training. Most states require a plan to prevent hazardous wastes from being disposed at the facility, implying some type of waste screening should take place; only eleven states specifically require a spotter to identify unauthorized wastes. Six of the states requiring spotters include waste screening programs within their operator training.

C&D Debris Recycling

Because of the growing awareness that C&D debris is not as inert as once thought,[28,60,65] some states are revising their C&D debris regulations. States that provided current regulatory information but are in the process of developing new regulations include California, Kansas, North Carolina, Ohio, South Carolina, Washington, Colorado, and Massachusetts. The new rules will further regulate C&D debris landfills and C&D debris recycling practices and facilities. Increased regulation of C&D debris landfills can cause tipping fees to rise, thereby encouraging recycling. In other states (e.g., Florida),

Downloaded By: [University of Illinois at Chicago] At: 13:40 16 October 2007

recycling of C&D debris is encouraged by the nature of the local area. C&D landfills are scarce in South Florida because of lack of proper land to construct them, so recycling of C&D debris is a thriving industry. However, land is plentiful in North Florida, so C&D debris is mostly disposed in landfills there. Other states with small or limited land masses are trying to encourage C&D debris recycling with guidance and education (e.g., Hawaii) or with regulations (e.g., Massachusetts).

The primary alternative to landfill disposal of C&D debris is management at a recycling facility. C&D debris recycling facilities are large processing operations designed to separate materials from one another and to process the materials for subsequent reuse. In some cases, individual components are recovered for a variety of recycling markets. In other cases, combined materials are size-reduced for use as cover or fill materials at landfills. C&D debris processing facilities are much less uniformly regulated as compared to landfills. Seventeen states reported having processing facility requirements. This number may be larger because processing facilities may be covered under broader programs for such facilities. Some states, however, do have specific C&D debris processing or recycling facility regulatory requirements (e.g., Florida). These facilities have many of the same regulations as landfills, such as operator training and groundwater monitoring. It should be noted that even in those states where recycling facility regulations are in place, they usually only apply to facilities that accept mixed C&D debris as opposed to a single-stream debris (e.g., concrete or asphalt). Facilities that recycle only concrete or asphalt may not be regulated under solid waste regulations.

Several states have impending regulations that will impact C&D debris recycling. Massachusetts will ban concrete, asphalt, brick, wood and metal from landfill disposal in July 2006. California developed tiered regulations for recycling facilities requiring a mixed C&D debris recycling facility that accepts more than 160 metric tons (175 tons) per day (recycling at least 60% of that) to obtain a solid waste permit.

Detailed State C&D Debris Regulation Summaries

The information presented to this point summarizes the survey results and provides an overview of state C&D debris regulations. However, to fully understand the scope and variability of state C&D debris regulations, it is important to note the specific details of each state's C&D debris regulatory program. These details are presented as follows.

ALABAMA

Alabama defines *construction/demolition waste* and *rubbish*. Liner systems or groundwater monitoring are not required. Facilities are prohibited from

Downloaded By: [University of Illinois at Chicago] At: 13:40 16 October 2007

restricting water flow in floodplains, impacting endangered species, locating in geologically unstable areas, and impacting water quality in or near wetlands, beaches, or dunes. Training is required for the operator and spotter. Spotters are required to inspect all suspicious loads into the facility. Final cover consists of at least 15 cm (6 in) of earthen material capable of sustaining native vegetation (defined as the erosion layer), with a layer at least 46 cm (18 in) of compacted earthen material (that is not sand) underneath (defined as the infiltration layer).[1]

ALASKA

Alaska defines *inert waste* to include C&D debris. A liner system is not required for an inert waste landfill. Groundwater monitoring is not required at a landfill with a total volume less than 765 m^3 (1000 cubic yards) that only accepts inert waste and receives no more than 63.5 cm (25 in) in annual rainfall. If noninert waste is present or has been present at the site or evidence exists of a spill or groundwater contamination, then groundwater monitoring is required during the active life of the landfill. All other C&D debris facilities require groundwater monitoring. If groundwater monitoring is required during the active life of the landfill, it will also be required for postclosure. Even if it had not been required during the active life of the landfill, postclosure monitoring still may be required to ensure protection of the health and safety of the environment. If postclosure groundwater monitoring is required, then financial assurance must include the cost of postclosure monitoring. Otherwise, only the financial responsibility for closure is required. Any unlined landfill must be at least 3 m (10 ft) above the highest measured aquifer level or constructed 60 cm (2 ft) above the natural ground surface. Typically, landfills cannot be placed on permafrost unless no practical alternative exists. Operator training and spotters are not required for an inert waste landfill. Landfill operators must post a sign at the entrance stating that disposal of hazardous waste and PCB waste (polychlorinated biphenyls) is not permitted and notify regulators if improper waste is found at the facility. When closing the facility, a final soil cover at least 60 cm (24 in) thick is required.[2]

ARIZONA

Arizona has not yet established rules for C&D debris landfills. C&D debris is included within the definition for *Non-MSW*, but the state does not have guidelines for Non-MSW landfills. However, stringent state aquifer protection requirements require groundwater monitoring at all C&D debris landfills.[3]

ARKANSAS

Arkansas defines *construction and demolition debris* and *demolition debris*, both of which are typically disposed in Class 4 landfills (C&D landfills). A natural liner consisting of 46 cm (18 in) of compacted clay with a hydraulic

Downloaded By: [University of Illinois at Chicago] At: 13:40 16 October 2007

conductivity no greater 1×10^{-5} cm/sec is required. Leachate collection and groundwater monitoring are not required. Class 4 landfills may not be located in floodplains (if the landfill restricts flow or cannot prevent wash out of solid waste), wetlands, or geologically unstable areas. Landfills must have buffers from wells or water intakes used for drinking water, existing dwellings, and highways. Operator training is required. Although spotters are not required, a plan to exclude hazardous waste must be developed. The final cover must consist of 15 cm (6 in) of earthen material capable of sustaining plant growth (defined the erosion layer) and 46 cm (18 in) of clay soil barrier layer with hydraulic conductivity equal to the liner (defined as the infiltration layer). Financial assurance is required.[4]

CALIFORNIA

California defines *construction and demolition wastes*. C&D wastes are disposed in Class III landfills. A liner system is required when current site characteristics cannot ensure the protection of the quality of ground or surface water. In this case, Class III landfills must have a single clay liner with hydraulic conductivity of 1×10^{-6} cm/s or less. The clay liner should be a minimum of 30 cm (1 ft) thick and be installed with a relative compaction of at least 90%. Leachate collection is required at those facilities with a liner. Groundwater monitoring is required at all facilities. Facilities are prohibited from locating on a Holocene fault and must maintain a 1.5 m (5 ft) barrier between the lowest part of the waste disposal area and the highest ground water elevation. Operator training is required and includes identification and screening of hazardous materials. The final cover system consists of a foundation layer, a low-hydraulic-conductivity layer, and an erosion-resistance layer. The foundation layer should be at least 60 cm (2 ft) of soil or a similar material. The second layer should have a hydraulic conductivity of 1×10^{-6} cm/sec and consist of soil that is at least 1 ft thick. The erosion-resistant layer should be capable of sustaining plant growth requiring at least 1 ft of soil. Financial assurance is required.[5] California is currently creating regulations for C&D processing facilities.

COLORADO

Currently, C&D debris falls under standard solid waste rules. The Colorado Department of Public Health and Environment has reserved Section Four of the rules for C&D debris and inert debris disposal, but presently these wastes are disposed according to standard solid waste rules. Hence, either a natural liner or a composite liner is required. Two natural liner systems are allowed: (1) a barrier layer composed of soil or bedrock with a minimum thickness of 6.1 m (20 ft) with in situ hydraulic conductivity demonstrated to be less than or equal to 1×10^{-6} cm/sec and an upper layer of 30.5 cm (12 in) thick recompacted soil with a hydraulic conductivity no greater than 1×10^{-7} cm/sec, or (2) a soil liner at least 91 cm (3 ft) thick of compacted soil

Downloaded By: [University of Illinois at Chicago] At: 13:40 16 October 2007

with a hydraulic conductivity less than or equal to 1×10^{-7} cm/sec. Composite liner systems must have a lower natural component of at least 60 cm (2 ft) of compacted soil with a hydraulic conductivity less than or equal to 1×10^{-7} cm/sec and an upper flexible membrane liner (FML) at least 0.76 mm (30 mil) thick (1.5 mm [60 mil] if HDPE). A leachate collection system and groundwater monitoring are required. Landfills may not be located in wetlands, near a fault, in geologically unstable areas, in floodplains, or below or in surface water or groundwater. Operator training and spotters are not required.

Colorado requires either a soil final cover or a composite final cover. The soil final cover must have at least 46 cm (18 in) of earthen material with a permeability no more than the bottom liner system or 1×10^{-5} cm/sec, whichever is less (defined as the infiltration layer) and then a layer with a minimum 15 cm (6 in) of earthen material capable of sustaining native plant growth (defined as the erosion layer). The composite final cover has a foundation layer of at least 15 cm (6 in) of soil, which is immediately above the refuse. This forms a suitable foundation for the geomembrane barrier layer, which is no less than 0.76 mm (30 mil) thick and displays properties adequate for its intended purpose.

Financial assurance is required. Typically, financial assurance for C&D debris and inert debris landfills follow the 30-year maximum assurance required for MSW landfills, but the agency can shorten this requirement. Although Colorado has no specific rules for C&D debris landfills, the agency is currently working on recycling requirements for solid waste in general, which may affect the processing of C&D debris.[8]

CONNECTICUT

Connecticut defines *C&D waste* but has no liner requirements; however, according to the Connecticut Department of Environmental Protection (CDEP), the lack of regulatory requirements for a liner system allows regulatory flexibility. Currently, CDEP requires any new or horizontally expanded C&D debris landfill to have a liner system, and a groundwater discharge permit is required. Final cover at a C&D debris landfill consists of a minimum of 60 cm (2 ft) of low-permeability soil, and a few situations required a membrane cap. Connecticut requires operator training but does not require a spotter. Location requirements are not specified but are subject to regulatory siting criteria. Financial assurance is required for closure and post-closure maintenance costs. For new landfills, the state's solid waste management plan "recommends" that recycling opportunities should be considered and incorporated into the design and operation of a C&D landfill.[9]

DELAWARE

Delaware does not define C&D debris; however, according to Delaware's Regulations Governing Solid Waste (DRGSW), C&D debris is covered under

Downloaded By: [University of Illinois at Chicago] At: 13:40 16 October 2007

two categories, dry waste and industrial waste. The definition for *dry waste* includes the following:

> Plastics, rubber, lumber, trees, stumps, vegetative matter, asphalt pavement, asphaltic products incidental to construction/demolition debris, or other materials which have reduced potential for environmental degradation and leachate production.

The definition for *industrial waste* includes:

> Any water-borne liquid, gaseous, solid or other waste substance or a combination thereof resulting from any process of industry, manufacturing, trade or business, or from the development of any agricultural or natural resource.

Although C&D debris is not specifically defined, typical C&D debris components are included in the dry waste definition; and construction and demolition are considered a business in which industrial waste is produced; therefore, C&D debris would be disposed of in an industrial waste landfill.

A composite liner system is required for the landfills. The lower liner must be 60 cm (2 ft) thick compacted clay with a hydraulic conductivity of 1×10^{-7} cm/sec or less. The upper synthetic liner material should be at least 1.14 mm (45 mil) and made of materials that will not fail due to physical contact with leachate, weather conditions, or stresses from installation and use. Natural material liners may be constructed only in areas where the groundwater is not and will not be used for water supplies and where the subbase is subject to compaction and settlement such that a synthetic membrane would not be feasible. Leachate collection, treatment, disposal, and monitoring are required regardless of the type of liner system. Groundwater monitoring is required. Operator training and spotter training are not required by this regulation, but individual permits address the training requirements for employees.

Regulations prevent location within a 100-year floodplain; wetlands; 1 mile of state or federal wildlife refuge, wildlife area, or park; wellhead protection areas where valuable aquifers would be threatened; 200 ft of a facility boundary; or areas that are environmentally unique or valuable. Each landfill must observe any locally adopted land use plan or zoning requirements. The capping system must be constructed of a final grade layer of soil at least 6 inches thick, an impermeable layer of either a 0.76-mm (30-mil) geomembrane over a geotextile or 61 cm (24 in) of clay with a hydraulic conductivity less than 1×10^{-7} cm/sec, and a final cover of 46 cm (18 in) of soil and 15 cm (6 in) of topsoil or other approved alternative. Financial assurance is required.[10]

Downloaded By: [University of Illinois at Chicago] At: 13:40 16 October 2007

FLORIDA

Florida defines *construction and demolition debris*, which is typically disposed in C&D debris landfills. Liners and leachate collection systems are not required; however, based on the types of waste received, methods for controlling the types of waste disposed, the proximity of groundwater and surface water, and the results of the hydrogeological and geotechnical investigations indicating that operation of the facility is reasonably expected to result in violations of groundwater standards and criteria, the Florida Department of Environmental Protection (DEP) can require a liner before a permit is granted. Groundwater monitoring is required on a semiannual basis. If the facility is within 60 m (200 ft) of a water body, surface water sampling may be required.

An operation and a closure plan are required. Spotters are required at the working face to inspect incoming waste at all times. Operators and spotters must be properly trained, and a training plan must be included in the permit application. Operators must have 20 hours of training in the first year and 15 hours continuing training in each subsequent three-year period. Spotters require training at the same frequency, but only 8 hours initially and 8 hours continuing.

Final cover must be placed within 180 days of reaching final grade. The final cover must consist of a 60 cm (24 in) thick soil layer, the upper 15 cm (6 in) of which shall be capable of supporting vegetation and graded and compacted as necessary to eliminate ponding, promote drainage, and minimize erosion. Florida has C&D debris material recover facility (MRF) regulations; the requirements are similar to the landfill regulations, including groundwater monitoring, spotter requirements, training requirements, and financial insurance. To encourage recycling of C&D debris, Florida requires segregated disposal of C&D debris at MSW landfills (usually by employing two working faces). Residuals from C&D debris processing facilities can be directly landfilled.[13]

GEORGIA

Georgia defines *construction and demolition waste* and *inert waste*. Inert waste may be disposed in a C&D landfill, but C&D debris may not be disposed in an inert landfill. *Inert* is defined as stumps, brush, limbs, leaves, broken concrete, broken asphalt, dirt, rocks, and dirt-like products. A liner is not required for C&D landfills; however, groundwater and methane gas monitoring is required. Rules specify operator training but do not require a spotter. Minimum distances are required from fault areas, unstable areas unless the facility is designed to withstand dangers, significant groundwater recharge areas, private water supply wells, and surface water. Facilities located in a floodplain should not restrict water flow. Facilities should not be located in wetlands or over seismic impact zones. Percolation into final

Downloaded By: [University of Illinois at Chicago] At: 13:40 16 October 2007

cover should be minimized. Vegetation should be in place within two weeks after final cover placement. Financial assurance is required. Facilities that shred, bale, or recover materials or engage in other processing operations must have a properly trained operator on duty at all times during operation. These facilities must also have a designated C&D debris unloading (tipping) area, and adhere to any air quality requirements.[16]

HAWAII

Because of Hawaii's small land mass and population, typically no more than one landfill (an MSW landfill) exists per island. Two C&D debris landfills exist in Hawaii: one is on Oahu, and the other on Maui.[16] The majority of the C&D debris waste generated on Hawaii, Kauai, Molokai, and Lanai goes to MSW landfills, with a smaller portion being recycled. The solid waste rules define *construction and demolition waste, demolition waste,* and *inert waste.* Both C&D landfills and MSW landfills are regulated by the Hawaii Department of Health (DOH), and most C&D debris in Hawaii is disposed in C&D landfills.

MSW landfills must meet federal Subtitle D landfill requirements (40 CFR 258). C&D debris landfills are required to obtain a solid waste management permit and meet requirements specified in the permit. C&D debris landfills must include a leachate management plan that requires a soil liner at least 60 cm (2 ft) thick with a maximum permeability of 1×10^{-5} cm/sec or an alternative dependent on the hydrogeological condition of the area.

Groundwater monitoring is required at both disposal facilities unless otherwise stated by the DOH. Location restrictions include prohibition from areas susceptible to flooding; in wetlands (except under certain conditions); near potable water supplies; near airports; near fault areas, seismic impact zones, or in any other unstable locations; and near tidal wave zones.

Neither MSW landfills nor C&D debris landfills may accept hazardous wastes or PCB wastes. Personnel should be trained to recognize hazardous wastes and PCB wastes. C&D debris landfills must adhere to operation procedures specified in the operation plan included in the permit application. Spotters are not required by the regulations but are required in the facility's operations manual, which, upon approval by the state, becomes part of the landfill's permit.

Final cover systems should be designed to minimize erosion and infiltration. The system for an MSW landfill should have a permeability less than or equal to the permeability of the bottom liner system or natural subsoils or no greater that 1×10^{-5} cm/sec. The layer to minimize infiltration should be made of earthen material and be at least 46 cm (18 in) thick. The layer to minimize erosion should be a minimum of 15 cm (6 in) thick of soil capable of sustaining native plant growth. The Department may approve an alternative final cover design. Financial assurance is required to cover closure, postclosure, and corrective action at both MSW and C&D debris landfill facilities.[18] Because of Hawaii's unique situation (islands and landmass) and the fact that

Downloaded By: [University of Illinois at Chicago] At: 13:40 16 October 2007

C&D debris is generally sent to landfills in Hawaii, a newly written guide, entitled *Minimizing Construction and Demolition Waste 3rd Edition*, assists in the development of recycling operations in the state.[19]

IDAHO

Idaho does not define C&D debris. Instead, waste is disposed in a facility according to its characterization. C&D debris composed of blocks, bricks, cement, and concrete is classified as *inert waste* and is exempt from solid waste regulation. This debris is often sent to rock quarries to be reclaimed, depending on individual county requirements. Other C&D debris composed of wood waste and gypsum drywall is regulated under solid waste rules. This waste is generally sent to a landfill (Tier II facility) for disposal. Large quantities of gypsum drywall might be sent to a Tier III facility, which follows MSW landfill rules with requirements similar to MSW landfill requirements. The types of waste generated at a C&D site determines the regulations that must be applied. For this paper, Tier II facility requirements will be reviewed, as the majority of C&D debris is disposed at such a facility.

Tier II facilities are not required to have liners or groundwater monitoring systems. Facilities are prohibited from contributing to the destruction of the critical habitat of endangered or threatened species; contaminating surface waters unless such waters are an integral part of the facility's operation for stormwater or leachate management; contaminating drinking water or groundwater, and locating in a 100-year floodplain, within 305 m (1000 ft) of any state or national park, wetlands, and geologically unstable areas. The active portion of facility may not be within 30.5 m (100 ft) of the property line. Operating training is not required. A spotter is not required, although the facility must have an approved method for identifying and handling unauthorized waste. Final cover consists of 46 cm (18 in) of compacted soil to minimize infiltration and a soil layer of 15 cm (6 in) to minimize erosion and sustain plant growth.[20]

ILLINOIS

Illinois defines *construction or demolition debris*, which is typically disposed at an inert waste landfill facility. Liners are not required, but leachate collection and monitoring are. All inert waste landfills shall be designed to include monitoring systems capable of collecting representative samples of leachate generated by the waste, using methods such as but not limited to a pressure-vacuum lysimeter, trench lysimeter, or a well point. Sampling locations shall be properly located to collect the least diluted leachate samples. Samples must be collected every 6 months and characterized for a suite of chemical parameters that provide indicators of contamination (organic chemical need to be analyzed every 2 years). If an inert waste landfill causes contamination or organics are detected in the leachate, the following will occur: (1) The facility will no longer be subject to inert waste landfill requirements of

Downloaded By: [University of Illinois at Chicago] At: 13:40 15 October 2007

Subpart B, and (2) the facility will be subject to requirements for Putrescible and Chemical Waste Landfills of Subpart C, including closure and remedial action.

Operators accept wastes for disposal only when accompanied by documentation that the wastes are inert based on testing of the leaching properties of the waste. Operators must conduct random load checking. Facility location should meet requirements under the Wild and Scenic Rivers Act and Clean Water Act. Location should not restrict flow in 100-year floodplain, adversely affect endangered species or critical habitat for such species, or violate requirements for area wide or statewide water quality management plan for nonpoint source pollution. Financial assurance is required.[21]

INDIANA

Indiana defines *construction/demolition waste* and *construction waste*. For C&D landfills, a soil barrier at least 60 cm (3 ft) thick with a hydraulic conductivity no greater than 1×10^{-6} cm/sec must separate the waste from a locally useful aquifer. If not, a synthetic liner may be required. Groundwater monitoring is not required because CESQG hazardous waste is not allowed to be disposed in the C&D landfill. Location restrictions include prohibitions from wetlands, critical habitats, floodways, karst, and over mines. Minimum distance requirements for waste disposal include 183 m (600 ft) from potable well or dwelling, 30.5 m (100 ft) from normal waterline within a floodplain, and 15.3 m (50 ft) from the property boundary. Operator certification is required. Final cover must be 60 cm (2 ft) thick within 180 days of closing. Financial assurance is required. Waste sent to recycling facilities is considered segregated waste unless 10% or more of the waste eventually goes to disposal; then the facility is classified as a transfer station.[22]

IOWA

Iowa defines *C&D debris, rubble*, and *rubbish*. A natural liner is required for non-MSW landfills. The liner must consist of at least four ft of recompacted soil with in-place permeability no greater than 1×10^{-7} cm/sec once in place. Groundwater monitoring is required. Location requirements are based on local siting and zoning specifications as well as general geologic and hydrogeologic criteria. Operator training is not required; however, spotters are recommended. The upper layer of final cover for the nonmunicipal landfill must consist of at least 60 cm (2 ft) of uncompacted soil with enough organic matter to support vegetation. The depth of this soil layer must be sufficient to prevent root penetration by planned vegetative cover into underlying soil layers. The lower layer of the cover must be at least 60 cm (2 ft) of compacted soil with permeability of 1×10^{-7} cm/sec or less. Compacted soil, incinerator ash, or similar material permitted by the Iowa Department of Natural Resources may be used to prepare the site for placement of this compacted soil layer, however, such material will not replace the compacted soil

Downloaded By: [University of Illinois at Chicago] At: 13:40 16 October 2007

layer. Financial assurance is not required. Although recycling is not required, a plan for waste reduction goals must be in place.[23]

KANSAS

Kansas defines *C&D debris* and *rubble* to include C&D debris. No liner system or groundwater monitoring is required for C&D landfills. Kansas is currently drafting new C&D regulations with new requirements, but not for a liner system or groundwater monitoring. An operating plan and operator training are required. Spotters are not required, but waste must be screened to ensure that only C&D waste is received. The final cover must be a minimum of 46 cm (18 in), including 30.5 cm (12 in) of compacted soil and 15 cm (6 in) of a vegetative layer. The current rules require a C&D landfill to be at least 0.8 km (0.5 mi) from a navigable stream. The new rules will have more comprehensive location restrictions. Financial assurance is required for closure and postclosure care.[25]

KENTUCKY

Kentucky defines *construction/demolition waste, construction materials*, and *construction/demolition debris landfill*. In addition to accepting C&D debris, a C&D debris landfill can accept other uncontaminated solid waste materials including metals, furniture, and paper. A C&D debris landfill is required to have a natural liner and leachate collection system. The natural liner must be at least 15 cm (12 in) thick soil with an additional soil component at least 15 cm (12 in) thick with permeability no greater than 1×10^{-7} cm/sec. This must be overlain by a 15 cm (12 in) drainage layer with a minimum permeability of 1×10^{-3} cm/sec. For C&D debris landfill facilities that exclude waste materials other than C&D debris, nonputrescible wastes, and wastes that do not leach or exceed environmental performance standards, the liner requirements are reduced to a minimum of 60 cm (2 ft) of recompacted soil without a permeability requirement, a drainage layer, or a leachate collection system.

Groundwater monitoring is required. Operator training is required and includes training for spotters. Facilities must maintain a minimum distance between waste disposal site and perennial streams; collapse zones of deep-mines or critical angles of draws; karst terrain features; property lines; residences; utility lines including gas, sewer, and water lines; unplugged wells except monitoring wells; airports; and fault areas. The liner bottom should maintain 1.23 m (4 ft) buffer above the seasonal high groundwater table. Facilities are prohibited in floodplains and unstable areas.

Final cover requirements for C&D debris landfills include grading to achieve a final slope between 5 and 25%, cover layer 15 cm (12 in) thick, and 30.5 cm (12 in) cap over cover layer with a maximum permeability of 1×10^{-7} cm/sec. The cap should be covered by a drainage layer 15 cm (6 in) thick with permeability of 1×10^{-3} cm/sec on slopes less than 15%. A system of drainage tiles should be in place to relieve water collected by the drainage

Downloaded By: [University of Illinois at Chicago] At: 13:40 16 October 2007

layer. An overlying filter fabric or other material shall cover the drainage layer, and a minimum of 91 cm (3 ft) of vegetative soil should cover the filter fabric. If the facility is limited to C&D debris, nonputrescible wastes, and wastes that do not leach or exceed environmental performance standards, the final cover need only be a minimum of 91 cm (3 ft) of vegetative soil. Financial assurance is required.[26]

LOUISIANA

Louisiana defines *C&D debris*, which is disposed in Type III landfills. A base layer of 60 cm (2 ft) of recompacted clay with 1×10^{-7} cm/sec permeability is required for the Type III landfill. Groundwater monitoring is not required. Geology determines location requirements; in addition, no standing water is allowed on site. Operator training is required and includes 10 hours annually with 40 hours every 4 years for recertification. Spotters may be required based upon the size and type of materials accepted at the landfill. Only non-contaminated materials are allowed on site, and landfills are inspected at least four times per year by the Louisiana Department of Environmental Quality (LDEQ). Final cover must consist of 60 cm (2 ft) of recompacted clay with 15 cm (6 in) of topsoil for vegetative cover.[29]

MAINE

Maine defines *construction, demolition*, and *construction and demolition debris*. *Inert fill* and *land clearing debris* (which do not include C&D debris) are defined and may be disposed within a C&D landfill. Neither a liner system nor groundwater monitoring is required; however, if natural in situ soils cannot accommodate all leachate production, then a leachate management system may be required. Operator training is voluntary, but spotters are required. A landfill may not be on undisturbed soil less than 1.5 m (5 ft) thick, undisturbed soil less than 91 cm (3 ft) above the seasonal high water table, 100-year floodplain, an unstable area, a coastal sand dune system, a coastal wetland, or a fragile mountain area. Minimum distances are required from the aquifer, public roads, property boundaries, nearest residence, stratified sand and gravel deposits, classified surface waters, water supply springs, and water supply wells. The landfill may not be located near a significant wildlife habitat or cover more than 2.4 ha (6 acres). The operating life is limited to 20 years, and final cover must consist of 46 cm (18 in) of clay covered by 15 cm (6 in) of soil suitable for vegetative growth. Financial assurance is not required. A waste management plan that minimizes landfilling of wastes and maximizes recycling must be in effect.[30]

MARYLAND

In addition to defining *construction, demolition*, and *land clearing debris*, Maryland defines *processed debris* to include C&D debris. A liner system consisting of both natural and synthetic materials is required. The natural component is composed of at least 30.5 cm (1 ft) of clay or other natural

Downloaded By: [University of Illinois at Chicago] At: 13:40 16 October 2007

material with in-place permeability no greater 1×10^{-7} cm/sec. The natural component can be substituted with (1) one or more unreinforced synthetic membranes with a combined thickness of at least 1.27 mm (50 mil) or (2) a single reinforced synthetic membrane with thickness at least 0.76 mm (30 mil) with a permeability less than or equal to 1×10^{-10} cm/sec. The synthetic liner must be installed over a 60 cm (2 ft) subbase, be free of objects that could damage the liner, and have a permeability no greater than 1×10^{-5} cm/sec. Groundwater monitoring is required at least semiannually. Operator training must be adequate to operate the site in accordance with the permit; spotters are not required.

Proposed landfill locations are evaluated by various state agencies as part of the review process described in the solid waste regulations. Final cover must consist of 60 cm (2 ft) of dirt placed within 30 days of closure, with a final cap constructed within 2 years. Financial assurance is required.[31]

MASSACHUSETTS

Massachusetts defines both construction and demolition waste and solid waste to include C&D debris. The regulations require a double composite liner system beneath landfills constructed with slopes of less than four horizontal to one vertical (<4:1). Other liner requirements are specific to slopes greater than 4:1. The double composite liner is constructed of a primary composite liner consisting of 30.5 cm (12 in) of a low permeability compacted soil layer/admixture (a hydraulic conductivity of 1×10^{-7} cm/sec) or a geosynthetic clay liner (GCL) overlain by a flexible membrane liner (FML), a leak detection and secondary collection system located between the primary and secondary liner, a secondary composite liner consisting of 60 cm (2 ft) of a low permeability compacted soil layer/admixture (a hydraulic conductivity of 1×10^{-7} cm/sec) or 30.5 cm (12 in) of a low permeability compacted soil layer overlain by a geosynthetic clay liner (GCL) and a flexible membrane liner (FML). Liner requirements may be less where MSW ash, C&D waste or other single source waste types are being disposed and characteristics of the waste such as permeability, leachate quality or other characteristics of the waste are considered. A leachate collection system and a storage system are required unless the collection system is directly connected to the sewer system. Groundwater monitoring is required. No operator training or spotters are required.

The location requirements include preventing location near public water supply wells or protection areas or where discharge from the facility could pose a danger to drinking water source areas. Waste may not be placed over the recharge area of a sole source aquifer unless no wells or water supplies or proposed wells or water supplies are downgradient of the site. Facilities are not permitted within areas where maximum high groundwater table is within 122 cm (4 ft) of ground surface or where a liner is designed to the satisfaction of the Massachusetts DEP, 122 cm (4 ft) of the bottom of the lowermost liner; wetlands; 100-year floodplains; areas where leachate discharge

Downloaded By: [University of Illinois at Chicago] At: 13:40 16 October 2007

would adversely impact groundwater; agricultural lands; areas where traffic impacts facility operation and constitutes a danger to public health and safety or the environment; areas where waste deposition would negatively impact endangered, threatened, or special concern species; ecologically significant natural community and state wildlife management area; state forests; and state or municipal parklands or conservation lands.

No site will be suitable if the anticipated emissions would not meet required state and federal air quality standards or constitute a danger to public health and safety or the environment. Minimum distance requirements include 30.5 m (100 ft) from waste handling area and property boundary; 305 m (1000 ft) from any occupied residence, health care facility, prison, school, licensed day care center, senior center, or youth center; 122 m (400 ft) from a lake; and 61 m (200 ft) from a riverfront area. Final cover should consist of a subgrade layer, gas venting layer, low permeability layer, drainage layer, filter layer, vegetative support or protection layer, and vegetative cover. Financial assurance is required.

While asphalt pavement, brick, and concrete recycling operations do not require permits if located at the site of C&D debris generation or at a quarry, facilities processing other debris components need a permit. Massachusetts requires a facility to recycle or compost 25% by weight of the average yearly amount of waste the facility may accept for disposal. This requirement may be met by any combination of the following activities: (1) The facility provides recycling or composting, (2) waste destined for recycling or composting is sent to a processor at a different site, (3) waste is diverted by the generator or intermediate handler to a recycling or composting facility prior to the waste being delivered to the landfill, or (4) the operator provides the opportunity to recycle or compost. The 25% may be reduced, deferred, or suspended if the operator cannot feasibly meet the requirement. The DEP may consider the following when deciding whether to adjust the requirement: (1) the effect of the requirement on existing waste disposal contracts, (2) the financial obligations of the operator, (3) the implementation costs at municipally owned facilities, and (4) the availability of nondisposal alternatives. The DEP also may limit the percentage of recyclable material that non-postconsumer recyclables assume.[32]

MICHIGAN

Michigan defines *construction and demolition waste*. A composite liner system is required. The lower component should consist of either compacted soil at least 60 cm (2 ft) thick or a bentonite geocomposite liner. The upper component should consist of at least a 0.76 mm (30 mil) thick FML installed in direct contact with the lower component. If HDPE is used, the minimum thickness required is 1.5 mm (60 mil). Leachate collection and groundwater monitoring are required. If the groundwater cannot be monitored, the landfill must have a leak detection system that is monitored. Operator training is not required.

Downloaded By: [University of Illinois at Chicago] At: 13:40 16 October 2007

Location restrictions include minimum distances from property boundary, environmentally sensitive areas, minimum distance from airports, floodplains, wetlands, fault areas and seismic impact zones, and unstable areas. Final cover should consist of a layer to minimize infiltration underneath a layer to minimize erosion. The layer to minimize infiltration must have 60 cm (2 ft) of soil either compacted or in conjunction with a FML. The minimum thickness for the layer to prevent erosion is 15 cm (6 in) of earthen material capable of supporting native plant growth. Financial assurance is required and is currently $20,000 per acre. Recycling facility requirements are covered under other permitting requirements.[33]

MINNESOTA

Minnesota defines *demolition debris* and *rubbish*. Liner systems are not required for demolition landfills. Although the waste materials approved for disposal in a demolition landfill vary depending upon the specific facility permit conditions, demolition landfills in Minnesota typically accept construction waste that is similar to demolition waste. Groundwater monitoring is conditional. The Minnesota Pollution Control Agency (MPCA) can require monitoring because of various criteria, including the type of waste accepted, site location and hydrogeology, length of operating life, size of facility, and potential for harm to human health or the environment. Operator training and certification are required. Although spotters are not required, a significant component of the operator training and certification involves identifying and spotting prohibited waste.

Minnesota has general landfill location standards and specific location standards for demolition landfills. General restrictions for new landfills prohibit location within floodplains, shoreland, river land if wild and scenic, wetlands, or areas where emissions of air pollutants would violate air quality standards. Specific location restrictions for demolition landfills prohibit location at a karst site or where the topography, geology, or soil cannot adequately protect ground or surface water. Final cover should prevent erosion of surface and side slopes, minimize particulate matter, and maintain vegetative growth. Financial assurance is not required unless the MPCA determines that financial assurance is necessary for the proper operation, closure, postclosure care, and corrective action because of size, site hydrogeology, operating life, or types of waste accepted.[34]

MISSISSIPPI

C&D debris is not specifically defined in the regulations. *Rubbish* and *industrial process debris* both include C&D debris, which is typically sent to a Class I Rubbish Site. A natural liner is required and may consist of naturally occurring low-permeability soil at least 1.53 m (5 ft) thick below the waste and 91 cm (3 ft) laterally from the waste. A buffer between the liner and the uppermost aquifer must be 1.53 m (5 ft) thick. Where a site cannot meet the natural liner requirements, an alternative constructed liner system may

Downloaded By: [University of Illinois at Chicago] At: 13:40 16 October 2007

be proposed. Groundwater monitoring is required under some site conditions. Operator training is not required. Although a spotter is not required, unauthorized waste must be identified and removed from waste loads.

Minimum distances are required from airports; public wells and public water supply surface water intakes; surface water bodies such as river, lake, or coastal water; parks and recreational areas; forests and wilderness area; wildlife management and natural areas; schools, hospitals, and other similar structures; and residences, roads, and highways. A buffer of 152 m (500 ft) from property boundary line or 76.2 m (250 ft) with adequate screening is required. Landfills are prohibited from locations where water flow in floodplains and from wetlands, locations above hydrocarbon wells and water wells water, locations that will affect endangered or threatened species, and historical and archaeological areas may be affected. Final cover should be 60 cm (2 ft) of earthen material in place within thirty days of completion of site activities. For sites that propose to collect and recycle C&D debris, a solid waste permit may not be required if only recyclable, inert rubbish wastes are collected. If collected wastes containing both recyclable and nonrecyclable materials are processed at a recycling facility, then a permit is required.[35]

MISSOURI

Missouri regulations define *demolition* landfills. A liner system composed of natural and synthetic components is required. The lower layer must be at least 60 cm (2 ft) thick compacted soil with a hydraulic conductivity of no more than 1×10^{-7} cm/sec. The upper component should be at least a 0.76 mm (30 mil) thick geomembrane (1.5 mm (60 mil) thick if HDPE). The upper component must be in direct and uniform contact with the compacted soil to minimize migration of leachate should a leak occur. Leachate collection and groundwater monitoring are required. The landfill must have a certified solid waste technician overseeing operations, but a spotter is not required. A landfill may not be located in a 100-year floodplain, seismically unstable locations, or wetland areas without demonstrating that the facility would not impact these areas. A final cover consisting of 15 cm (1 ft) of compacted clay, a geomembrane with permeability less than or equal to the liner membrane, and 60 cm (2 ft) of soil for a vegetative layer are required. Financial assurance is required.[36]

MONTANA

Montana defines *construction waste*, which is typically disposed in a Class IV landfill. A liner is not required for Class IV landfill if located within the groundwater monitoring network of a Class II (MSW) landfill. Liner requirements for Class IV landfills are dependent on site location and characteristics; however, groundwater monitoring is required. No restrictions other than the location determine the need for a liner. Spotters are required, but not operator training. Final cover consists of a layer to minimize infiltration, a layer to minimize erosion, and native plant vegetation. The layer to minimize infiltration

Downloaded By: [University of Illinois at Chicago] At: 13:40 16 October 2007

must contain a minimum of 46 cm (18 in) of earthen material with permeability no greater than 1×10^{-5} cm/sec. The layer to minimize erosion should be at least 15 cm (6 in) of earthen material capable of sustaining native plant growth. Financial assurance is not required.[37]

NEBRASKA

Nebraska defines *construction and demolition waste*. Nebraska has no requirements for a liner. Groundwater monitoring is conditional and can be required under certain site conditions. Operator training is not required, however unauthorized waste must be identified and removed. A 3 m (10 ft) vertical barrier must be maintained between the lowest point of the lowest waste cell and the maximum predicted water table elevation. The facility may not be located in a 100-year floodplain, wetlands, or unstable areas. Final cover for the landfill includes 91 cm (3 ft) of earthen material capable of sustaining vegetation. Final grades and side slopes of the closed area shall prevent erosion of the final cover. Operation, closure, and postclosure plans are required. Financial assurance is required for closure activities and for post-closure maintenance.[38]

NEVADA

Nevada defines *rubbish* and *industrial solid waste* to include C&D waste. A liner is not required if only these wastes are accepted, but the design of the landfill must sufficiently protect waters. Groundwater monitoring is required, although with a demonstration of no migration the requirement can be waived. Operator training and spotters are not required; however, a facility must have an approved waste-screening program. Both final cover and financial assurance are required for closure.[39]

NEW HAMPSHIRE

New Hampshire defines *construction and demolition debris* and *inert construction and demolition debris*. Materials that do not degrade or generate leachate are classified as inert and may be disposed in an unlined landfill. Unlined landfills must have groundwater monitoring, stormwater management, and a final cover system that is less stringent than those at lined facilities. All other C&D debris is sent to a C&D debris landfill, which requires a single liner system if the characteristics of the wastes are determined to not pose a threat to groundwater quality; otherwise a double liner system must be in place.

The single liner system is composed of the following components: a liner, a leachate collection and removal system, and a leak detection/location system. The liner may consist of either natural of synthetic materials. Natural liners should be at least 91 cm (3 ft) of recompacted natural soil with a hydraulic conductivity no greater than 1×10^{-7} cm/sec. Geomembrane liners should be at least 1.5 mm (60 mil) thick. Groundwater monitoring is required regardless of the liner system. Other requirements include operator training and spotters to inspect incoming waste.

Downloaded By: [University of Illinois at Chicago] At: 13:40 16 October 2007

Facilities may only be located where groundwater can be monitored prior to a release that may adversely impact the water supply. Minimum distances are required from perennial surface water bodies, wetlands, surface water reservoirs, roads and highways, airports, and faults. Facilities may not be located near shorelands or designated rivers. The bottom liner must be at least 1.83 m (6 ft) above the seasonal high groundwater table, and the waste must be deposited at least 30.5 m (100 ft) from the property line.

The final capping system for the landfill involves several layers. Fifteen cm (6 in) of unspecified soil that resists raveling or sifting should immediately overlay the waste. Above this layer is a protective layer of 30.5 cm (12 in) of sand. If a facility has an active gas extraction system, this layer need only be 15 cm (6 in) thick. A methane gas management system consisting of an impermeable barrier of either a geomembrane 1.02 mm (40 mil) thick or impermeable soils to minimize the infiltration of water into underlying wastes. The next layer should divert water that infiltrates the topsoil layer, be at least 46 cm (18 in) of free-draining sand with a saturated hydraulic conductivity no less than 1×10^{-3} cm/sec, and protect the middle layer from protrusion. The final layer should stabilize the capping system against erosion, promote evapotranspiration, and plant transpiration. This top layer should be at least 10.2 cm (4 in) thick, composed of topsoil, and fertilized and vegetated. Closure requirements include financial assurance.

New Hampshire also includes requirements for recycling facilities, including areas for waste receiving and inspection, waste sorting (if the facility sorts waste), hot load segregation and control, and waste storage. Stored waste managed as a recyclable material should be contained in a manner that preserves its market value. Recycling facilities should (1) provide access to all waste piles for fire control purposes, (2) limit stockpiles to heights compatible with local fire fighting equipment, and (3) provide a water supply that meets distance and quantity requirements of local fire fighting needs. All processed recyclable materials must be removed to an authorized facility prior to facility closure.[40]

NEW JERSEY

Most New Jersey landfills have double composite liner systems, but a Class III landfill has fewer requirements. Class III landfills accept inert, bulky, and vegetative wastes. New Jersey has a high rate of recycling C&D debris, but those wastes that are not recycled are generally disposed in a Class III landfill. For a landfill located in stable, low-permeability soil with a hydraulic conductivity of less than 1×10^{-6} cm/sec, the liner system must include at least 91 cm (3 ft) of clay or soil admixture with a hydraulic conductivity equal to or less than 1×10^{-7} cm/sec and a leachate collection system consisting of 30 cm (1 ft) of sand drainage layer with a hydraulic conductivity equal to or greater than 1×10^{-2} cm/sec.

Downloaded By: [University of Illinois at Chicago] At: 13:40 16 October 2007

If the location does not meet the low permeability soil requirement, a composite liner system must be constructed at a minimum consisting of a geomembrane liner over a 60 cm (2 ft) layer of compacted clay or admixture liner with a hydraulic conductivity of no more than 1×10^{-7} cm/sec. A landfill located in a geologic area with bedrock at or near the surface and serving as a direct source for a public community water system must have a double composite liner system. The primary and secondary geomembrane liners in the double composite liner system must be above a clay or admixture liner. A leak detection/secondary collection system must be located between the primary composite liner and the secondary composite liner. Groundwater monitoring and financial assurance are required.

Location requirements include protecting environmentally sensitive areas like flood fringe areas; wetland buffer areas; lands dedicated to agriculture or in farmland preservation programs; watershed areas for high-quality streams; lands near any lake, pond, river, or stream; and the designated pinelands protection area. Landfills must be designed to protect areas above cavernous limestone, dolomite, or marble or over subsurface mining activities; within 4.83 km (3 miles) from nearest runway; encroaching upon objects included in the Register of Historic Places; within buffer zone area of specimen trees as determined by the Division of Parks and Forestry, and with slopes exceeding 15%.

Each operator should receive initial training within 6 months of beginning work and annual training. The training program is described in detail in the regulations and should be directed by a person thoroughly familiar with the facility technology and permit conditions.

Final cover for the Class III sanitary landfill must consist of 60 cm (2 ft) of natural material with a permeability less than or equal to the bottom liner system or natural subsoils present, or 1×10^{-5} cm/sec, whichever is less. The cover depth must be at least 18 inches and overlain by at least 15.3 cm (6 in) of soil as a layer to minimize erosion. If a synthetic membrane is used in the bottom liner system, then the final cover must also include a synthetic membrane. Upon approval from the New Jersey Department of Environmental Protection (NJ DEP), an alternative cover scheme may be used. Financial assurance is required.[41]

At Class B recycling facilities (may be C&D debris), a 7.6 m (25 ft) buffer zone is required around the facility property. The recycling facility is also required to provide (to the NJ DEP) end market information for types and volumes of material recycled.[42]

NEW MEXICO

The New Mexico Environment Department defines *construction and demolition debris*. C&D debris includes *land clearing debris*; *clean fill* is composed of material from C&D activities. A liner system and groundwater monitoring

Downloaded By: [University of Illinois at Chicago] At: 13:40 16 October 2007

are not required if a landfill receives less than 22.7 metric tons (25 tons) per day. If the landfill receives more than that, it is classified as a municipal landfill and is regulated as such. A certified operator must be present during operations, but a spotter is not required. C&D landfills are prohibited in certain areas as specified in 20:9.1:303 of the New Mexico Administrative code and include location restrictions in natural, potable, historical, and archaeologically significant areas. Final cover must consist of a minimum of 60 cm (2 ft) of compacted soil, including 6 inches of topsoil. Financial assurance is required.[43]

NEW YORK

New York defines *construction and demolition waste, landclearing debris*, and *inert waste*. Long Island is located in a sensitive groundwater recharge zone, and therefore, landfills on Long Island are regulated somewhat differently than the rest of the state. Minimum requirements for C&D debris disposal facilities located outside Long Island are described here. A single composite liner with a leachate collection system is required. The composite liner must be a geomembrane with a minimum thickness of 1.5 mm (60 mil) that directly overlays an 45 cm (18 inch) soil layer (the top 15 cm [6 inch] having a maximum permeability of 1×10^{-7} cm/s). Groundwater monitoring is required. Location restrictions include prohibition from unstable areas, unmonitorable or unremediable areas, floodplains, primary water supplies, mines or caves, and bedrock with rapid or unpredictable groundwater flow. Minimum distances are required from airports. Operator training and waste spotters are required for all landfill facilities. The final cover must be composed of a gas-venting layer, a barrier layer or geomembrane, a barrier protection layer, and a topsoil layer. Financial assurance is required. C&D debris processing facilities have operator training, waste spotter requirements, and waste reuse and storage requirements.[44]

NORTH CAROLINA

North Carolina is currently developing new C&D debris rules. North Carolina does not currently require a liner system. The new rules will assess the attenuation properties of the underlying soils and evaluate the suitability of the soils for attenuation purposes. Although groundwater monitoring is not specified in the C&D landfill regulations, requirements are located in the solid waste rules. The Department of Environment and Natural Resources (DENR) may require groundwater monitoring depending on factors including the design of the facility, the type of waste a facility will handle, the geology of the area, and the proximity and usage of groundwater that may be affected by the facility. The DENR currently uses the regulatory monitoring requirements as a template for structuring the groundwater monitoring requirements for C&D landfills. Landfills are restricted from floodplains; areas where the facility may negatively impact the habitat of endangered or threatened species; sites

Downloaded By: [University of Illinois at Chicago] At: 13:40 16 October 2007

where archaeological or historical sites are at risk; locations that may impact a state park or recreation or scenic area; or land included in a state preserve. Operator training is not required. Although spotters are not required, a waste screening system must be in place to notify DENR within 24 hours if a nonauthorized waste is brought to the facility for disposal. Final cover must stabilize the site with native grasses within 6 months of final disposal. The proposed rules require financial assistance at closure.[45]

NORTH DAKOTA

North Dakota regulates *inert waste* landfills, which include wastes generated from C&D activities. *Inert waste* is broadly defined to include C&D debris, although C&D debris is not formally defined by the regulations. As natural clay-rich soils are readily available in most parts of the state, no formal liner system for inert waste landfills is required, although compacted clay may be necessary if the native soil is not adequate. Inert waste landfills are typically limited to those locations with clay-rich soils. Landfills are prohibited from areas that may be negatively impacted by the facility or affect human health or environmental resources, and from other locations that are unsuitable due to topography, geology, hydrology, or soils. Groundwater monitoring is not required. Operator training is voluntary, and guidelines for those programs are available from the North Dakota Department of Health (DOH). Spotters are not required. Final cover must be at least 60 cm (2 ft) thick with the lower portion consisting of 30.5 cm (12 in) of compacted clay. If compacted clay is not used, then the final cover must be at least 1.22 m (4 ft) thick and consist of clay-rich soil. Financial assurance is not required.[46]

OHIO

Ohio defines *construction and demolition* and *clean hard fill*. Although the following wastes do not fall under the definition for C&D debris, incidental packaging, tree limbs and trunks greater than 10.2 cm (4 in) in diameter, and NESHAP asbestos with a facility air permit can be accepted at a C&D debris landfill. If in situ soils meet the minimum thickness requirement of 1.53 m (5 ft) with permeability 1×10^{-5} cm/sec or have a maximum permeability equal to 60 cm (2 ft) of soil with permeability of 1×10^{-6} cm/sec, then no liner is required. Otherwise, a natural liner must be constructed of recompacted soil at least 61 cm (24 in) thick with a maximum permeability of 1×10^{-6} cm/sec. Groundwater monitoring is not required unless minimum distances from aquifer system, public water supply well, wellhead protection area, source water protection areas, and developed springs to the waste boundary at a facility are not met. At that point, monitoring is required to determine if the groundwater quality has changed.

Landfills are prohibited from placement above a sole source aquifer or in a floodplain. Operator training is not required. Although a spotter is not required, a daily log of material brought into the landfill must be maintained,

Downloaded By: [University of Illinois at Chicago] At: 13:40 16 October 2007

and each load must be taken to an unloading zone for screening prior to delivery to the work face. Final cover must include 46 cm (18 in) of a barrier layer, 15 cm (6 in) of fertile soil, dense vegetation, and a slope between 3 and 25%. If the site is to be developed into a parking lot or other purpose, other final cover requirements may apply. Financial assurance consists of $13,000 per acre and $2175 per monitoring well if present.[47]

OKLAHOMA

Oklahoma recently adopted the following definition for construction/demolition waste:

> (A) asbestos-free waste from construction and/or demolition projects that may include such materials as metal, concrete, brick, asphalt, glass, roofing materials, limited amounts of packing materials, sheetrock, or lumber;
> (B) wood waste that may include such materials as yard waste, lumber, wood chips, wood shavings, sawdust, plywood, tree limbs, or tree stumps;
> (C) yard waste that may include such materials as grass clippings, tree limbs, tree stumps, shrubbery, flowers, or other vegetative matter resulting from land clearing or landscaping operations; or
> (D) residential lead-based paint waste.[53]

A liner is required for C&D debris landfills. The liner may be a reconstructed clay liner with a minimum thickness of 91 cm (3 ft) and a hydraulic conductivity no greater than 1×10^{-5} cm/sec, or the liner may consist of in situ soils being a minimum of 1.5 m (5 ft) thick with a hydrulic conductivity no greater than 1×10^{-5} cm/sec. Groundwater monitoring is required. Location restrictions set limitations according to proximity to floodplains, airports, wetlands, endangered species, scenic rivers, recreation areas, terrace deposits, surface public water supplies, and public water supply wells. The Department of Environmental Quality (DEQ) must be notified the next day if any wastes are rejected as prohibited waste at C&D landfills or processing facilities. This requirement inherently requires spotting of the waste at any C&D facility. Final cover is a minimum 91 cm (3 ft) thick soil layer with a maximum top slope of 25:1 and a maximum side slope of 4:1. Vegetation must be grown on top of the soil layer. Financial assurance is required.[48]

OREGON

Oregon defines *construction and demolition wast. Clean fill, industrial waste, inert waste*, and *domestic solid waste* explicitly exclude C&D waste from their definitions. Depending on the location and the type of waste accepted, a liner system may be required. For instance, a small C&D landfill in western

Downloaded By: [University of Illinois at Chicago] At: 13:40 16 October 2007

Oregon, where the annual rainfall is high, is more likely to be required by the Oregon Department of Environmental Quality (DEQ) to install a liner system than an equivalently sized landfill in eastern Oregon, which is an extremely dry region. Groundwater monitoring is a conditional requirement. If the DEQ is not sure the groundwater will be safe from contamination, liner systems, leachate collection, and groundwater monitoring can be required. Operator training and spotters are not required, but facilities must screen the waste to comply with any permit prohibitions of certain wastes.

Nonmunicipal landfills are forbidden from locations that will cause harm to endangered or threatened species including plants, fish, and wildlife. Further limitations include floodplains and locations near sensitive hydrogeological environments. Final cover must include at least 91 cm (3 ft) of compacted soil graded to a minimum 2% and maximum 30% slope unless the department authorizes an alternative final cover design. Nonmunicipal land disposal sites must maintain financial assurance for the costs of closure, post-closure, and any required corrective action. C&D waste sites may be exempted from these costs if the site can be demonstrated to pose no threat to groundwater or public health and not require any operation or maintenance to control discharges into the environment.[49]

PENNSYLVANIA

Pennsylvania defines *construction and demolition waste* and *construction waste*. A liner system is required for C&D debris landfills. Each liner system must be composed of a subbase, a leachate detection zone, a liner, and a protective cover, which consists of another leachate detection zone, that are approved under the minimum liner design standards. The subbase should be a solid or other earthen material 6 inches thick with permeability no greater than 1×10^{-5} cm/sec. The leachate detection zone is placed on top of the subbase to collect and transmit any leachate entering the zone to a leachate treatment system. This zone should be at least 30.5 cm (12 in) thick and create a flow zone between the subbase and liner with permeability greater than 1×10^{-2} cm/sec.

Several options for the liner layer are allowed. The liner may consist of a continuous layer of remolded clay, geosynthetic material, or sodium bentonite placed on the leachate detection zone and be no more permeable than 1×10^{-7} cm/sec. The thickness of the layer is determined by the type of material; 60 cm (2 ft) for the clay liner, 0.76 mm (30 mil) for the geosynthetic liner, and 1 ft for the sodium bentonite liner. If the liner is a composite liner, then the upper geosynthetic component should meet the requirements independently of the natural component and vice versa. The final layer of the liner system, the protective cover and leachate collection zone, must be composed of at least 46 cm (18 in) of clean, earth material with a permeability of at least 1×10^{-2} cm/sec, allowing for the free flow of leachate. Groundwater monitoring is required. Spotters are required to monitor waste

Downloaded By: [University of Illinois at Chicago] At: 13:40 16 October 2007

brought to the facility, and a person trained in the weighing of waste must be present.

Facilities are prohibited from floodplains, wetlands, coal-existing areas unless operator owns mineral rights, valley, ravine, head of hollow, limestone, or carbonate formation. Facilities must adhere to minimum distance requirements from occupied dwellings, perennial streams, water sources, schools, and playgrounds, and waste must be 30.5 m (100 ft) from the property line. Facilities are prohibited from being an obstruction to air navigation.

Final cover includes a cap, a drainage layer, and compacted soil. The permeability should be less than or equal to the permeability of the primary liner or no greater than 1×10^{-7} cm/sec, whichever is less. The compacted soil layer should be at least 60 cm (2 ft) thick and placed on top of the drainage layer.

Financial assurance is required. The facility application should contain a plan for the salvaging and recycling waste materials for which recycling is cost effective. The plan should include proposed salvage areas, methods for salvaging, and anticipated markets for salvaged materials. The salvaging and recycling of materials may not be conducted unless the operator oversees salvaging and recycling operations to prevent interference with disposal operations and to ensure that all operations are conducted in a manner that prevents a health hazard or nuisance. In addition to these restrictions, all salvaged material should be moved promptly from the unloading area and either stored in an approved area or immediately transported off site.[50]

RHODE ISLAND

Rhode Island no longer has operating C&D landfills. By the end of 2000, only three operating landfills were in the state.[52] Although some C&D debris is disposed within the MSW landfills, most C&D debris is sent to processing facilities. These facilities are regulated under Rhode Island Code. The requirements for processing facilities are defined within state solid waste regulations and are similar to landfill requirements (e.g., monitoring requirements, location requirements, and operator requirements).

The Rhode Island Department of Environmental Management (DEM), depending on certain site characteristics, may require groundwater monitoring. Groundwater monitoring requirements depend upon the size, type, location, and length of storage of on-site waste stockpiles, as well as the proximity to public or private drinking wells, surface water, and wetlands.

Operator training is not required. Although spotters are not required, the facility must have an operating plan that includes methods for screening, handling, and removing of unauthorized waste. A buffer zone between the waste and the property line should be established to minimize dust, odor, and litter problems. Other location restrictions apply to waste being used as alternative daily cover or reused. Waste screenings from processed waste may not be used within certain proximity to surface water or wetlands or within

Downloaded By: [University of Illinois at Chicago] At: 13:40 16 October 2007

public drinking water supply, and a plan is required for monitoring maximum contaminant limits. Wood chips from land clearing debris may be used for landscaping mulch, soil amendment, sewer sludge amendment for composting, and erosion control material. Wood chips that contain segregated building or demolition wastes may only be used as fuel or erosion control projects at landfills upon DEM approval. Processing facilities are required to have financial assurance.[51]

SOUTH CAROLINA

South Carolina expects to revise its C&D rules within two years. No liner is currently required, but a landfill must have a minimum 60 cm (2 ft) soil barrier above the seasonal high groundwater level (i.e., the base of the landfill must be at least 60 cm (2 ft) above the seasonal high water table). Groundwater monitoring is not required. No certification for operators is necessary, although spotters must be present for waste screening purposes. Facilities may not be located in areas that would restrict the flow in a 100-year floodplain and in wetlands. Waste must not be disposed within 30.5 m (100 ft) of the property line. Minimum distances are required from schools, hospitals, publicly owned parks, drinking water wells, and utility equipment such as water, sewer, and power lines. The final cover must be composed of 60 cm (2 ft) of earth, have a 1 to 4% surface slope, and be graded to promote drainage. The side slopes of the cover should be no greater than 3:1. Financial assurance is required.[55]

SOUTH DAKOTA

State defines *construction and demolition waste*. No liner or groundwater monitoring is required. Operator certification is not required. Operators are required to maintain access control at disposal sites and conduct weekly site inspections. C&D debris disposal facilities may dispose of authorized waste (no asbestos or asphalt) in gravel pits or quarries. Location is restricted and should minimize significant adverse impacts to the public, surface water, ground water, wildlife, recreation, or aesthetic value of an area. Facilities are prohibited from a 100-year floodplain, unstable areas, or wetlands. The facility may maintain a buffer between itself and occupied dwelling, school, hospital, interstate or highway right-of-way, public park or recreation area, streams, creeks, lakes, reservoirs, or other bodies of water classified for fish life propagation. Final cover requires 60 cm (2 ft) of soil, an incorporation of contours into contours of surrounding area, and vegetation in accordance with Natural Resources Conservation Service (NRCS) recommendations.[56]

TENNESSEE

Tennessee defines *construction and demolition debris*, which is typically disposed in a class IV landfill. A liner system is not required, but a minimum 1.5 m (5 ft) layer of geologic buffer between the base of the fill and the

Downloaded By: [University of Illinois at Chicago] At: 13:40 16 October 2007

seasonal high water table of the aquifer directly under the waste must have saturated hydraulic conductivity of no more than 1.0×10^{-5} cm/sec. Location restrictions include minimum distances from streams and other water bodies. Groundwater monitoring is not required, although the Tennessee Department of Environment and Conservation (DEC) may require monitoring depending on the location of the facility. Operator training and spotters are not required, but permits generally require a storage container at the unloading area for removal and storage of any unauthorized waste. Final cover includes at least 76.2 cm (30 in) of compacted soil. The bottom 46 cm (18 in) must consist of a low-permeability layer covered by a 30.5 cm (12 in) vegetative layer. Financial assurance includes the cost of operating the facility for a 30-day period plus the estimated closure and postclosure care costs included in the approved care plan for two years after facility closure.

Recycling facilities must apply for a solid waste-processing permit. Facilities are permitted by rule, which means that they must notify the department of compliance with general operating criteria. Processing facilities for C&D debris are increasing in popularity, with 8 to 10 facilities currently operating. However, landfills remain the most viable option, with 50 to 60 active class IV landfills in the state.[57]

TEXAS

Construction and demolition waste contains waste resulting from construction or demolition projects; includes all materials that are directly or indirectly the by-products of construction work or that result from demolition of buildings, and other structures, including, but not limited to, paper, cartons, gypsum board, wood, excelsior, rubber, and plastics. Texas sends nonhazardous solid waste to several types of MSW landfills. Type IV MSW landfills may be authorized for the disposal of brush, construction-demolition waste, and/or rubbish that are free of putrescible, household waste, and special wastes. A liner system is required for Type IV MSW landfills. The liner may be composed of (1) at least 1.22 m (4 ft) of in situ soil with permeability no greater than 1×10^{-7} cm/sec between the deposited waste and groundwater or (2) at least 91 cm (3 ft) of compacted clay between the deposited waste and groundwater. The compacted clay liner must have at least 30 cm (1 ft) of protective cover after quality control testing and thickness determinations are complete. Groundwater monitoring is required except at arid exempt facilities.

Current location restrictions limit facilities from locating within 274 m (300 yards) of a public road unless the Texas Commission on Environmental Quality approves the proposed location. A new permit or permit modifications require compliance with the minimum distance restrictions or prohibitions from airports, floodplains, wetlands, fault areas, seismic impact zones, and unstable areas. As of January 1, 2004, operator training is mandatory. Spotters are required to direct unloading of solid waste. Final cover consists

Downloaded By: [University of Illinois at Chicago] At: 13:40 15 October 2007

of a layer to minimize infiltration and a layer to minimize erosion. The layer to minimize infiltration must be at least 46 cm (18 in) of clayey soil, classification SC or CL as defined in the "United Soils Classification System" developed by the U.S. Army Corps of Engineers, compacted in layers of no more than six inches to minimize the potential for water infiltration. A CH soil may be used; however, this soil may experience excessive cracking and must be covered by a minimum of 12 inches of topsoil to retain moisture. Other types of soil may be used with prior written approval. The layer to minimize erosion must be a minimum of 15 cm (6 in) of suitable topsoil capable of sustaining native plant growth and must be seeded or sodded immediately following the application of the final cover. Financial assurance is required.[58]

UTAH

Utah has no liner or groundwater monitoring requirements. However, if a C&D landfill accepts CESQG waste, groundwater monitoring is required and all location standards in the regulations must be met. If no CESQG waste is accepted, the location of the facility need only meet floodplain and wetland requirements and be at least 1.5 m (5 ft) above the groundwater table. With different requirements based upon the type of waste accepted, each landfill must ensure that the waste received is acceptable for disposal at that facility. Although not specifically required, a spotter completes this task. Final cover at a facility should have a minimum of 60 cm (2 ft) of soil contoured to allow runoff and seeded to prevent erosion. Financial assurance is required for closure and postclosure.[61]

VERMONT

C&D debris disposal falls under discrete waste disposal in Vermont. Under this classification, Vermont requires a double liner system composed of natural and synthetic material. However, the Vermont Agency of Natural Resources has the authority to waive liner requirements if a facility can demonstrate through a detailed site-specific hydrogeologic study and contaminant transport modeling that the waste components received on-site do not generate leachate that may cause harm to public health or the environment or create nuisance conditions. Groundwater monitoring is required. Facilities must detect any discharge of contaminants to surface water or air.

C&D landfills are prohibited from the Green Mountain National Forest, Class I and Class II groundwater area, Class I and II wetlands and buffer zones, Class III wetlands unless waved, national wildlife refuge, wildlife management area, threatened or endangered species habitat area, watershed for Class A waters, floodway, or 100-year floodplain, or near outstanding natural resource waters. Facilities should be located to not unduly harm the public health and to have the least possible reasonable impact on the environment if an emission or discharge occurs. Operators need to be experienced and knowledgeable, but no specific training is required. Requirements for final

Downloaded By: [University of Illinois at Chicago] At: 13:40 16 October 2007

cover vary depending on whether a facility has a liner. One C&D debris landfill in Vermont is constructed without a liner; as a minimum, its final cover is composed of at least 60 cm (2 ft) of earthen material with a permeability of less than 1×10^{-5} cm/sec or the facility base soils (whichever is less permeable), and at least 15 cm (6 in) of earthen material to sustain native vegetation. Financial assurance is required. Recycling is required and must include metal, cardboard, and other materials specific to the facility.[62]

VIRGINIA

Virginia defines *construction waste, demolition waste, debris waste, inert waste*, and *rubbish*. The type of landfill that accepts C&D debris is defined as a *Construction/Demolition/Debris landfill (CDD landfill)*. A CDD landfill accepts construction waste, demolition waste, debris waste, or combinations of the solid wastes just listed.

Either a compacted clay liner or a geomembrane liner must underlie the CDD landfill. The compacted clay liner must be at least 30.5 cm (12 in) in thickness, and must have a hydraulic conductivity less than or equal to 1×10^{-7} cm/sec. The geomembrane liner must be at at least 0.76 mm (30 mil) thick (1.5 mm (60 mil) if HDPE). In either case, a minimum slope of 2% must be maintained for leachate drainage, and the liner must be covered with a minimum 30.5 cm (12 in) thick drainage layer having a permeability not less than 1×10^{-3} cm/sec, and minimum 15.3 cm (6 in) thick protective layer.

Groundwater monitoring is required. The groundwater monitoring system must have at least one upgradient well, and three down-gradient wells. However, a double liner system can be used in lieu of groundwater monitoring. In this case, the lower, or secondary liner, must meet the same requirements as the primary liner. The double liner must include a 30.5 cm (12 in) thick drainage layer between the primary and secondary liner to serve as a "witness zone." The witness zone drainage layer must have a permeability not exceeding 1×10^{-3} cm/sec. While a double liner system can be used, it should be noted that no CDD landfill has been built with that design.

Operator training, which includes the implementation of an unauthorized waste control program, is required. Location restrictions for CDD landfills include prohibitions from areas susceptible to flooding, geologically unstable areas, and minimum distance requirements from any residence, school, hospital, groundwater source of drinking water, and wetlands.

Final cover must consist of an 45.7 cm (18 in) thick layer of earthen material with hydraulic conductivity less than or equal to the hydraulic conductivity of any bottom liner system, or natural subsoils present, but in no case no greater than 1×10^{-5} cm/sec to minimize infiltration. A minimum 5.3 cm (6 in) thick layer of earthen material capable of sustaining native plant growth is required on top to minimize erosion. Financial assurance is required.[63]

Downloaded By: [University of Illinois at Chicago] At: 13:40 16 October 2007

WASHINGTON

The regulations define *demolition waste* and *inert waste*. C&D debris is typically disposed in a limited purpose landfill, which, unless exempt, requires a composite liner system. A 3 m (10 ft) barrier must exist between the lowest component of the liner and the highest seasonal level of groundwater. The lower component of the liner should consist of a minimum 60 cm (2 ft) layer of compacted soil with hydraulic conductivity of no more than 1×10^{-7} cm/sec. The upper component must be a geomembrane made of HDPE with minimum of thickness of 1.5 mm (60 mil). The facility must have a leachate collection and monitoring system capable of maintaining less than a 1 ft head of leachate over the liner system. A limited purpose landfill may be designed and constructed without a liner system if it can be demonstrated that (1) contaminant levels in waste and leachate are unlikely to adversely impact the environment, (2) in situ soils provide a sufficient barrier or are capable of reducing the concentration of contaminants sufficiently to meet performance standards, and (3) explosive gases are not generated in concentrations above state limits by the facility.

Groundwater monitoring is required. Operator training is required and includes identification of unauthorized waste. Spotters must ensure that no liquids or liquid waste are disposed at the facility and must follow an established random inspection program. The facilities may not be located on Holocene fault. The facility must adhere to minimum distance requirements from structures and natural areas including water supplies; channel migration zones such as streams, lakes, ponds, rivers, or saltwater bodies; wetlands or public lands; and airports.

Final cover should consist of a geomembrane overlain by an anti-erosion layer. The geomembrane should be at least 0.76 mm (30 mil) thick. The anti-erosion layer should be earthen material at least 60 cm (2 ft) thick with the upper 30 cm (12 inches) capable of sustaining native plant growth. Financial assurance is required. Recycling facilities may accept source-separated C&D debris. Other recycling restrictions are specified within the permits.[64]

WEST VIRGINIA

West Virginia defines *construction and demolition debris*. No liner, groundwater monitoring, operator training, waste spotters, or financial assurance at C&D landfills is required; however, facilities are prohibited from locating in areas where the facility could adversely impact the environment. A facility is limited to 0.81 ha (2 acres) and may only be as high as an existing, adjacent contour. Facilities are restricted from locating near wetlands, areas harboring endangered or threatened species, areas where facility may significantly affect surface or groundwater, floodplains, highways, public parks, dwellings, airports, fault areas, mines, and other unstable areas. Final cover

Downloaded By: [University of Illinois at Chicago] At: 13:40 15 October 2007

should include 61 cm (24 in) of clean earthen material over the fill area capable of sustaining plant growth.[66]

WISCONSIN

Wisconsin defines *construction* and *demolition debris*. Wisconsin places C&D landfills into two categories: small-sized C&D landfills and intermediate-sized C&D landfills. The minimum requirements, which apply to the small-sized C&D landfills, are discussed unless otherwise noted. A clay liner at least 91 cm (3 ft) thick is required with a hydraulic conductivity of 1×10^{-7} cm/sec or less when compacted. A 3 m (10 ft) barrier should exist between the seasonal high groundwater table and/or bedrock and the bottom of the liner. Groundwater monitoring and operator training are required. A waste-screening plan must be in place and for intermediate-sized landfills must include training personnel in the identification of unauthorized wastes. Minimum distance requirements must be maintained from any public or private water supply well; any navigable lake, pond or flowage; any highway, interstate, or public park unless the landfill is screened; and any navigable river or stream. A landfill is not permitted in a floodplain. Final cover should include 60 cm (2 ft) of compacted earth with an adequate slope for water runoff covered by 15 cm (6 in) of topsoil. Financial assurance is required.[67]

WYOMING

Wyoming defines *construction/demolition waste*. A liner system and groundwater monitoring are generally not required; however, groundwater monitoring may be required on a case-by-case basis depending on site characteristics. Operator training is required, although a spotter for identifying unauthorized waste is not.

Location restrictions include minimum distance requirements for facilities greater than 0.41 ha (1 acre) in size, including distances of 1 mile from a public school, occupied dwelling house, and boundaries of an incorporated city or town, and 0.8 km (0.5 mile) from the centerline of the right-of-way of a state or federal highway (unless screened) and from water wells. Minimum distance are required for any size facility from an occupied dwelling house, school, hospital, interstate, primary highway, public park, or recreation area unless screened; water source; buildings unless protected from methane gas accumulation; perennial river or stream unless the facility will not affect it; and perennial lake or pond unless the facility will not affect it. Facilities are prohibited within a 100-year floodplain, wetlands, areas where facility may diminish the scenic, recreational, and fish and wildlife values for any section of river designated for protection, areas where a threat may be posed to an irreplaceable historic or archeological site, critical habitats of endangered or threatened species or winter ranges for big game or breeding grounds for grouse, areas where facility may negatively affect surface water

Downloaded By: [University of Illinois at Chicago] At: 13:40 16 October 2007

or groundwater quality, and areas determined to present a dust, odor, or public nuisance potential. Final cover consists of a compacted layer of soil 60 cm (2 ft) thick covered with at least 15 cm (6 in) of topsoil. Financial assurance is required for commercial or private landfill facilities but not municipal facilities.[68]

CONCLUSIONS

Issues involving C&D debris have recently become more of a concern than they traditionally were in the past. Since no federal definition or management requirement for C&D debris exists, this waste stream is handled individually by each state. The survey results presented here found that the definitions and regulations that states apply to C&D debris are not consistent. Almost half of the states have some sort of liner requirement for C&D landfills, indicating that these states do think C&D disposal could have an impact on the environment. However, the lack of consistent liner and groundwater requirements among states suggests that states may be unclear about the environmental risk of C&D debris disposal in landfills. Federal regulation or guidance could standardize the level of environmental protection for these landfills. As more information is learned on the fate of compounds found within C&D debris, the need for federal guidance on this waste stream may arise. At the least, a federal definition of C&D debris would be beneficial to facilitate research efforts and to address this issue in a more uniform manner.

Subject: Proposed CES Permit in Palmer

HANDOUT

To Whom It May Concern,

I am writing to strongly suggest the denial of the proposed permit by Central Environmental Services for an unlined dumpsite in the Kepler/Bradley Lakes Recreation area. There is too much risk not only for the recreational areas but also for the surrounding residential areas that have wells as their primary source of water. We need to make sure that we are doing what we can to keep the water supply in the area clean.

Sincerely,
Heather Maidl

Subject: Request to the Borough Assembly to deny dump permit for toxic waste

Hello Susan,

Please accept this as a request to the Borough Assembly to deny the dump permit for the monofill dump proposed by CMS.

This site is a terrible location for a monofil in the whole Matanuska-Susitna Valley because it sits on top of a massive aquifer that feeds our lakes and provides drinking water. People with wells that are connected to the aquifer will not have confidence in drinking the water that once had no threat of pollution. The Kepler/Bradley Lake Systems and and Matanuska Lake Recreation area will be under threat of irreversible contamination. Local residents and tourists alike enjoy fishing in the pristine unpolluted waters in the rivers and lakes in the close surrounding area. When the lakes are contaminated it could pollute the fragile eco system and kill fish, waterfowl, birds of prey and wild life that live around and in the lakes. We have nesting eagles and osprey hunting in this region.

Munter's hydrology report predicts potential for well contamination in a 1 mile down-gradient direction from the source. This report cannot be ignored and implies serious consequences for home owners, real estate prices and the health of the population.

Please make sure this message gets presented to the assembly, thank you.

Sincerely,

Peter & Evelyne Schadee

Subject: Request for Jim Munter to be present at Dec. 15 Planning Commission hearing

Hi Folks,

I'd like to request that the borough ask J.A. Munter to be present at the planning commission hearing this coming Monday, Dec. 15 for the discussion of the Conditional Use Permit request from Central Monofill Services for a dump site at Mile 38.3 of the Glenn Highway. Specifically so that there is a clear record on his reports and to be available to answer any questions that may come up related to his hydrology reports prepared for the Mat-Su Borough. The hydrology of the site is a key factor for the commission to consider in determining whether this site has the potential to harm public health, safety, and welfare. Having Mr. Munter available to answer questions is in the interest of having as accurate and complete a record as possible. Mr. Munter was able to present his latest findings at the last meeting, but two commissioners were absent from that meeting and were not able to ask questions of him.

- Stephanie

To: "slee@matsugov.us" <slee@matsugov.us>

HANDOUT

Hello,

Please include this email in public statements regarding the CMS permit request for a Monofill.

I live at 2650 S Skyranch Loop in Palmer. I am against granting any permit for the proposed CMS dump.

-The borough hydrological report was unfavorable. I have young children in my home and we do not have confidence in the science of the other three reports. Adverse environmental conditions of the area, a water table that is a moving target and past breeches of the aquifer are a few of the reasons I request the borough and DEC be very careful with the water that my family drinks (we have well water). We cannot be sure the quality of the water would not decrease and it certainly wont improve according to the scientists that conducted the borough's hydrological report, therefore, I ask for a conservative approach to granting a permit next to residential and recreation areas as stipulated in the Resource Conservation and Recovery Act.

-Beaufort Scale can be found at the attachment. Although the presentation is a cartoon depiction of the effects of wind, the scientific standards are known and widely accepted. Please ensure the planning commission and AK DEC both review this prior to making any decisions on dumping and allowable wind speeds. Also note that This cartoon and analysis indicate 20mph is a no-go and also that planners should locate and zone for this type of development to the NW side of the valley rather than the southern inhabited portion of the valley because of the Matanuska and Knik winds. Notice at 20 mph winds are much different than 10 mph. http://www.howtoons.com/?page_id=150

-Please review the wind research on the Matanuska Valley at this link:
http://www.nws.noaa.gov/oh/hdsc/Technical_papers/TP27.pdf

Beginning on page 17 in the scientific research of Robert Dale (The Climate of the Matanuska Valley), the Matanuska and Knik winds are discussed at length. One can note that the proposed site of the dump is almost dead center in the worst wind-driven area of the valley. The reader will also note that the winds are sometimes greater than 60 mph and, referring back to

the Beaufort Scale, the devastation is significant... no way a fence keeps blowing debris from our neighborhoods and recreation areas in these environmental conditions. Suggest the better place for this type of business is away from the watershed, neighborhoods and recreation area. We can be certain that dust, metals, acid gases and other volatile compounds would become airborne in the Matanuska and Knik winds of significance despite claims that a fence will prevent dust from escaping the land owner's turf.

-Please also consider the ambient air quality standards that we currently value and the potentiality for the air quality to be adversely impacted. Odor pollution is likely to occur in the dump and, yet another, reason to deny the permit in this fragile ecological zone. Although we cannot measure odor pollution until there are odors and the air quality decreases significantly, we can be sure the wet materials will decay. Again, a better location is the NW of the Valley where the winds are not as significant and the monofill can be isolated from residential and recreational areas.

-There is not enough evidence to prove the dump will not leach into the seasonally moving water table. My family and I depend on the water underlying the proposed dump and accepting any potential decrease in our water quality is unacceptable. There is enough scientific evidence to support denying the permit because of the risk of water contamination.

In summary, I oppose the dump because of the location in a watershed used in residential area; the proximity to our recreation areas; the hydrological survey indicates significant risk to the watershed; winds in the area make the location unsuitable and air quality effects that will, likely, occur.

HANDOUT

Susan, I would like to submit for the record the following case summary in two parts from the Borough, it seems to contradict the testimony of some of the CMS employees and clearly shows household trash included in CMS's "product" illegally dumped at the proposed site. It also shows CMS's disregard for water bodies on site that they chose to fill with garbage.

Notes:

On 4-25-13 Our office began receiving complaints from Craig Stevens, Kelly Ballard, and Matt Chambers about the proposed Monofill site located on parcels 17N02E18C010 & 17N02E19B006. Planner Susan Lee also received a phone call from Central Monofill Services (CMS) representative, Shane Durand. Per Susan's memo, Shane informed her they have drill 3 of 7 monitor wells, brought wood to chip and mix with their daily cover material (shredded C&D material smaller than 2 inches in size). Also per the memo, Shane noted they have not brought on any "fill" material yet.
4-26-13 @ approximately 1428 hours, I arrived at the proposed monofill site. I observed a large amount of tires for industrial equipment. They were stacked 3 to 4 high in a line. There appeared to me close to 100 tire. Near the wall of tire a bulldozer was being operated due to the terrain and tires I could not see what it was doing. I also observed other equipment and a commercial CEI semi-truck vehicle with hauling trailer/container attached. There was a second trailer/container adjacent to the semi & trailer. There was also what appeared to be a fuel storage tank and two commercial vehicles. CCO Mark Whisenhunt

Inspector: ***MARK WHISENHUNT*** Check Out:

Contact Date: 04/29/2013

Notes:

4-29-13 Richard Harbuck contacted our office in reference to trash being blown around his neighborhood from the trash material CMS brought to the proposed monofill site . He informed me that the he has photos of CMS employees burying the material, and that a lot of trash and Styrofoam was blown from the property during a small wind event.

At approximately 1145 hours, I called private property owner Bernard "Ben" Vanderweele. There was not answer so I left a message asking to be contacted back. I also asked for permission to access his property to investigate the un-permitted work done by CMS.

At approximately 1230 hours, I called CMS point of contact Shane Durand @ 350-6062. There was no answer so I left a message asking to be contacted back in reference to the work being done without a permit. At approximately 1300 hours, I found a voicemail from Mr. Durand noting he was traveling back from Florida and that he was boarding a plane momentarily. I tried Mr. Durand's number again and it went straight to voicemail.

At approximately 1345 hours, I drove past the gate and saw that it was closed. I then arrived at 3251 S. Colleen Street, the Hall residence. I was not able to contact anyone at the residence so I left me card at the front door. I then proceeded to 2301 S. Colleen Street the Davis residence. I made contact with Donna and Joshua Davis. I asked if they had been affected by the activities at the proposed monofill site. They noted the large amount of trash blowing around and well as the noise and vibration from the equipment. Donna expressed concerns about the monofill activity and how they did not received any public notice for the activity.

I explained that we were in receipt of an application and that the public notice mailing would be going out soon. I also noted that CMS was not permitted to bring the junk and trash items onto the property and that I would be taken further actions to have CMS abate the violation. Josh then walked me to the end of their property that abuts the proposed monofill site. I took photos of the site from the private property. I observed a bull dozer working. I also observed about appeared to be a gray processed material but I could not make out what it was made of. Josh noted that the gray material is what contained a large amount of Styrofoam and trash, which is where the trash blown about came from. I also observed the wall of tires previously mentioned and a large pile of scrap wood next to a barrel-chipper. There was also a large pile of wood chips too. From Colleen Street, I observed what appeared to be a large amount of litter throughout the utility easement. This utility easement leads to the area of concerns.

At approximately 1435 hours, I arrived at the proposed monofill site. The from gate was still closed so I did not proceed onto the property.

Upon return to the office I found a voicemail from complainant Sarah Hall in reference to the proposed monofill site. She noted that she and her husband were filing a complaint. I then found a complaint for from Adam Hall in reference to the unpermitted work being done at the permit monofill site. Planner Susan Lee received a complaint from Mr. Harbuck as well.

At approximately 1505 hours, I made contact with Stuart Jacques, CMS/CEI President/Director via phone. Stuart noted that they have hauled some "daily cover" (AKA screened fines and/or topper) material. I noted that we were receiving complaints of trash blowing from the property and he stated that he was aware some stuff had blown from the property but noted most of it was not, and was there previously. Stuart stated that he was sending a crew out to clean up the trash on 4-30-13. I mentioned my site visit, and that it appeared the screened fines were being buried. Stuart was adamant that they were not burying the material but that they were mixing. I noted that all activities related to the proposed monofill must stop. Stuart seem argumentative, saying they could store the tire on site and process the wood. Noting the wood would be used for multiple things including bio-fuel, and the tires will be used for the retaining walls. I informed Stuart that our office would be issuing an enforcement order addressing our concerns and the violations on site.

4-30-13 Investigation revealed CMS does not have a Matanuska-Susitna Borough Business License. I also talked with Adam Hall via phone. I informed him of my actions to date and that the investigation is continuing. I also noted that it was our intension to issue an Enforcement Order to stop the violation's of MSB Code. Adam expressed additional concerns about work done to the dam between the Westside dredge lake and the center lake. He stated that portions of the dam was removed and large armor rock was put in, allowing water to flow through the armor rock. I gave him contact information for SOA Dam Safety employee Charlie Cobb.

I then contacted Charlie Cobb (748-2942). Charlie noted that he and the CMS came to an agreement to deregulate the dam. Charlie issue a "certificate of approval" for CMS to place the armor rock, and let the waters pass through. I expressed concerns for possible negative affect to canoe lake

and asked if they were monitoring the lake. Charlie noted they were not required by law to do so. I then relayed my conversation to Mr. Hall.

5-1-13 I called Nathaniel Emery of ADEC (269-7590). I left a message asking to be contacted back in reference to CMS. I noted that we were issuing an Enforcement Order (EO) to stop work on site and abate the violations.

5-1-13 @ approximately 1425 hours, I made contact with Shane Durand (Authorized agent on CUP application/Secretary, Treasurer) of CMS. I informed him of the complaints and asked about activities on site. He noted that monitor wells were put in about 10 days earlier. He also stated that there was a verbal altercation between some neighbors and some of his employees about access. Shane stated that he was told it was a heated altercation.

Shane went on to say that the wood processing did need a permit and that the tires were not waste because they were be used as retaining walls, being sold, and would block the trails. Shane said if they used the tires as barriers at the utility easement that they would sold the litter problem, because the tires would catch and stop the flying debris.

I asked Shane what materials the daily cover contained. He confirmed that it had small plastics such as vapor-barrier items. He also noted that it is called "screened fines" because it consists of items less than two inches in size, and that the fill material for the site will be greater than 2 inches in size. Shane said uses for the screened fines are a daily cover, site reclamation cover, mixing into road bed material. He noted that the screened fines were to be mixed with earth material and tested for compact-ability.

Shane has concerns for taking steel to the site that will be used to built their shop. I noted that as long as it was not scrap material, it would be no different than staging a site. To build.

Shane also noted that the wood/wood chips will be used for compost, and to heat the shop. He said he called and got a verbal "ok" from either Pamela Ness or Susan Lee (Pam Noted she didn't speak with him about it. Susan and Alex stated the informed him not to bring the wood out for processing without getting the CUP first).

I informed Shane that we had issued an EO and that I would like to meet with him to discuss it. I noted the requirements. We agreed to meet at CEI on 5-2-13 @ 1300 hours. MWhisenhunt
mw03583 - 5/9/2013 11:11:06 AM

Inspection ID: **20575**
Inspection Date: **5/2/2013** Status: **c**
Inspector: ***MARK WHISENHUNT*** Check Out:
Contact Date: **05/02/2013**
Notes:

5-2-13 I found a voicemail from 5-1-13 by Stephanie Nowers in reference to her concerns of "dumped material trash tires etc.. at the "Gravel pit". I called back and left a message asking to be contacted.

5-2-13 at approximately 1014 hours, I called Shane @ 350-6062. There was no answer so I left a message noting I would be conducting a site visit prior to our meeting. I later found a message from Shane noting the site visit would not be a problem and that the gate was open.

At approximately 1048 hours, I arrived at the Hall residence. I was not able to make contact with anyone, so I left a thumb drive for them to load their photos onto.

I then stopped on Colleen Street and the utility easement. I observed what appeared to me a large pile of full trash bags. At approximately 1055 hours, at arrived at the proposed monofill site. I observed the large about of wood and tires mentioned previously.

I proceeded to the area of the screened fines located at the southern portion of the proposed monofill site. There were a tracks on what appeared to be a constructed road thru the site. This constructed road was littered with debris such as Styrofoam, carpet, and various types of plastics. I proceeded to the utility easement area and found a large pile of trash bags, some white some black. The white ones appeared to be filled with trash and leaf debris. I did not go into the wooded area to check to see if the private property was cleaned but, the immediate area was clean.

I then proceeded back to the dump site area. Upon looking closer at the material I notice house-hold garbage items riddled throughout the screened fines material. I took photos of a few of the house-hold garbage items such as: nestle chocolate chip bag, conditioner bottle, 5 hour energy drink bottler, Q-doba restaurant bag, animal crackers box and more.

The screened fines were pushed into an adjacent water body. I not sure if this is a temporary (run-off) water body or otherwise. When I stepped near the edge of the trash and water, the trash under my feet began to sink, so I immediately stepped back away from the edge area. I was able to observe the screened fines under the surface of the water.

There was a clearly defined layer of screened fines material and then a clearly defined layer of earth material over the screened fines. There were smoothed areas on the earth material that made it appear to be "back-bladed". This is a process setting the bucket or blade of heavy equipment down and pulling it backwards to smooth and compact an area. This leads me to believe the screen fines are being buried.

The west/southwest shore of the water body was covered in trash and litter. It appeared to be Styrofoam and other litter from the screened fines material. I also observed a male and female mallard ducks. They were in shrubs of the western shoreline until I approached the eastern (screened fines side) of the water body. They flew over to the wood pile and then flew in the area of the dredge ponds.

I then observed large water pump on the north side of the tires. It was not currently running but it still had its suction hose in the water body with the screen fines. Its output hose lead to an area just south of the most western dredge pond. The area at the end of the output hose was drying up but it appeared to have been draining into the western dredge pond.

At approximately 1315 hours, I made contact with Shane Durand in person. I served EO2013-002, and explained the requires of the EO and his right to appeal within 21 calendar days. Shane noted he didn't have a problem with complying, but was concerned with the having to remove all of the screen fines from the property be cause is was covered with gravel.

I asked Shane why the decided to bring material to the site prior to obtaining the permit. He stated that he just got back from training and he found that the screened fines can be used for mixing into road beds and used as cover for reclamation of land. His said his intent was to mix the material with gravel at different ratios and have them tested for compact-ability and leaching properties. He planned to take the test data to the public hearing. Shane also noted that they didn't have the room in anchorage and that the proposed monofill site seemed the logical choice. Shane also mentioned that to mix the material the layer two feet of screened fines, then cover it with two feet of gravel. Finally they use the multi (or single) shank ripper on the back of the bulldozer to mix. Shane did not know how many tons or cubic yards of screened fines were taken to the proposed monofill site.

Shane also confirm they were pumping the previously mention water body in the dredge pond. While speaking of the dredge ponds he mentions some people were confused about their proposed operation, because they think CMS will dump haz-mat into the dredge ponds. He continued talking about the pond and they were sure what to do with them yet. He later noted that if there was any type of pollution, it would be a big issued because there was a large of amount of water flow sub-surface. He then said "I hate to say this but, the solution to pollution is dilution."

I asked Shane if CMS was the same company as CEI. He said no that they are two stand alone

companies, but were under the same ownership. I then let him know that CMS did not have a MSB Business license. He had the MSB business license application complete prior to me leaving his office. CCO Mark Whisenhunt
5-3-13 I found a voicemail from Ben Vanderweele. He gave me permission to access his properties to investigate the case. I also received a call from Mr. Harbuck. He noted he was concerned with CMS pumping water in the water table.
5-6-13 I made contact with ADEC employee Nate Emery. I educated him on the enforcement order. He noted that they were not issuing the permit until the CUP process was complete.

@ approximately 1217 Brent Andrews of SOA Div. of Water contacted me via phone. He asked if I could issue an order to stop CMS from pumping the trash water in to the dredge pond. I informed him that I would not enforce state code, and that I did not have enough evidence to show a public health hazard. Brent expressed concern for potential negative affect to Canoe Lake. I gave him contact information of SOA Dam Safety Charlie Cobb. I noted I thought it may be important to talk with Mr. Cobb since Mr. Cobb issue a Cert to change the dam on the property. Brent also noted that CMS were not authorized to dewater the site and should let it evaporate/dissipate. I later received an email from Mr. Andrews saying he found a permit for the site from 2009 issued to the prior owner.

At approximately 1426 hours, I sent an email to Mr. Emery, Mr. Andrews, and Mr. Cobb. I attached the Hydrologic reports of Brailey and Munter as well as a copy of my EO. I also noted that I it may be valuable to for Mr. Cobb and Mr. Andrews to talk further about the Concerns for Canoe Lake. Mr. Emery emailed me back noted he used a hydrologic report from TERRASAT Inc. which was completed in August 2012, and establish the depth of the groundwater in January 2010. He also noted "Engineered plans for the site do show a little bit of fill to bring the bottom of the cell to the appropriate grade. This fill was never requested nor approved to be constructed with any waste materials."
5-7-13 I found that six more complaints were filed by: Vincent and Tricia Volpe, Joshua Davis, Kyla Davis, Alia Davis, and Jeffrey Davis.
5-8-13 Our office received a complaint from Peter Rowe. It noted concerns of polluted water, and dumping and burying industrial waste. I also received notice from finance that CMS now has a business license. Planner Susan Lee forwarded an email from Shane to me. It noted that they were holding an informal public meeting on 5-14-13.

P&LU Department Director, Eileen Probasco informed me she was contacted by Mr. Durand. She stated he informed her that they were almost done cleaning and removing the screened fines and that a truck broke down so they are running behind, but should be done in a couple of days. She also stated that they were hauling the material to the borough land fill.
5-9-13 Mr. Harbuck came into the office and noted that the screened fines are being buried. He also submitted a Public records request. I also spoke with Adam Hall via phone. . He noted that he has pictures of CMS burying the screened fines. He also stated that he got a visit from the Troopers because somebody reported him trespassing and showing a firearm. 'Valley Trash' is a joke, not a business model

By Stephanie Nowers | Posted: Thursday, December 11, 2014 7:22 pm

The proposal by an Anchorage company, Central Monofill Services, to dump hundreds of thousands of tons of shredded construction debris and asbestos in an unlined, privately operated dump next to the Kepler-Bradley Lakes area near Palmer raises serious concerns. The proposed dump — which is up for consideration by the Mat-Su Borough Planning Commission on Dec. 15 — threatens to pollute the surrounding lakes and the aquifer that feeds area wells. It poses a threat to air quality from asbestos and from hydrogen sulfide gas created by rotting drywall, a problem well documented at similar facilities in other states. It also threatens to create a financial liability for the borough as taxpayers will be on the hook for funding any clean up. According to applications filed with the borough and state, Central Monofill has offered to put up a total of $5.5 million in insurance and bonding — literally a drop in the bucket when it comes to cleaning up a polluted water supply.

As proposed, Central Monofill proposes to dump up to 25,000 tons a year of construction debris and up to 10,000 tons a year of asbestos. The site would cover up to 35 acres over a 25-year period with construction debris and asbestos piled up in cells up to 75 feet high that would use baled tires for the cell walls. The company has proposed do this on a site that has a documented history of problems with water. In addition, they propose to dump shredded construction debris — a practice not allowed in other states including Ohio because it makes it difficult to near impossible for regulators to identify what the original material was before it was shredded.

The materials dumped at the site would include insulation, treated lumber, carpet, metals, plastic, sheetrock, and others. While legal to dump under state and federal laws, these supposedly "inert" materials have been found in other states to leach toxins such as arsenic, benzene, manganese, and lead in levels above health and water standards. For example, a 2009 Ohio EPA study found that 30 of 30 Construction & Demolition Debris (C&DD) landfills tested had at least three parameters that exceeded health or water quality standards. Twenty-nine of the 30 landfills had eight or more parameters that exceeded health or water quality standards. The conclusion was that "Leachate from Ohio C&DD landfills poses a threat to public health and the environment if released to ground water or surface water."

The majority of the material, by-and-large, would come from Anchorage. The same owners of Central Monofill own two separate businesses — Central Environmental Inc., which demolishes buildings, and Central Recycling Services, which operates a recycling facility at an industrial site on Ship Creek in Anchorage where they sort materials from the demolished buildings and recycle

and sell what they can. The leftover material is what they propose to grind up and dump at the Palmer-area site.

The reason Central Monofill wants to dump this material at the Palmer site and a site in Chugiak is because they don't want to pay to dump this trash at the Anchorage landfill. (In fact, they have a lawsuit pending against the city of Anchorage over the landfill rates). And what do you do when you have a bunch of trash you want to dump cheap? Apparently if you're from Anchorage, you come to the Valley!

A close reading of the company's applications to the state and borough show scant protection for the environment, and little accountability from the company if pollution does occur. For example, the proposal does not include a liner to prevent toxic leachate from getting into the water supply. It does not include independent oversight of what is dumped at the facility beyond the company's own employees. Additionally, despite documentation about the uncertain hydrology of this site, their proposal to the state does not include a groundwater monitoring plan. Hydrologists hired by the company reported the site is so arid and receives so little precipitation that they don't need these protections because so little water would get into the dumped material. However, an independent hydrologist hired by the Mat-Su Borough to review the proposal, stated a significant amount of water — up to 1.4 million gallons a year — could filter through the site. Of note, he pointed out the hydrologists hired by CMS used an annual precipitation and evaporation rate, ignoring the fact that precipitation at the site is not evenly spread throughout the year. Contrary to being dry, he noted the US Geological Survey has classified the site as "transitional between maritime and continental climates."

Central Monofill's record so far shows a lack of operational controls and willingness to thumb their nose at local regulators. In 2013, Central Monofill illegally dumped trash on the proposed dump site in violation of borough code and refused to clean it up for months even after being cited for illegal dumping. They forced the Borough to take them to court and even after the court upheld the citations, they refused to clean up. It took the threat of an enforcement order from the Alaska Department of Environmental Conservation to get the material finally removed from the site.

As mentioned, the company's total financial liability if something should go wrong is $5.5 million. That's not much to pay for a company that stands to make millions by not paying to dump at the Anchorage landfill. To add insult to injury, in their application a consultant hired by the company states that should the water get polluted, they could simply hook up the 200-plus surrounding homes to the city of Palmer's water supply. There is no figure attached to how much that would cost and who would pay for it.

According to the company's application, the facility will bring three full-time jobs to the borough, and offer less in property taxes than most pay on their single family homes.

Businesses should be evaluated on their merits, not their potential value to the borough, but it is worth looking at in this case compared to the potential risk to residents.

There are many more serious questions about the suitability of this site, particularly about the hydrology, which includes a history of complaints about water problems dating back to 2005 to both the state Department of Natural Resources and borough. There is also the troubling question of what makes this property, in a prime location for views and commuters, not suitable for residential development as stated by Central Monofill in their original application.

Central Monofill is searching for a way to make its business economical. That's understandable. But the company cannot ask the borough to subsidize its business by forcing residents to shoulder the risks and possible costs of their operation.

Residents have reached out to CMS officials, to let them know about the particular history on this site, the concerns about water quality and to offer assistance for either finding a different site or potentially a way to help with costs of dumping it at the municipal landfill. CMS should take residents up on this offer. If not, the borough should not approve this site without conditions that would protect the public health, safety, and welfare. Those at the least should include a liner, a leachate collection system, independent water monitoring and independent random testing of materials brought to the site.

Monofill proposal puts profits ahead of people

By Sarah Wolcoff | Posted: Thursday, December 11, 2014 7:21 pm

I'd like to help clarify a few things in regard to CMS seeking a monofill permit for a location near homes just south of Palmer. Over and over the few loud voices supporting the permit say of the neighbors that oppose it, "they're just NIMBYs, anti development, too emotional, not fact-based."

It seems they've classified us as snobs and completely dismissed the valid concerns and research of several hundred affected families and industry experts alike. The public needs to know that there is much more going on than the small sound bites they have heard, which mostly originate from CMS employees or people who reside way outside the proposed monofill area.

I have not met any individuals opposing the dump that are anti-development or anti-recycling, or whose main concern is losing their pleasant view, or who are solely concerned about their property values — although they have every reason and right to include those concerns in the long list.

The overriding greatest concern is for the health and lives of our families, followed only second by protection of our livelihoods and property.

The land under the proposed dump was excavated too deeply by the previous gravel company, on the borough's watch. It has never been, and it appears not able to be, successfully repaired. The underlying aquifer was pierced, and it feeds the wells of hundreds of homes and drains into the surrounding lakes and wetlands.

The protective top layer of silt on the land was removed, leaving somewhere between 2 and 10 feet of very porous gravel between the surface of the land and the aquifer, and the water table is a "moving target." Expert hydrology assessments were sought by both the borough and CMS.

CMS hydrologists based their findings on CMS-supplied samples and incorrect and incomplete climate and local plant/water characteristic information. For example, they consider Palmer "semi arid" and assumed steady precipitation rates.

The borough's hydrologist conducted a more thorough and accurate assessment, correctly identifying the climate as "transitional between maritime and continental" and considered specific plant/water information to this area, including the varying precipitation and evaporation rates.

These are not small differences; they are crucial.

Based on faulty information, CMS-hired hydrologists claim that there is low risk for contamination, other than high levels of sulfate and manganese that will yellow teeth and skin and cause a foul odor and taste to our water.

The borough-hired hydrologist, using more thorough and accurate data, has concluded that there is a high risk for water contamination from the variety of toxins that will be dumped and leached through the gravel and from the instability of the land.

And who does the borough base its recommendation upon? The CMS hydrologists only. The borough seems to have ignored the two extensive reports provided by their own hydrologist. When their own hydrologist came to speak before the planning commission at the last hearing, the commission chairman appeared confused and did not recognize the hydrologist's name and even asked him who had hired him and where his reports could be found. The reports were in the chairman's comprehensive information packet and are publicly available as well.

There are numerous other concerns:

•CMS wants to accept regulated asbestos at the dump, with no regular third party oversight, being dependent upon customers to identify and properly contain and haul their debris, and in an area known for its extremely high winds.

•CMS has an established record of disregard for this area and resident health when it was previously caught and fined for illegal dumping on the site.

•CMS has already begun to argue for more lax requirements then those presented by the borough as part of the recommended conditions for approval.

•CMS refuses to acknowledge its dump products as either "toxic" or "hazardous", even though ground construction and demolition debris is known to contain such chemicals as arsenic, lead, formaldehyde, benzene, and more.

The bottom line is that CMS is disregarding our health and well-being and putting their profits above our lives, and this is an extremely poor choice of a location for an unlined monofill. I ask the public to please attend the planning commission meeting at 6 p.m., Dec. 15 in borough chambers to help us give a rallied voice of reason to the borough.

Sarah Wolcoff lives in Palmer.

Monofill presents threats, hazards

Posted: Monday, December 8, 2014 7:43 pm

To the editor:

We are against the Central Monofill (CMS) permit for a private dump at Mile 38.3, Glenn Highway. It presents threats and hazards to the local surrounding area's drinking water, lakes, fish, environment, natural habitat, wild life and air quality. It poses devastating results in the event of an earthquake or fire. It will be an eye sore, reduce property values in the region, and detriment to the National Scenic Byway. The site sits on top of the massive aquifer that feeds our lakes and provides drinking water and connects to the surrounding lakes. The Kepler/Bradley Lakes Recreation, Palmer Hay Flats, and surrounding area will be under threat of irreversible contamination to fragile habitat harming fish, waterfowl, birds of prey and wildlife. This permit would allow tanks and potentially leaky equipment to be parked next to the ponds open to the aquifer. The aquifer is only 2 feet below the surface. Even if they line the dumping cells, they will have to pump them out and who will regulate this procedure to protect any spillage into the ponds or grounds. Where will they dump this toxic fluid? Asbestos, health concerns? Cancer from asbestos is life-threatening. Who will monitor the owners to make sure they dump the asbestos safely? Those who live close by are asked to take a drastic health risk and trust our lives and in the professional credibility of the CMS owners and staff who have already been sited for not complying with contracts and codes. How can they be trusted? It will be cost prohibitive to pay borough staff to monitor their dumping practices, so they will be dumping without adequate accountability and monitoring. Accidents happen and the local residents and habitat will suffer irreversible health issues as a result. The site is in a wind tunnel with winds up to 80 mph and blow trash that has not been covered adequately, along with pollutants causing health hazards. The dumpsite cannot be developed into a subdivision for lakefront homes because the soil in this earthquake zone is too unstable for building. The sand will liquefy in an earthquake like in the 1964 earthquake. How can we risk putting this type of dump there? Planning Commission will vote at public hearing is at 6 p.m., Dec. 15 in the Borough Building — come speak.

Palmer

From bread basket to wastebasket

Posted: Monday, December 8, 2014 7:42 pm

To the editor:

How does it happen in a democracy that a handful of men on the "planning commission," who are appointed to that commission by one man, the mayor of the Mat-Su Borough, can make a decision that impacts the health and safety of hundreds of families and acres of rich, productive farmland in south Palmer?

These seven men have made it known that they are very much in favor of the plan submitted by the applicant, that is, the private monofill dump entity.

No matter that south Palmer already has a polluting monofill dump.

No matter that the proposed site is ever-so-close to residential homes, Kepler-Bradley Lakes recreation area, and directly across the highway from the enormous gravel pit where heavy equipment and trains rattle the ground every day.

No matter that the aquifer that feeds water to hundreds of families and many acres of farmland lies just beneath the proposed dumpsite.

No matter that that those same families and farmers are steadfast in their opposition to this private dump.

These seven guys, and the mayor who appointed them, still want to approve this awful private dump.

It's going to accept asbestos, cut into pieces. It's going to welcome all manner of other building and industrial trash from Anchorage and Southcentral Alaska. It will effectively turn south Palmer into the wastebasket of Alaska.

We can't figure why they want this, or why they would do this to the good people who live here. Will it create jobs? Sure, three of them. Money? Somebody must be in line to get some. I used to like the mayor. Now, not so much.

Palmer

Planning commission postpones landfill decision

Posted: Saturday, December 6, 2014 7:35 pm

PALMER — About 100 people turned out to comment on a proposed landfill before the borough planning commission Dec. 1.

Central Monofill Services Inc. (CMS) has filed a second round of permit applications after failing to obtain a permit in 2013 over concerns about the company's application for a permit to turn a former gravel pit into a monofill — essentially a special kind of landfill for surplus construction debris — along the Parks Highway.

Planning Commission

About 100 people showed up to a Dec. 1 meeting of the Mat-Su Borough Planning Commission to comment on a proposed Palmer landfill. A final decision on the permit could be made as early as Dec. 15.

The landfill item was postponed because spoken testimony ran until 11:30 p.m., and because only four members of the planning commission were present, down from the full compliment of seven members, according to development services manager Alex Strawn.

Borough staff — the final yes-or-no recommendation is usually conducted by planning officer Eileen Probasco — have recommended the site for approval based on the documentation submitted by the company showing the impact to surrounding ground water will be minimal based on the means by which the monofill is constructed.

The company has faced organized opposition from residents in the surrounding area, who say the presence of the material could damage their quality of life, and some who are suspicious about the company's motives after the company appealed six borough citations issued in 2013 through the state court system. Their opposition received a shot in the arm Nov. 25, when the Palmer city council unanimously approved a resolution asking the commission to reject the application.

Company officials say the Palmer location would allow trucks full of materials destined for an Anchorage processing site to return with material for long term storage, and that the site could potentially benefit the community by providing a retail source for secondhand construction materials, as well as jobs.

Opponents generally say the risk to their aquifer, already punctured by previous gravel pit activity at the site, outweighs potential economic benefits to the site.

Some of the latest round of criticism centers around reams of technical data supplied by CMS as part of its second round of applications.

Jim Munter, an Anchorage-based hydrogeologist, submitted a two-page fax pointing out three areas where the company's assessment of the site was potentially flawed. First, consultants for the company listed the site as "semi-arid," a finding that conflicted with previous US Geological Survey findings in the area, which classify the climate as "transitional between maritime and continental climates," according to Munter's written testimony.

"The record still contains significant technical deficiencies that preclude supporting the statement found in the borough findings," Munter wrote.

The classification is important because of the amount of rainfall on the site, Munter wrote. Semi-arid climates experience little rainfall and groundwater reserves aren't recharged, where transitional climates can receive instances of a lot of rainfall, and groundwater reserves are recharged.

USGS figures show 1.4 inches of water annually will recharge the site's ground water, meaning about a million gallons of water will flow through the site annually.

"This is a significant volume of water to percolate through the waste material and enter the groundwater system," Munter wrote.

Models run by Terrasat, the consultant hired to perform the analysis, also underestimate potential groundwater contamination, and a silt cap over the site should be different than the one provided by the consultant. In addition, the consultant assumes compacted and buried waste will be stable, which may not be the case, Munter wrote.

Not all the commentary is so obscure.

Bill Quantick owns a $400,000 house in the Canoe Lake subdivision. He's more worried about potential damage to his pocket book.

"I have an investment here," he said. "My investment is my home, and that's worth $400,000."

In addition, the borough stands to lose money by the presence of another private landfill in the area, which puts competitive pressure on the borough landfill, meaning the borough has to raise scale rates to keep up, Quantick said.

"That's why our costs are going up," he said.

He is also not reassured by a $5-million insurance policy for the site, which won't cover the costs of numerous expensive houses in the area, Quantick said. The policy also won't transfer in the event that the property is sold, Quantick continued. He believes the monofill should go somewhere else.

"They don't have a contingency plan in case something goes wrong," he said. "If they sell it, their liability is gone."

The next meeting of the planning commission will be 6 p.m. Dec. 15.

Palmer Waste Dump Plan Draws Opposition

By Ellen Lockyer, KSKA - Anchorage | December 4, 2014

Like Share One person likes this. Sign Up to see what your friends like.

About one hundred people turned out to speak at a Matanuska Susitna Borough planning commission meeting on Monday. At issue – a plan to construct an inert construction debris dump on private land near Palmer.

Central Monofil Services wants to dump construction debris — some of it containing asbestos– on land near Palmer. The Anchorage based company has applied, twice now, to the Matanuska Susitna Borough for a conditional use permit to use a five acres of a 118 acre gravel pit the company owns as a site for a so called monofil, but the Borough planning commission turned down the company's first request in 2013.

Now, Alex Strawn, development services manager for the Borough, says the planning department is looking at the new application with a "fresh perspective."

"Our official recommendation is approval with forty different protective conditions, and on Monday I urged the planning commission to take our suggestion, but also use caution."

Strawn says he's recommending approval, because Central Monofil has checked off a long laundry list of studies and tests and hired a battery of environmental services to meet the conditions of the monofil application, although Strawn admits he has reservations about the dump's possible effect on the water table.

"So there is some concern that the height of the water table is a moving target. There are other influences that could potentially change the height of the water table. There's a unresolved issue with the industrial ponds just to the North of the pit, that could potentially affect the height of the water table, and there is also a gravel pit operation North of the proposed development that is intending on doing some dredging operation that could also potentially cause the water table to rise."

Strawn says current Borough code is not geared to Central Monofils type of development, and he strongly suggests that a liner be put underneath the dump site. He is also recommending that Central Monofil create a 15 foot buffer between the dump and the water table. 'AK Dept. of Environmental Conservation requires a 10 foot high buffer."

Borough planning commission approval is necessary for the operation to begin. But proceedings at Monday night's planning commission meeting were cramped by the absence of two commissioners. A third commissioner was recused from voting, because of a hint of conflict. Stuart Jacques, representing Central Monofil Services, defended the proposal before the commissioners.

"The design and operations plan for the inert waste monofils are reviewed and permitted by ADEC. This proposed monofil is designed in strict accordance with the ADEC requirements. The only waste allowed to be disposed in this monofil is classified as inert material by ADEC. No municipal, toxic or hazardous waste will be accepted at the facility."

Laurie Aldrich, AK DEC regional program manager for solid waste, said at the meeting that a number of the Borough conditions placed on the monofil are already covered in the state regulations. Aldrich also said that the state permit application is complete, but is pending on the close of a public notice period which ends on December 29.

Most of those who came to offer public comment were against the plan, like farmer Ben VanderWeele and homeowners Rose Williams and Craig Kelly.

"The whole scenario tells me they are sneaky operators. They tried to get away with illegal practices and got caught. I do not want them as my neighbor. The risks to health and quality of life are just too great."

"Would you risk the trust and the health of a community because of one company's financial gain? If our waters become polluted, who will explain that to the mothers and fathers of children who develop illnesses long term."

"These people here, they're coming out of Anchorage and dumping all their crap in our yards. We don't want it.. WE DON'T WANT IT!"

In the end, no vote was taken, and the meeting was continued until December 15.

Alex Strawn says if the planning commission approves the plan, there is a fifteen day period afterward for appeal by any interested party.

Decision delayed on proposed Palmer dump

Zaz Hollander [1]
December 2, 2014

PALMER -- Matanuska-Susitna Borough planning commissioners continued a public hearing Monday on a proposed construction waste dump near Palmer after more than 100 people turned out to testify at a marathon meeting that lasted until nearly midnight.

The commission is deciding whether to approve a conditional-use permit for the Central Monofill Services construction and demolition debris fill [2] proposed for an old gravel pit along the Glenn Highway. The commission last year rejected a similar bid over the threat of blowing litter and risks to the shallow water table in the area. This year, however, borough planners are recommending approval.

Along with the large crowd, the commission on Monday was also short two members, as well as a third who recused himself because he had prior business dealings with the company, a borough planner said. It would have taken all four remaining commissioners voting in favor to approve the permit Monday.

The hearing will resume at the commission's next meeting Dec. 15. It's possible the body could make a decision at that time.

The company says it needs the site to safely dispose of shredded debris from its lucrative Anchorage recycling business because of high municipal landfill rates.

Critics say the fill will only bring three full-time jobs at too great a risk to drinking water from the unlined pit, pointing to contaminated leachate coming off similar sites in other states.

The borough cited Central last year for illegal dumping. The company contested the borough's citation in court but ultimately removed the illegal fill at the order of the Alaska Department of Environmental Conservation.

Opponents of the so-called monofill -- so called because it houses only one type of waste -- outnumbered supporters at Monday's hearing, borough officials say.

The next planning commission [3] meeting is at 6 p.m. on Dec. 15 at the borough building in Palmer.

Who is 'borough staff'?

Posted: Monday, December 1, 2014 7:55 pm

To the editor:

I see that the "borough staff" is recommending approval for the Central Monofill Services dump application. So, does that mean borough employees? Am I the only one who sees this as grossly unethical? Who is the "staff"? Is it the secretaries, receptionists and janitors? Since when do government employees advertise their opinion on whatever the elected group is about to vote for? Or is the borough "staff" voting to approve this abomination for the health, safety and welfare of residents of south Palmer?

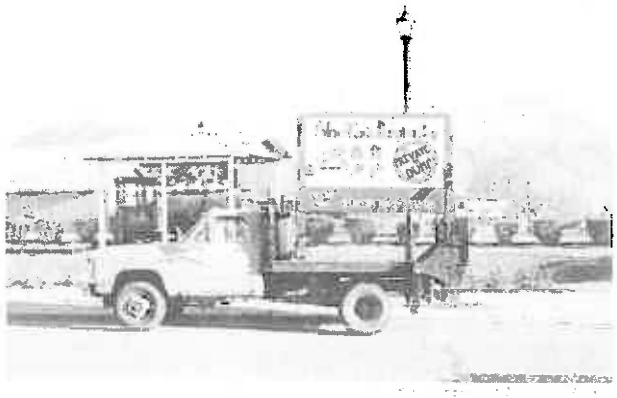
Barbara Landi

Palmer

Public comment ends today

Posted: Friday, October 31, 2014 11:36 am

PALMER — Public comment closes today on a second round of permitting for a monofill site now in its second year.



Public comment ends today

A truck parked in downtown Palmer carries a sign asking people to weigh in on the proposed monofill.

Central Monofill Services Inc. had filed new permit application after originally being denied a permit in late 2013 over concerns its permit application lacked sufficient supporting materials. The company was cited twice in May 2013 for minor offense violations of the trash and junk section of borough code. They resubmitted an application in February 2014 for the recycling site, and the planning commission is set to consider those applications at a public hearing Dec. 1.

In the meantime, the second round of applications has drawn 1,031 pages filed in support of the newest application, and elicited more than 100 comments — some in favor, some opposed — from the public, according to borough planner Susan Lee.

Should the company obtain the permit, company officials say they envision it as a threefold business. First, the area would serve as a stopping ground for material destined for the company's Anchorage recycling facility for processing. It would also serve as the final storage destination for materials processed in Anchorage, meaning trucks would not be returning to the site empty. Finally, it could potentially serve as a resale point for used construction materials for Valley builders, according to Shane Durand, a partner of Central Recycling Services.

"We do a lot of things, a lot of trees and wood and stuff like that," he said. "We've donated items to Boy Scouts who were building things."

The Valley's population has grown considerably, and with that comes construction and demolition debris, which could potentially overflow the Mat-Su Borough community landfill, Durand said.

"On a monthly basis, we probably process and recycle more material than the Valley Recycle Center does in a year," he said.

Opponents of the plan, which include the nearby Gateway Community Council, say the environmental risks — about 6 million gallons of groundwater flow under the site each day,

according to the company's own hydrological analysis of the site, the aquifer has been punctured in the past, and several nearby ponds refill from that water — far outweigh any potential economic benefits.

"We realize there are things that happen in the community, that advancement needs to be made," said community council president Stanley Gillespie. "We just want it to happen in a responsible fashion. I am concerned about the water table and things like that."

The company's attempt to fight citations issued to it in court for past dumping have spoiled the neighborhood's view of the project, said council member Stephanie Nowers. (The company cleaned up past dumping, but only after the Department of Environmental Conservation became involved.) Nowers said she is sympathetic to the economic need for the project, and the company's desire for expansion, but said she's not sold on the location.

"Basically, it's the wrong location for this facility because of the risk it would pose to the water and the air," she said. "There's a history of trouble controlling the water on this property."

The amount of water under and near the property, combined with the company's reticence in addressing past issues, as well as concern about the types of materials present in similar sites in other states, mean the company's new permit application does little to allay neighbors' fears, Nowers said.

"There also needs to be a lot of care taken about what material gets into a dump like this," she said.

Environmental concerns shouldn't factor into the decision, Durand said. The material in the landfill will be screened from view, he said. Potentially hazardous material would have to be removed well before being stored at the site, in accordance with Occupational Health and Safety Administration and federal EPA guidelines. The company also plans to drill monitoring wells, he said.

"This concept that there's this 100-some foot pile of trash, that's completely false," he said.

October 29, 2014

WASILLA -- An Anchorage company is making another run at a building debris recycling and disposal site near Palmer, the same site rejected last year by the Mat-Su Borough planning commission.

Central Environmental Services operates Central Recycling Services [2] and Central Monofill Services, the company behind the proposal to landfill shredded debris including asbestos at a 120-acre former gravel pit at Mile 38 Glenn Highway near the Matanuska Lakes State Recreation Area.

Central Recycling in 2012 made more than $3.5 million selling steel, crushed asphalt, concrete and glass from demolition and construction sites to Seattle and Alaska markets. It also generates roughly 8,000 tons of waste a year and wants a break from Anchorage municipal landfill fees.

Mat-Su planning commissioners in a 4-3 vote last year rejected Central's original monofill proposal, citing concerns about groundwater protection and blowing litter [3] in the windy pit. Residents of nearby subdivisions – a 2010 study showed nearly 50 wells in the area -- waged a noisy opposition campaign.

Also last year, the borough issued six citations charging Central with illegal dumping after the company deposited some shredded material at the site before any permit was approved. The borough Assembly changed the trash code to make sure Central's operations were covered. The illegally dumped material wasn't trucked out until September, after the Alaska Department of Environmental Conservation got involved.

A public comment period for the company's second conditional-use permit application [4] closes Friday. The planning commission will review the application in December.

The company's proposal is essentially the same as the first one, officials say.

Central co-owner Shane Durand said the problem last year wasn't the proposal itself but a lack of "clarity" on five or six points that troubled planning staff. This year's 1,031-page application packet has more hydrological studies and water quality information but basically, Durand said, the proposal is the same.

"Really, the design and the whole function of the facility, the operation, that hasn't changed," he said. "We've just provided more substantiating information and more clarity."

Monofills are less regulated than traditional waste landfills. Federal studies have linked some in Ohio to suspected carcinogens and those in multiple states to hydrogen sulfide gases.They're generally considered by regulators to be one kind of waste -- that's why they're called monofills -- with a low potential to pollute air or water.

But critics of Central's proposed Palmer monofill say it does threaten to pollute area wells and lakes given the unpredictable water table left by gravel operations that punched through the underground aquifer and the potential for contaminants to travel off the property.

Richard Harbuck, a member of the Palmer Toxic Dumping [5] monofill opposition group as well as the local Gateway Community Council, said the concern is that Central will get a permit this time around despite the lack of substantive changes in the application.

"They're basically just doing round two," Harbuck said."Unfortunately, out here in the Valley, they're allowed to reapply for a permit over and over until finally they bust the door down."

The community council last year submitted a letter saying the site was the wrong place for a monofill, and it plans to submit another letter this week, he said.

"We don't feel this is the proper place for this type of activity given the nature of the gravel pit, the hydrology, and the wind problems associated with it, and the basic proximity to an established community," he said.

Opponents also question the company's ability to self-regulate, given Central's compliance record last year. Central, however, says opponents are making too big an issue of the company's brief history in the Mat-Su.

"A lot of people are skewing what happened to the negative, making it seem a lot worse than it really is," Durand said.

The company last week sent out mailers to 5,000 to 6,000 Valley residents in a wide circle around the fill site urging them to "Support Recycling in Alaska" and go to the company website for more information. The flier includes a link to the permit application and the admonition, "Don't let misinformation and stereotypes form your opinion … Get the facts!" above the company's phone number in Anchorage.

Durand said Central's mailer came in response to a flier circulated more locally by Palmer Toxic Dumping warning of poisoned wells, contaminated fish and windblown trash. That flier shows photos of trash and an aerial view of the proposed monofill location amid the numerous lakes of the Kepler-Bradley system. "Can there even be a worse location for a dump?" the brochure reads. "Homes, Wells, Fishing, Scenic Byway & Gateway to Palmer."

The material Central hopes to dispose of at Palmer includes everything from carpet and drywall to asbestos. Some of the asbestos will fall under state regulations that require special precautions like heavy bags, cover to make sure the toxic dust doesn't reach the air and a special cell to hold it.

The company plans to erect portable "catch" fences to snag windblown debris, according to the application. Monofill cells will be contained by soil or tire bales.

In Alaska, the state doesn't require liners to protect groundwater or monitoring wells to check for contamination. Central says it plans to make use of wells but not liners.

The state Department of Environmental Conservation requires the company to demonstrate that the base of the monofill is 10 feet above groundwater, according to an email from Lori Aldrich, DEC's solid-waste program coordinator in Anchorage.

Central says "more than 70 percent" of the actual monofill site meets that requirement and the company will use "onsite earthen materials" to create a buffer for the rest.

DEC has not made a permitting decision on the monofill, Aldrich said.

Along with the Palmer site, Central also hopes to start disposing of recycling waste at a Chugiak property owned by Eklutna Inc. but the discovery of historic contamination at that site has delayed an Anchorage Assembly decision until at least next May.

Central is in the midst of a lawsuit filed in Anchorage Superior Court [6] against the municipality for more than $100,000 in discounted landfill fees the company says it's owed. Central says it's entitled to a 50 percent discount for recycled waste but Anchorage officials say the material in question doesn't qualify for a discounted rate.

Durand said a win in the court case won't change Central's need for a Palmer facility.

"We already went down the course of permitting and designing," he said. "With the municipal landfill, you still don't have any control of how [dump] fees will increase over time."

Borough clears up definition of 'trash'

Posted: Tuesday, April 22, 2014 2:17 pm

PALMER — If you grind, shred or pulverize trash, it is still trash.

That's the latest ruling from the Matanuska-Susitna Borough, which voted Tuesday to make this distinction clear. And if the need for such a rule is not immediately apparent to you, you're not alone.

"We have a definition of trash, and trash is trash based on this definition here," borough assemblyman Ron Arvin. "But when you shred it, pulverize or cause it to be broken, that renders it somehow different. I don't understand why that is."

Why the borough assembly felt compelled to make this change is a long story that relates to a company that wishes to open a monofill — a landfill that only takes in discarded building material — on a plot of land off the Glenn Highway south of Palmer.

When the borough found the operators of that would-be monofill had started moving material to the site without a permit, it cited the company, Central Monofill Services.

When the company appealed, one of its claims was that the stuff it had moved to the site wasn't trash. The material had been shredded into something that could be used as landfill cover. Most landfills cover trash with dirt every day to keep it from blowing around, but company officials have expressed a hope that shredded building material could serve the same purpose.

So, the company argued, it was a product they hoped to sell, not trash. Therefore the ordinances relating to dumping trash and junk do not apply.

A district court agreed with the borough that indeed the stuff was trash, not a product. But the borough's own Board of Adjustments and Appeals ruled that it was not trash, although the company still needed to get a permit.

"That's not a consistent ruling," borough attorney Nick Spriopoulos told the assembly at Tuesday's meeting.

Since the ruling wasn't consistent, he said, the borough needed to fix its codes to make clear what they apply to.

"The question is, do you need a permit to do it?" Spriopoulos said. "Their argument is, 'we don't need a permit, we can do this wherever whenever however we want.'"

Arvin argued that the ordinance seemed aimed directly at one operator, CMS.

Spriopoulos disagreed, saying that the rule was for future operators and meant to apply to anyone who wanted to open an operation similar to what CMS was proposing.

The issue first came to the assembly during its meeting April 1. During that meeting, numerous neighbors of the proposed monofill testified.

"You can't just be dumping ground-up material wherever you want and calling it cover," said Bill Quantick.

Zennon McNeill, president of the Gateway Community Council also favored the change.

"We know what trash is. If you grind it to a finer material it doesn't change the fact that it's still trash," he said.

A 4-3 majority of the assembly eventually sided with the community.

Borough has the power to make the right choice

Posted: Sunday, March 9, 2014 12:00 am

To the editor:

I am writing (Larry DeVilbiss) with great respect and the position you hold as Mayor of the Mat-Su Borough, and I do believe in the same principals as you do.

The Mat-Su Borough needs a strong and sustainable economy, which is obtainable through common-sense leadership. That statement brings up some of the mistakes the borough has made in the past that has caused excess spending, such as the ferry. Planning is a very import part of the economic growth. Building the ferry before a deal to secure dockage put the taxpayers' money at risk and now we are suffering the consequence.

"Open for business" is your statement, and we all understand the only way to grow is to develop. But in developing we need to attract the right kind of business that will employee more than a handful of people. We need public safety and health and business that require industrial locations to be placed in industrial zoned areas.

I would like to bring to your attention to the CMS Monofill that is becoming a major issue for a lot of people. It's not to say we don't want businesses to be developing in the Mat-Su or Palmer, but the right kind of businesses. I am sure you are well aware of the all the problems that are occurring (because of this) and the hardship on the people who choose to live in Palmer.

CMS is not a partner who I would say is on the "win-win" side of things. Just look at the problems it has started. Anchorage Daily News headline March 1 reads, "Recycler sues city over disposal discount for $100,000."

In Palmer court, CMS was found guilty in six citations for illegal dumping. I've been in business and my rule of thumb is strong business ethics, trust and a win-win partnership. No matter what CMS promises and how they think they will take care of problems that arise, the records show it all.

Mr. Mayor I took the liberty to do some research to show you that this is a bad deal all based on how much the borough will lose in taxable income. Taxable income is a vital need to keep the Mat -Su growing, but if you start losing it, where will you find it to make it up? Raising taxes? Not good for someone in your position who wants to lower them.

I went to the online Mat-Su Borough Parcel Viewer to first see how many properties are located with in a one-mile area of CMS property boundaries. From my calculation, there are about 415 private property owners, some with million-dollar homes on them.

In my process, I took five random properties assessments from each subdivision (Canoe Lake, Crimson View and Sky Ranch). I worked out the loss of income that will generate if this dump goes through. Based on the assessment tax for these 15 properties, the loss will be from $270,126 to $675,315. That's not good — not to mention the other loss of income to the borough's own landfill. CMS will be dumping tonnage on its on property to avoid paying its fair share.

You have the power to make the right choice to protect the gateway of Palmer from the smell of leaking decomposing gas (same smell at Highland facility), unsightly trash, contaminating drinking water and to protect the 415 property owners of Palmer whose hard-earned investments are at stake.

None of this would have come to a head if the borough enforced the reclamation clause in the gravel pit agreements.

William Quantick

Palmer

Neighbors have their fill

Posted: Tuesday, March 4, 2014 12:00 pm

PALMER — Having seen a renewed permit application filed earlier this year, neighbors wary of a proposed dump for construction debris say they're still not convinced their concerns have been addressed.

"They're taking advantage of the junkyard/refuse ordinance," said Zennon McNeill, president of the Gateway Community Council, which represents the area containing a decommissioned gravel pit that Central Monofill Services hopes to get permitted to operate as a dump for construction waste.

He said the Mat-Su Borough's regulations would let the company operate a dump with much fewer regulations than its own central landfill.

Central Monofill sees itself as a recycling company, selling whatever building materials it can and crushing up and disposing of the rest. Company officials say they kept 50,000 tons of trash out of landfills last year.

The fight is over what to do with the remainder — mostly ground up wood and Sheetrock, but also asbestos — and CMS says that putting it in a landfill is just not cost effective. Nor is trucking it to some far-off dumpsite. The company says it needs a site close to where buildings are being torn down. In addition to the Palmer site, it is working on permitting one in Chugiak, which neighbors also have opposed.

Neighbors of the Palmer site off the Glenn Highway east of the highway's interchange with the Parks Highway say that the area CMS wants to use is much too sensitive. There's a punctured aquifer there and trash would be too near to the water table. McNeill said he's seen CMS's latest permit and the hydrology report saying it won't seep into groundwater but he doesn't believe it.

Nor is McNeill convinced he said that the monitoring wells CMS has installed will be any help. His neighbors point out that by the time the wells detect anything, the water table would already be polluted.

The site has already landed in court where a district court judge found CMS and one of its owners, Shane Durand, guilty of dumping without a borough permit. At the time, CMS said it wasn't dumping, that it had moved out a building the company intended to reassemble onsite. It was mulching up wood and mixing ground-up debris with dirt to see if that would be a good disposal method.

"We were doing things that we feel are not part of the disposal landfill, but people see us out there doing things and automatically jump to the conclusion that we're dumping stuff," Durand said at the time.

But the Mat-Su Borough said it found illegally dumped trash in multiple test holes drilled on site. Whatever CMS's explanation was in court, it didn't convince Judge John Wolfe, who ordered the site cleaned up. The company has since filed and appeal.

McNeill said his neighbors counted 10 to 15 trucks running material out of there after the cleanup order. He said the that effort took four days, which, given that each truck can hold 20 tons, would mean that thousands of tons of debris was removed.

Durand said on a tour of the site that allegations he'd been dumping were unfounded. He said neighbors had accused him of all sorts of things, including running trucks in the middle of the night.

McNeill and his neighbors provided the Frontiersman with about 300 photos, mostly aerial shots of the site. None of them contain a smoking gun with evidence of tons of debris going into the site, though many do show the wood chipping operation underway and heavy equipment moving what could have been debris, but could just as likely have been dirt. Durand has said he did do some work smoothing out a spot that had been collecting water.

The company has long held that what it intends to dump is not harmful. It has pointed out that people live inside homes built from this stuff.

"These are all the same products in your house you're exposed to," Durand said during that tour earlier this year. "And now once I put them in the ground they're toxic?"

McNeill and his neighbors would ask a different question. What if you ground up a house and put the result in a sifter and poured water through it. Would you drink what came out the bottom?

Borough needs to be clear on monofill flap

Posted: Saturday, March 1, 2014 11:59 pm

We had a sit-down last week with a quartet of neighbors concerned about the idea of filling in a decommissioned gravel pit with construction waste.

Line by line, they went through a story we recently published and responded to the claims Central Monofill Services made about its project. We're digesting the material they gave us now. Look for a story in the coming days.

This issue has consumed a lot of our time over the last year, and it seems to be a quintessentially Mat-Su story. On one hand is a company wanting to do what people have done for years in the Valley — operate an industrial business in a spot that had previously been home to industrial operations. On the other hand is a group of neighbors in what has become a fairly well developed part of the Mat-Su Borough.

Gateway, as the community is called, sits right off the Glenn Highway at its interchange with the Parks Highway. There is a network of lakes back there, some of which include the popular Kepler-Bradley Lakes.

While that now-defunct gravel operation existed for decades, a neighborhood has now grownup nearby. Those homes and land have value, too.

Given its proximity to this lake system and well-established community of neighbors, is a monofill a compatible use of this land?

There was a time when nobody would have blinked an eye. Indeed, there's a very similar facility close by in the neighborhoods near the Alaska State Fairgrounds.

This is far from the only industrial plot where a neighborhood has grown up around it; this situation is a familiar scenario for us in the Mat-Su.

That is why we have been paying so much attention to the Central Monofill story. It's crucial that our borough leaders get this one right.

The Valley has seen its share of these growth-fueled conflicts, and we will continue to see them as our population expands. Perhaps population density is a way to help us map appropriate land uses "growing" forward.

CMS views itself as a recycling company. It diverts construction waste from landfills by selling the steel and concrete and other products. What it wants to dump in Palmer is the stuff it can't sell — ground up Sheetrock and lumber.

We need places to take that kind of material. The Mat-Su Borough Central Landfill takes it. But CMS would like to save on dump fees, which might not be a bad thing if it allows an expansion of recycling construction materials.

But we also understand why neighbors might worry. When operated as a gravel pit, the area had water issues with lakes changing levels and water pouring out of punctured aquifers.

We're not sure what the right call is here. Nor do we envy the Mat-Su Borough Planning Commission and the assembly when it comes to making this decision.

Whatever the outcome, this is an opportunity to develop clear, sustainable policy that can be used the next time industrial uses encroach on now-developed areas.

Because there will be a next time.

RECYCLER SUES CITY OVER DISPOSAL DISCOUNT

By NATHANIEL HERZ
nherz@adn.com

An Anchorage recycling company is suing the city for more than $100,000 over a discount in landfill disposal fees it says it's entitled to but never received.

Central Recycling Services says that Solid Waste Services, the municipal garbage utility, has refused to give a 50 percent discount for the disposal of waste the company had generated as part of its recycling operation, according to a complaint filed in state civil court last month.

City code contains a number of provisions that must be fulfilled before the discount is granted, and Solid Waste Services' position is that the recycling company did not meet them.

"The material they did bring in that qualified, we gave them their discounted rates," said Paul Alcantar, the director of Solid Waste Services. "But this material they were trying to bring us didn't qualify for it."

Alcantar said that the substance in question consisted of ground-up sheetrock and other building materials.

Shane Durand, Central Recycling Services' co-owner, was on vacation and unavailable Thursday, according to a woman who answered the phone at the company's office. She said no one else could speak about the suit.

The company's complaint says it developed a business plan in 2008 after consultations with Solid Waste Services, but that the utility later gave a differing interpretation of the city's recycling code in 2012 that is "contrary to law."

Monofill company re-applies for borough permit

Posted: Saturday, February 15, 2014 11:59 pm

PALMER — A company hoping to dispose of construction debris in a decommissioned gravel pit off the Glenn Highway has resubmitted its application for a Mat-Su Borough permit.

Central Monofill Services was at the center of a series of contentious hearings last year that culminated in a June 2013 ruling from the borough's planning commission denying the company's permit application. CMS has also been cited by the borough for dumping without a permit. The company disputes those citations and has appealed them in court, saying it didn't dump anything. CMS claims it manufactured mulch, brought out recycled building materials to put together an on-site warehouse and experimented with mixing crushed up construction debris with dirt as a means of disposing of it.

The permit denial said the company's plans didn't adequately protect the surrounding neighborhoods from blowing trash — neighbors said trash had already blown onto their properties — nor did it adequately protect groundwater.

Shane Durand with Central Monofill Services said the new application attempts to address those concerns.

For groundwater concerns, he has hired a new hydrologist and commissioned a new report. He said a hydrologist who previously looked at CMS' plans and deemed them incapable of protecting groundwater had viewed the proposal as one to create one massive pile of debris covered in a layer of dirt.

"Everyone was all keyed up that it was this big pile of trash," he said. "The engineer in me doesn't always make it as basic as it needs to be to convey the message."

What the plan actually calls for is a series of small piles stacked next to and on top of one another, each one covered in a layer of dirt. Durand said he took that outside hydrologist's report to heart, but the new consultant has him confident the project will not endanger the water table.

The area has had problems with groundwater in the past. A gravel pit in the area punctured an aquifer, changing water levels in a nearby lake.

On a tour of the pit, he pointed to test wells the company installed to monitor the ground water. He said some concerns about the water — that CMS would dump in manmade ponds on the property — were unfounded from the start. There would be no way he could get a permit to dump in the ponds and he would never want to.

The borough's planning commission, in denying a permit to the monofill, also mentioned those ponds, saying they are attractive to migratory birds and that material the company wants to dispose of could harm those birds if ingested.

Another concern the planning commission dealt with is blowing debris. Durand says in the new application he has outlined a plan to use catch fences around the fill spots. In addition, he said, the plan describes the use of anemometers.

"At certain wind speeds we won't dump any materials," he said.

Yet another concern neighbors had was that the monofill would contain hazardous materials. Durand said his company employs people to find those materials. There is no incentive to hide them, Durand said, because a contractor that brings them in has to pay to clean them up and is required to also pay CMS a fee.

But, he said, the new plan also includes a dump spot where contractors will put their loads down. That spot will move across the site as the pit is filled, but it will always have a liner separating the material and the ground.

He said he has included in the application letters from neighbors at the company's current facility along Anchorage's Ship Creek and another facility in Salcha.

"We don't have any issues with this stuff blowing around," he said about those operations. "The neighbors here aren't going to notice it's going on."

He said a lot of people have asked why the company chose this pit. Durand said it's hard to find a location that works this well. He said the former gravel pit needs to be back filled to be reclaimed as parkland or a subdivision. Now, aside from a handful of homes on the other side of a treed buffer zone, the majority of his neighbors are other gravel pits.

"Try to find a site that's at least 20 acres, doesn't have a stream running through it, doesn't have residences all around it," Durand said.

Also, a monofill site that both take construction debris from Anchorage and the Valley doesn't yet exist. A site farther out would make the prospect not cost-effective. In addition to the jobs CMS is offering, the company diverts tons of waste from the local landfill. He said his operation in Anchorage diverted 50,000 tons of waste from landfills there last year. For comparison, Durand said Valley Center for Recycling Solutions informed him it diverted 1,500 tons in that same period.

"It's a huge number that we're trying to do," he said.

MEMORANDUM

DATE: December 22, 2014

TO: Matanuska-Susitna Borough Planning Commission

FROM: Alex Strawn, Development Services Manager

SUBJECT: Resolution 15-01 - Proposed findings and conclusions to support denial of Planning Commission Resolution 14-33

Based on testimony at the December 1st and 15th public hearing, recent evidence submitted to the record, Planning Commission comments, and the record as a whole, staff believes the commission's decision to deny the conditional use permit for a construction and demolition monofill is supportable. In order to assist the commission with producing a resolution to support denial of PC Resolution 14-33, staff has prepared a draft resolution for consideration by the commission.

MATANUSKA-SUSITNA BOROUGH
PLANNING COMMISSION RESOLUTION NO. 15-01

A RESOLUTION OF THE MATANUSKA-SUSITNA BOROUGH PLANNING COMMISSION ADOPTING FINDINGS OF FACT AND CONCLUSIONS OF LAW TO SUPPORT THEIR FAILURE TO APPROVE PLANNING COMMISSION RESOLUTION 14-33.

WHEREAS, Planning Commission Resolution 14-33 recommended approval of a conditional use permit, subject to conditions, for the operation of an inert material monofill on parcels 17N02E18C010 and 17N02E19B006, within Township 17 North, Range 2 East, Sections 18 and 19, Seward Meridian; and

WHEREAS, on December 1st and 15th, 2014, the Planning Commission held a public hearing on Resolution 14-33; and

WHEREAS, the Planning Commission's vote on the motion failed to garner a majority vote on December 15, 2014 which constitutes denial of the conditional use permit; and

WHEREAS, comments received regarding the proposed monofill raised the following concerns:

- Material has been dumped without MSB or ADEC permits
- Hazardous waste could end up in the landfill
- Trash was dumped in the water
- Water pollution
- Health problems
- Pollution of surrounding lakes
- Protection of watershed and aquifer

- Windblown unhealthy dust and particulates from the monofill, including asbestos
- Contamination of water wells
- Windblown materials/debris onto surrounding properties
- Previous problems with gravel extraction on this property and rising water table
- Breach of berm between two of the manmade lakes and impact on surrounding water levels
- Lack of oversight and planning
- Applicant's disregard for regulations
- Lack of CMS's ability to manage and provide oversight of the facility
- Failure to reclaim the property
- Contamination of soil
- Lowering of property values
- Visual impacts to the Glenn Highway, a Scenic Byway
- Threat to migratory and breeding birds
- How the redesign of the Glenn Highway will affect this site
- Rising water levels of nearby lakes
- Improper handling and disposal of asbestos
- Depositing of lead based paint, mercury and heavy metals in the monofill
- Close proximity to residential area
- Contamination of fish in Canoe, Kepler-Bradley Lake system
- Inconsistent with comprehensive plans
- Highway safety and access issues; and

WHEREAS, the proposed monofill is inconsistent with the goals and policies of the Borough-Wide Comprehensive Plan (2005 Update) and the Core Area Comprehensive Plan (2007 Update) because the monofill is an industrial use that is incompatible with the neighboring residential areas; and

WHEREAS, Goal LU-1 of the Borough-Wide Comprehensive Plan (2005 Update) is to *Protect and enhance the public safety, health, and welfare of Borough residents*; and

WHEREAS, Policy LU1-1 Borough-Wide Comprehensive Plan (2005 Update)is to *Provide for consistent, compatible, effective, and efficient development within the Borough*; and

WHEREAS, Goal LU-2 of the Borough-Wide Comprehensive Plan (2005 Update) is to *Protect residential neighborhoods and associated property values*; and

WHEREAS, Policy LU2-1 of the Borough-Wide Comprehensive Plan (2005 Update) is to *Develop and implement regulations that protect residential development by separating incompatible uses, while encouraging uses that support such residential uses including office, commercial and other mixed-use developments that are shown to have positive cumulative impacts to the neighborhood*; and

WHEREAS, Goal LU-3 of the Borough-Wide Comprehensive Plan (2005 Update) is to *Encourage commercial and industrial development that is compatible with residential development and local community desires*; and

WHEREAS, Policy LU3-1 of the Borough-Wide Comprehensive Plan (2005 Update) is to *Develop and implement regulations that provide for non-residential development; and*

WHEREAS, Goal LU-5 of the Borough-Wide Comprehensive Plan (2005 Update) is to *Protect and enhance the Borough's natural resources including watersheds, groundwater supplies and air quality; and*

WHEREAS, Policy LU4-1 of the Borough-Wide Comprehensive Plan (2005 Update) is to *Identify, monitor, protect, and enhance the quantity and quality of the Borough's watersheds, groundwater aquifers, and clean air resources; and*

WHEREAS, Goal CQ-1 of the Borough-Wide Comprehensive Plan (2005 Update) is to *Protect natural systems and features from the potentially negative impacts of human activities, but not limited to, land development;* and

WHEREAS, Policy CQ1-2 of the Borough-Wide Comprehensive Plan (2005 Update) is to *Manage activities affecting air, vegetation, water, and the land to maintain or improve environmental quality, to preserve fish and wildlife habitat, to prevent degradation or loss of natural features and functions, and to minimize risks to life and property; and*

WHEREAS, this site is located within the boundary of the Core Area Comprehensive Plan (2007 Update) boundary; and

WHEREAS, Policy 1-B of the Land Use Goal within the Core Area Comprehensive Plan (2007 Update) is to *Promote an orderly land use pattern suited to the demand for attractive settings in*

which to live, work, shop, learn, play, and carry on other daily activities; and

WHEREAS, Policy Discussion related to policy 1-B within the Core Area Comprehensive Plan (2007 Update) states *As the Core Area's population grows – it is forecast to double by 2025 and absorb most of the remaining vacant land in the Core Area – the limited vacant land supply must provide a balanced supply of well-located sites for homes, businesses, private and public institutions, industry, parks and recreation, public improvements, and other purposes. The plan needs to provide a place for every permitted land use, but not all land uses go well side-by-side. Some uses such as residences and open space or retail trade and service business are usually compatible and enhance each other. Others, like heavy industrial activities and residential subdivisions, make poor neighbors and are best separated by distance or buffers;* and

WHEREAS, Goal 7 of the Core Area Comprehensive Plan (2007 Update) is to *Protect and conserve the natural resources that support the well-being of residents and the region's tourism and recreation economy;* and

WHEREAS, Policy 7-A of the Core Area Comprehensive Plan (2007 Update) is to *Protect groundwater supplies and quality;* and

WHEREAS, Policy Discussion related to policy 7-A of the Core Area Comprehensive Plan (2007 Update) states *Many existing and future residences and businesses will depend on on-site groundwater resources for their water supply. Protection of the supply and quality of groundwater is vital to sustain this arrangement*; and

WHEREAS, Policy 7-B of the Core Area Comprehensive Plan (2007 Update) is to *Protect surface water quality*; and

WHEREAS, Policy Discussion related to policy 7-B of the Core Area Comprehensive Plan (2007 Update) states *The Core Area's many lakes are valuable natural and economic assets. They provide an attractive setting for residential development, enhance property values, support a variety of public and private recreational activities, and provide natural habitat, absorb runoff. These lakes are linked to streams and wetlands with similar positive values. The borough's existing program of lake management plans already provides some protection for surface water quality*; and

WHEREAS, the Alaska Department of Environmental Conservation has not approved a permit for this development, as proposed; and

WHEREAS, the previous use of this site was for earth materials extraction. There are pre-existing legal nonconforming

use rights for earth materials extraction for this property, which means that the industrial use was not approved under the current regulatory structure or evaluated for compatibility with surrounding land uses; and

WHEREAS, The proposed monofill is an industrial use and is an incompatible use with the surrounding residential areas as there is the possibility of contamination of drinking water wells and surrounding lakes within the area; and

WHEREAS, the underlying water table level is subject to significant fluctuations resulting from adjacent land use activities including the spill way located on the property and the dredging operation immediately to the north; and

WHEREAS, the Middle Pond on the site is unable to reach its predevelopment equilibrium when surface water is diverted out of the Middle Pond, as is currently occurring through the spillway; as testified by Charlie Cobb, State Dam Safety Engineer for the Water Resources Section of the Department of Natural Resources; and

WHEREAS, water levels in the three gravel pit ponds on site tend to sit at three different elevations and are acutely related to surface connections, but also related to groundwater levels in the vicinity or vice versa; as testified by Charlie Cobb, Dam Safety Engineer; and

WHEREAS, the embankments between the three surface ponds of the gravel pits, and possibly the surrounding shoreline, may not be dynamically stable due to the liquefaction potential of silt and sand soils in the vicinity; as testified by Charlie Cobb, Dam Safety Engineer; and

WHEREAS, as conveyed by the Department of Natural Resources Water Resources Section, the continued diversion of surface water and the integrity of the dam at the site are unresolved; and

WHEREAS, the applicant has not addressed how they will monitor or manage the seasonal high water table fluctuations to ensure that the bottom of the monofill is not annually saturated by groundwater; and

WHEREAS, a hydrologic report submitted to the Borough early in 2014 predicts a potential 2-foot water table rise resulting from dredging operations adjacent to the proposed monofill site to the north; and

WHEREAS, contaminants from the monofill will likely travel to surrounding drinking water wells and lakes; and

WHEREAS, a hydrology report within the record conveys that there is a high risk of water table contamination due to leachate; and

WHEREAS, the CMS hydrologists (Maddox & Associates) used annual precipitation and evaporation rates, which ignores the fact that precipitation at the site is not evenly spread throughout the year; and

WHEREAS, JA Munter Consulting Inc. cited a recent USGS study which characterizes the site as transitional between maritime and continental climates and the USGS estimates that 1.4 inches of water per year will recharge groundwater at this site, which equates to more than one million gallons of water, which is a significant volume of water to percolate through the waste material and enter the groundwater system; and

WHEREAS, as proposed, the monofill will be unlined with no system to capture, treat, or monitor polluting leachate which is likely to leave the site; and

WHEREAS, soils in the area of the monofill site are very porous loose gravels and glacial loess, and offer little or no filtering capacity for fluids being emitted or drained from the fill. Without a liner, a ten foot separation is not sufficient to prevent leachate from reaching the water table, thus increasing the risk of contamination of the water resources in the area; and

WHEREAS, the monofill is designed to have water flow through the construction debris with an average hydro

conductivity of approximately 2.0 x 10-2 cm/second, as determined by an engineering report submitted by the applicant; and

WHEREAS, contaminants typically found in groundwater surrounding construction and demolition landfills include cadmium, lead, iron, manganese, several chlorinated volatile organic compounds, sulfate, hydrogen sulfide, and TDS (Total Dissolved Solids). In addition, chromium and arsenic are found if chrominated copper arsenate-treated wood is disposed in the landfill; and

WHEREAS, there is the potential for the construction and demolition monofill to undergo spontaneous combustion or to catch fire by other outside sources. In the event that the material catches fire, a common method for fire suppression is application of copious amounts of water and foam, which could leach into the water table and cause dramatic and sudden increase of polluting leachate; and

WHEREAS, the applicant did not propose a water quality monitoring program as part of the application; and

WHEREAS, the applicant has not provided a plan for remediation should the water table be polluted beyond safe drinking water levels; and

WHEREAS, as proposed, it is not possible to set conditions

to adequately protect the groundwater and aquifer from anticipated negative effects of the monofill; and

WHEREAS, the commission cannot find that this conditional use permit will preserve or not detract from the value, character, and integrity of the surrounding area as required by 17.60.100(B)(1) based on the above findings of fact and conclusions of law; and

WHEREAS, based on the above findings of fact, the commission concludes that it cannot find that this conditional use permit will not be harmful to the public health, safety, convenience, and welfare as required by 17.60.100(B)(2).

NOW, THEREFORE, BE IT RESOLVED, that the Matanuska-Susitna Borough Planning Commission hereby adopts the aforementioned findings of fact and conclusions of law supporting denial of Planning Commission Resolution 14-33.

BE IT FUTHER RESOLVED that this is a final determination which may be appealed in accordance with MSB 15.39.140 by filing a written notice of appeal with the Borough Clerk within 21 days from the date this determination was issued. If an appeal is not filed as described in the preceding sentence, the right to appeal is forfeited.

Brian Endle Proposed DRAFT Findings of Fact
Supporting Denial of Resolution 14-33
Central Monofill Services, Inc.

Amendment E1

WHEREAS, Resolution 13-22 recommended approval of a conditional use permit for the operation of an inert material monofill on parcels 17N02E18C010 and 17N02E19B006, within Township 17 North, Range 2 East, Sections 18 and 19, Seward Meridian; and

Amendment E2

WHEREAS, Resolution 13-30 contains findings of fact and conclusions of law which support denial of the conditional use permit; and

Amendment E3

WHEREAS, on June 3, 2013, the Planning Commission held a public hearing on Resolution 13-22; and

Amendment E4

WHEREAS, the Planning Commission's vote on the motion failed to garner a majority vote on June 3, 2013; and

Amendment E5

NOW, THEREFORE, BE IT RESOLVED, that the Matanuska-Susitna Borough Planning Commission denied the conditional use permit based on the following findings of fact and conclusions of law:

1. Borough staff has documented trash and the Daily Cover (screened fines) that has blown from the monofill onto adjacent properties.
2. Borough staff has documented trash and/or the Daily Cover blown over the 40 foot hill on the west side of the property.
3. ADEC regulations (18 AAC 60.420(2)) states a monofill must be operated so that litter is controlled by fencing or another approved means, and is removed from access roadways and other areas in the facility.
4. This region experiences frequent multiple-day high-wind events each year since it is at the confluence of the Matanuska and Knik River valleys. Loose debris and dust from the fill has and is expected to continue to scatter beyond the boundaries of the site.

5. Fencing is not expected to contain the trash and/or the Daily Cover/screened fines on the site. The trash and/or Daily Cover/screened fines will get blown into the trees and surrounding properties.
6. CMS has not provided adequate mitigation plans for preventing trash and debris from leaving the site.
7. The Daily Cover/screened fines consist of shredded materials that are less than two inches in size. Material this size is easily distributed by the wind.
8. The inert debris that will be deposited on the site will be shredded into pieces 12 inches or smaller. Material this size can also become windblown.
9. The previous use of this site was for earth materials extraction. There are pre-existing legal nonconforming use rights for earth materials extraction for this property, which means that the industrial use was not approved under the current regulatory structure or evaluated for compatibility with surrounding land uses.
10. The proposed monofill is an industrial use and is an incompatible use with the surrounding residential areas as it cannot be completely screened from the surrounding residences to the west, debris from the monofill will blow onto the surrounding residences and roadways, and there is the possibility of contamination of drinking water wells in the area.
11. The final height of the monofill is proposed to be at 150 feet above sea level (ASL). The proposed monofill will have 2700 feet of frontage along the Glenn Highway. The proposed completed height of the monofill will be 35 to 40 feet above the adjacent berms on the southwest perimeter of the site.
12. The monofill will be unsightly from the Glenn Highway, and from the surrounding properties, including the residential subdivision directly to the west. It is not possible to completely screen the monofill because of topography and because the project is proposed to be 150 feet (ASL) high at completion.
13. The proposed monofill is inconsistent with some of the land use goals and policies of the Borough-Wide Comprehensive Plan (2005 Update) and the monofill is an industrial use and incompatible with the neighboring residential areas.
14. The proposed monofill is inconsistent with some of the goals and policies of the Borough-Wide Comprehensive Plan (2005 Update) and the Core Area Comprehensive Plan (2007) as there is the potential for groundwater

contamination that could have negative effects on drinking waste and surface water quality.

15. The proposed monofill is inconsistent with the goals and policies of the Borough-Wide Comprehensive Plan (2005 Update) and the Core Area Comprehensive Plan (2007 Update)
16. The proposed monofill will not preserve and will detract from the value, character, and integrity of the surrounding area as the monofill will be unsightly from the Glenn Highway and from the surrounding properties including the residential subdivision directly to the west. It is not possible to completely screen the monofill because of topography and because the project is proposed to be 150 feet (ASL) high at completion. Conditions may be set to address trash and debris containment on the site (17.60.100(B)(1)).
17. Comments received regarding the proposed monofill raised the following concerns:
    - Dumping of material without MSB or ADEC permits.
    - Dumping of hazardous waste
    - Trash in the water
    - Water pollution
    - Health problems
    - Pollution of surrounding lakes
    - Protection of watershed and aquifer
    - Compromising the aquifer
    - Windblown unhealthy dust and particulates from the monofill
    - Pollution of drinking water
    - Windblown materials/debris onto surrounding properties
    - Impact on downstream waterways
    - Long term safety of water quality
    - Contamination of water table
    - Use the existing landfill for disposal of material
    - Previous problems with gravel extraction on this property and rising water table
    - Trash in the trees is an eyesore
    - Breaching of berm between two of the manmade lakes and impact on surrounding water levels
    - Long term impact of contamination of drinking water
    - Disregard for lakes, streams, and drinking water

- Lack of oversight and planning
- Lack of CMS's ability to manage and provide oversight of the facility
- Concerns about reclamation of the property
- Dumping of garbage/monofill near standing water
- High wind area will cover surrounding area with dust and debris from monofill
- Contamination of soil
- Residents are entitled to clean air, land and water
- Lowering of property values
- The Glenn Highway is a Scenic Byway
- Threat to migratory and breeding birds
- How the redesign of the Glenn Highway will affect this site
- Rising water level of Canoe Lake due to dam breach
- Concerns about asbestos being dumped at this site
- Concerns about lead based paint, mercury and heavy metals deposited in the monofill
- Too close to residential area

18. The monofill will be unlined.
19. Materials brought to the site will not be deposited on an impermeable surface that will contain any prohibited and/or contaminated materials.
20. No system is proposed to capture, treat, or monitor leachate leaving the site.
21. Alaska Department of Environmental Conservation ADEC regulations state that an unlined landfill may not be located closer than 10 feet above the highest measured level of an aquifer of resource value unless the landfill is constructed two feet or more above the natural ground surface (18 AAC 60.217).
22. The applicant has not addressed how they will monitor or manage the seasonal high water table fluctuations to ensure that the bottom of the monofill is not annually saturated by groundwater.
23. Soils in the area of the monofill site are very porous, loose gravels and glacial loess, and offer little or no filtering capacity for fluids being emitted or drained from the fill. Without a liner, a ten foot separation is not sufficient to prevent leachate from reaching the water table increasing the risk of potential contamination of the water resources in the area.

24. Contaminants typically found in groundwater surrounding construction and demolition landfills include cadmium, lead, iron, manganese, several chlorinated volatile organic compounds, sulfate, hydrogen sulfide, and TDS (Total Dissolved Solids). Chromium and arsenic are found if chrominated copper arsenate-treated wood is disposed in the landfill.
25. The site appears to be up gradient of the groundwater flow direction from private drinking water wells. Without a Fate and Transport Model for compounds of concern to evaluate the risk posed by the proposed monofill to down gradient wells, there is no way to evaluate if these compounds will reach the drinking water wells at concentrations posing risk to health.
26. Baseline data for water quality has not been provided.
27. Seasonal water table elevation fluctuations have not been established.
28. The top of the completed monofill drops 40 feet from one end to the other. The run-off from this slope could pose problems with the dredge ponds at the base of the monofill causing problems with the aquifer.
29. Migratory birds, especially waterfowl, are attracted to the ponds already on the site. Material used as daily cover includes material potentially hazardous to birds if ingested.
30. This site is less than one mile from the Palmer Hay Flats Refuge, which is the major migratory bird refuge in Southcentral Alaska.
31. It is not possible to set conditions to adequately protect the groundwater and aquifer from anticipated negative effects of the monofill. The stormwater management proposed by the applicant will maximize the volume of water infiltrating the monofill. This infiltrating meltwater and rainfall will percolate through the placed materials, enter the groundwater and a large unconfined aquifer. The leachate from the construction and debris monofill may contain compounds at concentrations above drinking water standards. That water will impact private and public water wells used by homes, neighborhoods and farms, and could also enter nearby lakes that are heavily used. Adequate baseline water quality data monitoring to establish the quality of the existing water, the level of the groundwater throughout the monofill site, and the porosity of the materials under the monofill, has not been provided.
32. The proposed monofill will be harmful to the public

health, safety, convenience, and welfare (17.60.100(B)(2)).

33. The site plan depicts the proposed structures in compliance with setback requirements.
34. The application minimally addresses the impacts of the climate, geology, hydrology and geography of the site and the impacts to surrounding land uses.
35. According to documentation and studies the proposed monofill site is located where the topography, geology, hydrology and soil are inadequate for protection of ground and surface water quality.
36. The conditional use does not fulfill all other requirements of this chapter (17.60.100(B)(4)).
37. The berm adjacent to the Glenn Highway will have to extend in height in order to obscure the view of the monofill from the highway.

Amendment E6

WHEREAS, Resolutions 14-33 recommended approval of a conditional use permit for the operation by Central Monofill Services (CMS) of an inert material monofill on parcels 17N02E18C010 and 17N02E19B006, within Township 17 North, Range 2 East, Sections 18 and 19, Seward Meridian; and

Amendment E7

WHEREAS, Resolution 14-XX contains findings of fact and conclusions of law which support denial of the conditional use permit; and

Amendment E8

WHEREAS, on December 1, 2014 and December 15, 2014, the Planning Commission held public hearings on Resolution 14-33; and

Amendment E9

WHEREAS the Planning Commission's vote on the motion failed to garner a majority vote on December 15, 2014.

Amendment E10

BE IT FUTHER RESOLVED that this is a final determination which may be appealed in accordance with MSB 15.39.140 by filing a written notice of appeal with the Borough Clerk within 21 days from the date this determination was issued. If an appeal is not filed as described in the preceding sentence, the right to appeal is forfeited.

Tomas Adams Proposed DRAFT Findings of Fact and Conclusions Supporting Denial of Resolution 14-33 Central Monofill Services, Inc.

Findings of Fact

Amendment A1
Applicant proposes operation of a monofill for the disposal of inert waste material and asbestos-containing materials.

Amendment A2
Past use of the property has included extraction of earth materials.

Amendment A3
Gravel extraction activities in the area have created concerns about potential effects on nearby drinking water wells serving individual residences and public water systems and potential hydrologic effects on other resources.

Amendment A4
Soils beneath the site are highly permeable.

Amendment A5
In the vicinity of the proposed monofill, groundwater occurs in an unconfined aquifer tapped by numerous domestic and community water supply wells.

Amendment A6
The inert waste monofill design does not include an engineered native-soil or other liner.

Amendment A7
No system is proposed to capture, treat, or dispose leachate from the inert waste monofill.

Amendment A8
Documentation regarding potential for groundwater contamination is conflicting.

Amendment A9
Applicant has not obtained a permit from the Alaska Department of Environmental Conservation (ADEC) for an inert waste monofill.

Amendment A10
This region experiences frequent multiple-day high-wind events each year since it is at the confluence of the Matanuska and Knik River valleys. Loose debris and dust from the fill has and is expected to continue to scatter beyond the boundaries of the site.

Amendment A11
Fencing is not expected to contain the trash and/or the daily cover/screened fines on the site. The trash and/or the daily cover/screened fines will get blown into the trees and surrounding properties.

Amendment A12
The inert debris that will be deposited on the site will be shredded into pieces 12 inches or smaller. Material this size can also become windblown.

Conclusions

Amendment A13
Based upon the above findings, the Planning Commission makes the following conclusions:

1. The conditional use will detract from the value, character, and integrity of the surrounding area; and
2. the proposed inert waste monofill may be harmful to the public health, safety, convenience and welfare.

Vern Rauchenstein Proposed DRAFT Findings of Fact
Supporting Denial of Resolution 14-33
Central Monofill Services, Inc.

Amendment R1

WHEREAS, the MSB needs a more centrally and a more suitable location for a monofill that can accept RACM and Non-RACM materials. (Between 2002 and 2012 close to 2400 homes were built each year in the MSB); and

Amendment R2

WHEREAS, Title-Transfer between extraction companies is understandable; but title-transfer to a Monofill Company puts the whole C.U.P. in question; and

Amendment R3

WHEREAS, fighting a fire or underground fire in a monofill presents difficulties:

1. How is aquifer protected?
2. Compositions of materials changes.

Amendment R4

WHEREAS, the applicant assumed the masterplan of the C.U.P. when they purchased the property. With RACM and Non-RACM in the monofill, the difficulties that this presents were not addressed; and

This Page

Left Blank

Thomas Healy Proposed DRAFT Findings of Fact
Supporting Denial of Resolution 14-33
Central Monofill Services, Inc.

Amendment H1

WHEREAS, except for a limited number of land uses, Mat-Su Borough code does not have zoning regulations or districts regulating the location of specific land uses. Without comprehensive zoning regulations, the Planning Commission must analyze land use and permit applications against the standards established by Borough comprehensive plans to determine if the proposed use complies with these plans; and

Amendment H2

WHEREAS, the Borough Comprehensive Plan contains Goal LU-1, which states, "Protect and enhance the public safety, health and welfare of Borough residents," and Policy LU-1-1, which states, "Provide for consistent, compatible, effective and efficient development within the Borough;" and

Amendment H3

WHEREAS, substantial evidence provided in written and spoken testimony expressed concern that the proposed monofill will negatively impact ground water quality, property values and the general welfare of the area, and the monofill will not be compatible with adjacent residential properties; and

Amendment H4

WHEREAS, the Borough Comprehensive Plan contains Goal LU-2, which states, "Protect residential neighborhoods and associated property values," and Policy LU2-1, which states, "Develop and implement regulations that protect residential development by separating incompatible uses, while encouraging uses that support such residential uses including office, commercial and other mixed-use developments that are shown to have positive cumulative impacts to the neighborhood;" and

Amendment H5

WHEREAS, the proposed monofill does not protect residential neighborhoods and associated property values, as shown by evidence provided that leachate from the proposed use has the potential to contaminate the aquifer that is the source of drinking water for adjacent residential uses and evidence that debris processed by the applicant from the proposed monofill site has been blown onto adjacent residential properties; and

Amendment H6

WHEREAS, the proximity of the monofill to established residential areas does not provide adequate separation between incompatible uses and granting the permit for this industrial use may discourage the types of development in this area listed in Policy LU2-1 that are compatible with and support residential uses; and

Amendment H7

WHEREAS, substantial evidence in the record indicates there are serious questions whether the proposed use is compatible with surrounding uses and that it will have "positive cumulative impacts to the neighborhood," including photographs documenting debris and litter blown from this site onto adjacent properties; hydrologic concerns raised by J.A. Munter Consulting, Inc. regarding possible contamination of the aquifer by leachate from the monofill; and extensive testimony by residents and property owners in the area identifying what they believe will be negative effects of the proposed use; and

Amendment H8

WHEREAS, the Borough Comprehensive Plan contains Goal LU-3, which states, "Encourage commercial and industrial development that is compatible with residential development and local community desires;" and

Amendment H9

WHEREAS, the proposed monofill is a long-term industrial use that will occupy property used previously for earth materials extraction. This property has pre-existing legal nonconforming use rights for earth materials extraction. According to the Borough staff report, this means "the industrial use was in existence prior to the current regulatory structure and was not evaluated for compatibility with surrounding land uses." The proposed industrial use must be evaluated for compatibility with surrounding land uses under the current regulatory structure; and

Amendment H10

WHEREAS, the record contains extensive written and spoken testimony from the community opposing this conditional use permit which outweighs testimony in favor by wide margins: more than four to one in spoken testimony and more than two to one in written testimony. The record also contains testimony opposing the permit by the Gateway Community Council, homeowner associations, the City of Palmer, and dozens of residents and property owners of the area; and

Amendment H11

WHEREAS, the overwhelming testimony in opposition to the proposed monofill indicates strongly that the proposed activity is not "compatible with residential development and local community desires;" and

Amendment H12

WHEREAS, the Borough Comprehensive Plan contains Goal LU-4, which states, "Protect and enhance the Borough's natural resources including watersheds, groundwater supplies and air quality," and Policy LU4-1, which states, "Identify, monitor, protect and enhance the quantity and quality of the Borough's watersheds, groundwater aquifers and clean air resources;" and

Amendment H13

WHEREAS, the record contains extensive information on the aquifer beneath the proposed monofill site and surrounding area. This aquifer is the source of drinking water for several wells serving residential uses adjacent to and in the area of the proposed monofill site; and

Amendment H14

WHEREAS, hydrologists hired by the applicant in their reports challenged conclusions by hydrologist J.A. Munter Consulting regarding the production of leachate and the hydrologic dynamics between the monofill and the aquifer. Munter responded by letter of December 1, 2014, stating, "Although a few sections of my prior reviews would benefit from some minor revisions, I have found no compelling technical case to substantially revise or retract any of my prior comments. The record still contains significant technical deficiencies that preclude supporting the statement found in the Borough findings, that this facility does not have the potential for groundwater contamination that could have negative effects on drinking water;" and

Amendment H15

WHEREAS, this fundamental disagreement in the conclusions of professional hydrologists regarding the proposed monofill provides no clear assurance that the monofill will "protect and enhance the Borough's natural resources including watersheds, groundwater supplies and air quality," leading to a likelihood that the monofill could contaminate the groundwater that is the source of drinking water for dozens of residences in the area; and

Amendment H16

WHEREAS, the proposed monofill project is not consistent with the Borough Comprehensive Plan; and

Amendment H17

WHEREAS, the Borough Core Area Comprehensive Plan (2007 Update) contains Policy 1-B, which states, "Promote an orderly land use pattern suited to the demand for attractive settings in which to live, work, shop, learn, play and carry on other daily activities," and, in the Policy Discussion, states, "The plan needs to provide a place for every permitted land use, but not all land uses go well side-by-side. Some uses such as residences and open space or retail trade and service business are usually compatible and enhance each other. Others, like heavy industrial activities and residential subdivisions, make poor neighbors and are best separated by distance or buffers;" and

Amendment H18

WHEREAS, the proposed monofill is not compatible with this policy as testimony showed it abuts residential areas and has the potential to adversely affect those uses and values; and

Amendment H19

WHEREAS, the previous use on this property had pre-existing legal nonconforming use rights for earth materials extraction, an industrial use. However, according to the Borough staff report, "the industrial use was not approved under the current regulatory structure or evaluated for compatibility with surrounding land uses." Evaluating the proposed industrial monofill use under current land use plans and policies indicates, from testimony provided to the Commission, that the monofill use is not compatible with surrounding land uses, specifically residential areas; and

Amendment H20

WHEREAS, the Borough Core Area Comprehensive Plan contains Policy 1-J, which states, "Encourage light industrial parks," and, in the Policy Discussion, states, "Restored earth materials extraction sites with good highway access can be prime candidates for light industrial uses;" and

Amendment H21

WHEREAS, the proposed industrial monofill use is not consistent with this policy; and

Amendment H22

WHEREAS, the Borough Core Area Comprehensive Plan contains Policy 1-M, which states, "Collaborate with operators of large earth materials extraction sites to plan for site reclamation and re-use after earth materials extraction activities are finished," and, in the Policy Discussion, states, "Redevelopment of these sites makes good use of the borough's land base and enhances the value and economic potential of nearby properties;" and

Amendment H23

WHEREAS, extensive testimony in this matter expressed concern over negative impacts on residential uses and groundwater and air quality in this area; and

Amendment H24

WHEREAS, development of the property as a monofill industrial site will not "enhance the value and economic potential of nearby properties," and is not consistent with Policy 1-M; and

Amendment H25

WHEREAS, the Borough Core Area Comprehensive Plan contains Policy 7-A, which states, "Protect groundwater supplies and quality," and the Policy Discussion states, in part, ""Many existing and future residences and businesses will depend on on-site groundwater resources for their water supply. Protection of the supply and quality of groundwater is vital to sustain this arrangement;" and

Amendment H26

WHEREAS, the record shows there is significant disagreement between hydrological reports of groundwater resources on this property and the potential of the proposed monofill to produce leachate that may enter the groundwater; and

Amendment H27

WHEREAS, this difference of professional opinions indicates there is not adequate assurance that the proposed monofill will protect groundwater supplies and quality; and

Amendment H28

WHEREAS, the Borough Core Area Comprehensive Plan contains Policy 7-B, which states, "Protect surface water quality," and, in the Policy Discussion, states, "The Core Area's many lakes are valuable natural and economic assets. These lakes are linked to streams and wetlands with similar positive values;" and

Amendment H29

WHEREAS, extensive testimony and hydrologic reports in the record confirm a direct link between gravel dredge ponds on the applicant's property and the natural lakes in the nearby Crevasse-Morraine State Park lake system. Testimony expressed concern over the effects of previous gravel mining activities and possible effects of the proposed monofill on the aquifer and lake surface water in this area; and

Amendment H30

WHEREAS, evidence supports a finding that the proposed construction and operation of an industrial monofill at the proposed location is inconsistent with the Borough Comprehensive Plan and the Borough Core Area Comprehensive Plan; and

Amendment H31

WHEREAS, evidence supports a finding that the proposed project has the potential to impose significant negative impacts on properties and natural resources in the area; and

Amendment H32

WHEREAS, the extent of the potential negative impacts associated with this proposed use, including contamination of the aquifer, excessive windblown debris, lack of adequate visual screening, the potential for fire, as well as possible negative impacts on property values and future investment in the area supports a finding that it is not possible to attach conditions to the permit that would adequately mitigate or prevent these risks; and

To: Mary Brodigan
Subject: CMS Findings/Conclusions

RECEIVED
DEC 16 2014
Matanuska - Susitna Borough
Planning Dept Administration

Mary,

I would like to submit for the commission the 37 findings of fact and conclusions of law contained in Resolution 13-30(AM) on page 2173 of the December 1, 2014 packet as findings of fact and conclusions of law to support the denial of Resolution 14-33:

I would like to include the WHEREAS clauses contained in Resolution 13-30(AM).

I would also like to add the following WHEREAS clauses.

1. A whereas stated as follows:
WHEREAS, Resolutions 14-33 recommended approval of a conditional use permit for the operation by Central Monofill Services (CMS) of an inert material monofill on parcels 17N02E18C010 and 17N02E19B006, within Township 17 North, Range 2 East, Sections 18 and 19, Seward Meridian; and 2. a whereas stated as follows:
WHEREAS Resolution 14-XX contains findings of fact and conclusions of law which support denial of the conditional use permit; and 3. a whereas stated as follows:
WHEREAS on December 1, 2014 and December 15, 2014, the Planning Commission held public hearings on Resolution 14-33; and 4. a whereas stated as follows:
WHEREAS the Planning Commission's vote on the motion failed to garner a majority vote on December 15, 2014; and

I would like to move this at the January 5th meeting.

Thanks,

Brian Endle

MATANUSKA-SUSITNA BOROUGH
PLANNING COMMISSION RESOLUTION NO. 13-30 (Am)

A RESOLUTION OF THE MATANUSKA-SUSITNA BOROUGH PLANNING COMMISSION ADOPTING FINDINGS OF FACT AND CONCLUSIONS TO SUPPORT THEIR FAILURE TO APPROVE RESOLUTION 13-22.

WHEREAS, Resolution 13-22 recommended approval of a conditional use permit for the operation by Central Monofill Services (CMS) of an inert material monofill on parcels 17N02E18C010 and 17N02E19B006, within Township 17 North, Range 2 East, Sections 18 and 19, Seward Meridian; and

WHEREAS, Resolution 13-30 contains findings of fact and conclusions of law which support denial of the conditional use permit; and

WHEREAS, on June 3, 2013, the Planning Commission held a public hearing on Resolution 13-22; and

WHEREAS, the Planning Commission's vote on the motion failed to garner a majority vote on June 3, 2013; and

NOW, THEREFORE, BE IT RESOLVED, that the Matanuska-Susitna Borough Planning Commission denied the conditional use permit based on the following findings of fact and conclusions of law:

1. Borough staff has documented trash and the Daily Cover (screened fines) that have blown from the monofill onto adjacent properties.

2. Borough staff has documented trash and/or the Daily Cover blown over the 40 foot hill on the west side of the property.

3. ADEC regulations (18 AAC 60.420(2)) states a monofill must be operated so that litter is controlled by fencing or another approved means, and is removed from access roadways and other areas in the facility.

4. This region experiences frequent multiple-day high-wind events each year since it is at the confluence of the Matanuska and Knik River valleys. Loose debris and dust from the fill has and is expected to continue to scatter beyond the boundaries of the site.

5. Fencing is not expected to contain the trash and/or the Daily Cover/screened fines on the site. The trash and/or Daily Cover/screened fines will get blown into the trees and surrounding properties.

6. CMS has not provided adequate mitigation plans for preventing trash and debris from leaving the site.

7. The Daily Cover/screened fines consist of shredded materials that are less than two inches in size. Material this size is easily distributed by the wind.

8. The inert debris that will be deposited on the site will be shredded into pieces 12 inches or smaller. Material this size can also become windblown.

9. The previous use of this site was for earth materials extraction. There are pre-existing legal nonconforming use rights for earth materials extraction for this property, which means that the industrial use was not approved under the current regulatory structure or evaluated for compatibility with surrounding land uses.

10. The proposed monofill is an industrial use and is an incompatible use with the surrounding residential areas as it cannot be completely screened from the surrounding residences to the west, debris from the monofill will blow onto the surrounding residences and roadways, and there is the possibility of contamination of drinking water wells in the area.

11. The final height of the monofill is proposed to be at 150 feet above sea level (ASL). The proposed monofill will have 2700 feet of frontage along the Glenn Highway. The proposed completed height of the monofill will be 35 to 40 feet above the adjacent berms on the southwest perimeter of the site.

12. The monofill will be unsightly from the Glenn Highway, and from the surrounding properties, including the residential subdivision directly to the west. It is not possible to completely screen the monofill because of topography and because the project is proposed to be 150 feet (ASL) high at completion.

13. The proposed monofill is inconsistent with some of the land use goals and policies of the Borough-Wide Comprehensive Plan (2005 Update) and the monofill is an industrial use and incompatible with the neighboring residential areas.

14. The proposed monofill is inconsistent with some of the goals and policies of the Borough-Wide Comprehensive Plan (2005 Update) and the Core Area Comprehensive Plan (2007) as there is the potential for groundwater contamination that could have negative effects on drinking water and surface water quality.

15. The proposed monofill is inconsistent with the goals and policies of the Borough-Wide Comprehensive Plan (2005 Update) and the Core Area Comprehensive Plan (2007 Update)

16. The proposed monofill will not preserve and will detract from the value, character, and integrity of the surrounding area as the monofill will be unsightly from the Glenn Highway and from the surrounding properties including the residential subdivision directly to the west. It is not possible to completely screen the monofill because of topography and because the project is proposed to be 150 feet (ASL) high at completion. Conditions may be set to address trash and debris containment on the site (17.60.100(B)(1)).

17. Comments received regarding the proposed monofill raised the following concerns:
    - Dumping of material without MSB or ADEC permits.

- Dumping of hazardous waste
- Trash in the water
- Water pollution
- Health problems
- Pollution of surrounding lakes
- Protection of watershed and aquifer
- Compromising the aquifer
- Windblown unhealthy dust and particulates from the monofill
- Pollution of drinking water
- Windblown materials/debris onto surrounding properties
- Impact on downstream waterways
- Long term safety of water quality
- Contamination of water table
- Use the existing landfill for disposal of material
- Previous problems with gravel extraction on this property and rising water table
- Trash in the trees is an eyesore
- Breaching of berm between two of the manmade lakes and impact on surrounding water levels
- Long term impact of contamination of drinking water
- Disregard for lakes, streams, and drinking water
- Lack of oversight and planning
- Lack of CMS's ability to manage and provide oversight of the facility
- Concerns about reclamation of the property
- Dumping of garbage/monofill near standing water
- High wind area will cover surrounding area with dust and debris from monofill
- Contamination of soil
- Residents are entitled to clean air, land and water
- Lowering of property values
- The Glenn Highway is a Scenic Byway
- Threat to migratory and breeding birds
- How the redesign of the Glenn Highway will affect this site

- Rising water level of Canoe Lake due to dam breach
- Concerns about asbestos being dumped at this site
- Concerns about lead based paint, mercury and heavy metals deposited in the monofill
- Too close to residential area

18. The monofill will be unlined.

19. Materials brought to the site will not be deposited on an impermeable surface that will contain any prohibited and/or contaminated materials.

20. No system is proposed to capture, treat, or monitor leachate leaving the site.

21. Alaska Department of Environmental Conservation (ADEC) regulations state that an unlined landfill may not be located closer than 10 feet above the highest measured level of an aquifer of resource value unless the landfill is constructed two feet or more above the natural ground surface (18 AAC 60.217).

22. The applicant has not addressed how they will monitor or manage the seasonal high water table fluctuations to ensure that the bottom of the monofill is not annually saturated by groundwater.

23. Soils in the area of the monofill site are very porous, loose gravels and glacial loess, and offer little or no filtering capacity for fluids being emitted or drained from the fill. Without a liner, a ten foot separation is not sufficient to prevent leachate from reaching the water table increasing the risk of potential contamination of the water resources in the area.

24. Contaminants typically found in groundwater surrounding construction and demolition landfills include cadmium, lead, iron, manganese, several chlorinated volatile organic compounds, sulfate, hydrogen sulfide, and TDS (Total Dissolved Solids). Chromium and arsenic are found if chrominated copper arsenate-treated wood is disposed in the landfill.

25. The site appears to be up gradient of the groundwater flow direction from private drinking water wells. Without a Fate and Transport Model for compounds of concern to evaluate the risk posed by the proposed monofill to down gradient wells, there is no way to evaluate if these compounds will reach the drinking water wells at concentrations posing risk to health.

26. Baseline data for water quality has not been provided.

27. Seasonal water table elevation fluctuations have not been established.

28. The top of the completed monofill drops 40 feet from one end to the other. The run-off from this slope could pose problems with the dredge ponds at the base of the monofill causing problems with the aquifer.

29. Migratory birds, especially waterfowl, are attracted to the ponds already on the site. Material used as daily cover includes material potentially hazardous to birds if ingested.

30. This site is less than one mile from the Palmer Hay Flats Refuge, which is the major migratory bird refuge in Southcentral Alaska.

31. It is not possible to set conditions to adequately protect the groundwater and aquifer from anticipated negative effects of the monofill. The stormwater management proposed by the applicant will maximize the volume of water infiltrating the monofill. This infiltrating meltwater and rainfall will percolate through the placed materials, enter the groundwater and a large unconfined aquifer. The leachate from the construction and debris monofill may contain compounds at concentrations above drinking water standards. That water will impact private and public water wells used by homes, neighborhoods and farms, and could also enter nearby lakes that are heavily used. Adequate baseline water quality data monitoring to establish the quality of the existing water, the level of the groundwater throughout the monofill site, and the porosity of the materials under the monofill, has not been provided.

32. The proposed monofill will be harmful to the public health, safety, convenience, and welfare (17.60.100(B)(2)).

33. The site plan depicts the proposed structures in compliance with setback requirements.

34. The application minimally addresses the impacts of the climate, geology, hydrology and geography of the site and the impacts to surrounding land uses.

35. According to documentation and studies the proposed monofill site is located where the topography, geology, hydrology and soil are inadequate for protection of ground and surface water quality.

36. The conditional use does not fulfill all other requirements of this chapter (17.60.100(B)(4)).

37. The berm adjacent to the Glenn Highway will have to extend in height in order to obscure the view of the monofill from the highway.

Mary,

Attached are a list of findings that formed the basis of my decision not to support Resolution 14-33.

I'll be out of the office Friday (12/19), but returning Monday.

Tom Adams, P.E.
Vice-President

Lounsbury & Associates, Inc.

Planning Commission
Resolution 14-33
December 18, 2014

Findings of Fact

1. Applicant proposes operation of a monofill for the disposal of inert waste material and asbestos-containing materials.
2. Past use of the property has included extraction of earth materials.
3. Gravel extraction activities in the area have created concerns about potential effects on nearby drinking water wells serving individual residences and public water systems and potential hydrologic effects on other resources.
4. Soils beneath the site are highly permeable.
5. In the vicinity of the proposed monofill, groundwater occurs in an unconfined aquifer tapped by numerous domestic and community water supply wells.
6. The inert waste monofill design does not include an engineered native-soil or other liner.
7. No system is proposed to capture, treat, or dispose leachate from the inert waste monofill.
8. Documentation regarding potential for groundwater contamination is conflicting.
9. Applicant has not obtained a permit from the Alaska Department of Environmental Conservation (ADEC) for an inert waste monofill.
10. This region experiences frequent multiple-day high-wind events each year since it is at the confluence of the Matanuska and Knik River valleys. Loose debris and dust from the fill has and is expected to continue to scatter beyond the boundaries of the site.
11. Fencing is not expected to contain the trash and/or the daily cover/screened fines on the site. The trash and/or daily cover/screened fines will get blown into the trees and surrounding properties.
12. The inert debris that will be deposited on the site will be shredded into pieces 12 inches or smaller. Material this size can also become windblown.

Conclusions

Based upon the above findings, the Planning Commission makes the following conclusions:

1) The conditional use will detract from the value, character, and integrity of the surrounding area; and
2) the proposed inert waste monofill may be harmful to the public health, safety, convenience and welfare.

Tom Adams
Commissioner, District 6

To: Mary Brodigan
Subject: Resolution 14-33

RECEIVED
DEC 19 2014
Matanuska - Susitna Borough
Planning Dept Administration

Disapproval by the MSB Planning Commission of Resolution 14-33 on Dec. 15, 2014.

Reasons for disapproval:

1. The MSB needs a more centrally and a more suitable location for a monofill that can accept RACM and Non-RACM materials. (Between 2002 and 2012 close to 2400 homes were built each year in the MSB)
2. Title-Transfer between extraction companies is understandable; but Title-Transfer to a Monofill Company puts the whole C.U.P. in question.
3. Fighting a fire or underground fire in a monofill presents difficulties.
   a) How is aquafier protected?
   b) Compositions of materials changes.
4. The applicant assumed the masterplan of the C.U.P. when they purchased the property. With RACM and Non-RACM in the monofill, the difficulties that this presents were not addressed.

DRAFT Findings of Fact Regarding Central Monofill Services, Inc. Application for a Conditional User Permit To Operate a Monofill at 2560 South Glenn Highway

By Thomas Healy, Planning Commissioner
December 22, 2014

WHEREAS, except for a limited number of land uses, Mat-Su Borough code does not have zoning regulations or districts regulating the location of specific land uses. Without comprehensive zoning regulations, the Planning Commission must analyze land use and permit applications against the standards established by Borough comprehensive plans to determine if the proposed use complies with these plans, and

WHEREAS, the Borough Comprehensive Plan contains Goal LU-1, which states, "Protect and enhance the public safety, health and welfare of Borough residents," and Policy LU-1-1, which states, "Provide for consistent, compatible, effective and efficient development within the Borough," and

WHEREAS, substantial evidence provided in written and spoken testimony expressed concern that the proposed monofill will negatively impact ground water quality, property values and the general welfare of the area, and the monofill will not be compatible with adjacent residential properties, and

WHEREAS, the Borough Comprehensive Plan contains Goal LU-2, which states, "Protect residential neighborhoods and associated property values," and Policy LU2-1, which states, "Develop and implement regulations that protect residential development by separating incompatible uses, while encouraging uses that support such residential uses including office, commercial and other mixed-use developments that are shown to have positive cumulative impacts to the neighborhood," and

WHEREAS, the proposed monofill does not protect residential neighborhoods and associated property values, as shown by evidence provided that leachate from the proposed use has the potential to contaminate the aquifer that is the source of drinking water for adjacent residential uses and evidence that debris processed by the applicant from the proposed monofill site has been blown onto adjacent residential properties, and

WHEREAS, the proximity of the monofill to established residential areas does not provide adequate separation between incompatible uses and granting the permit for this industrial use may discourage the types of development in this area listed in Policy LU2-1 that are compatible with and support residential uses, and

WHEREAS, substantial evidence in the record indicates there are serious questions whether the proposed use is compatible with surrounding uses and that it will have "positive cumulative impacts to the neighborhood," including photographs documenting debris and litter blown from this site onto adjacent properties; hydrologic concerns raised by J.A. Munter Consulting, Inc. regarding possible contamination of the aquifer by leachate from the monofill; and extensive testimony by residents and property owners in the area identifying what they believe will be negative effects of the proposed use, and

WHEREAS, the Borough Comprehensive Plan contains Goal LU-3, which states, "Encourage commercial and industrial development that is compatible with residential development and local community desires," and

WHEREAS, the proposed monofill is a long-term industrial use that will occupy property used previously for earth materials extraction. This property has pre-existing legal nonconforming use rights for earth materials extraction. According to the Borough staff report, this means "the industrial use was in existence prior to the current regulatory structure and was not evaluated for compatibility with surrounding land uses." The proposed industrial use must be evaluated for compatibility with surrounding land uses under the current regulatory structure, and

WHEREAS, the record contains extensive written and spoken testimony from the community opposing this conditional use permit which outweighs testimony in favor by wide margins: more than four to one in spoken testimony and more than two to one in written testimony. The record also contains testimony opposing the permit by the Gateway Community Council, homeowner associations, the City of Palmer, and dozens of residents and property owners of the area, and

WHEREAS, the overwhelming testimony in opposition to the proposed monofill indicates strongly that the proposed activity is not "compatible with residential development and local community desires," and

WHEREAS, the Borough Comprehensive Plan contains Goal LU-4, which states, "Protect and enhance the Borough's natural resources including watersheds, groundwater supplies and air quality," and Policy LU4-1, which states, "Identify, monitor, protect and enhance the quantity and quality of the Borough's watersheds, groundwater aquifers and clean air resources," and

WHEREAS, the record contains extensive information on the aquifer beneath the proposed monofill site and surrounding area. This aquifer is the source of drinking water for several wells serving residential uses adjacent to and in the area of the proposed monofill site, and

WHEREAS, hydrologists hired by the applicant in their reports challenged conclusions by hydrologist J.A. Munter Consulting regarding the production of

leachate and the hydrologic dynamics between the monofill and the aquifer. Munter responded by letter of December 1, 2014, stating, "Although a few sections of my prior reviews would benefit from some minor revisions, I have found no compelling technical case to substantially revise or retract any of my prior comments. The record still contains significant technical deficiencies that preclude supporting the statement found in the Borough findings, that this facility does not have the potential for groundwater contamination that could have negative effects on drinking water," and

WHEREAS, this fundamental disagreement in the conclusions of professional hydrologists regarding the proposed monofill provides no clear assurance that the monofill will "protect and enhance the Borough's natural resources including watersheds, groundwater supplies and air quality," leading to a likelihood that the monofill could contaminate the groundwater that is the source of drinking water for dozens of residences in the area, and

WHEREAS, the proposed monofill project is not consistent with the Borough Comprehensive Plan, and

WHEREAS, the Borough Core Area Comprehensive Plan (2007 Update) contains Policy 1-B, which states, "Promote an orderly land use pattern suited to the demand for attractive settings in which to live, work, shop, learn, play and carry on other daily activities," and, in the Policy Discussion, states, "The plan needs to provide a place for every permitted land use, but not all land uses go well side-by-side. Some uses such as residences and open space or retail trade and service business are usually compatible and enhance each other. Others, like heavy industrial activities and residential subdivisions, make poor neighbors and are best separated by distance or buffers," and

WHEREAS, the proposed monofill is not compatible with this policy as testimony showed it abuts residential areas and has the potential to adversely affect those uses and values, and

WHEREAS, the previous use on this property had pre-existing legal nonconforming use rights for earth materials extraction, an industrial use. However, according to the Borough staff report, "the industrial use was not approved under the current regulatory structure or evaluated for compatibility with surrounding land uses." Evaluating the proposed industrial monofill use under current land use plans and policies indicates, from testimony provided to the Commission, that the monofill use is not compatible with surrounding land uses, specifically residential areas, and

WHEREAS, the Borough Core Area Comprehensive Plan contains Policy 1-J, which states, "Encourage light industrial parks," and, in the Policy Discussion, states, "Restored earth materials extraction sites with good highway access can be prime candidates for light industrial uses," and

WHEREAS, the proposed industrial monofill use is not consistent with this policy, and

WHEREAS, the Borough Core Area Comprehensive Plan contains Policy 1-M, which states, "Collaborate with operators of large earth materials extraction sites to plan for site reclamation and re-use after earth materials extraction activities are finished," and, in the Policy Discussion, states, "Redevelopment of these sites makes good use of the borough's land base and enhances the value and economic potential of nearby properties," and

WHEREAS, extensive testimony in this matter expressed concern over negative impacts on residential uses and groundwater and air quality in this area, and

WHEREAS, development of the property as a monofill industrial site will not "enhance the value and economic potential of nearby properties," and is not consistent with Policy 1-M, and

WHEREAS, the Borough Core Area Comprehensive Plan contains Policy 7-A, which states, "Protect groundwater supplies and quality," and the Policy Discussion states, in part, ""Many existing and future residences and businesses will depend on on-site groundwater resources for their water supply. Protection of the supply and quality of groundwater is vital to sustain this arrangement," and

WHEREAS, the record shows there is significant disagreement between hydrological reports of groundwater resources on this property and the potential of the proposed monofill to produce leachate that may enter the groundwater, and

WHEREAS, this difference of professional opinions indicates there is not adequate assurance that the proposed monofill will protect groundwater supplies and quality, and

WHEREAS, the Borough Core Area Comprehensive Plan contains Policy 7-B, which states, "Protect surface water quality," and, in the Policy Discussion, states, "The Core Area's many lakes are valuable natural and economic assets. ...These lakes are linked to streams and wetlands with similar positive values," and

WHEREAS, extensive testimony and hydrologic reports in the record confirm a direct link between gravel dredge ponds on the applicant's property and the natural lakes in the nearby Crevasse-Morraine State Park lake system. Testimony expressed concern over the effects of previous gravel mining activities and possible effects of the proposed monofill on the aquifer and lake surface water in this area, and

WHEREAS, evidence supports a finding that the proposed construction and operation of an industrial monofill at the proposed location is inconsistent with the Borough Comprehensive Plan and the Borough Core Area Comprehensive Plan, and

WHEREAS, evidence supports a finding that the proposed project has the potential to impose significant negative impacts on properties and natural resources in the area, and

WHEREAS, the extent of the potential negative impacts associated with this proposed use, including contamination of the aquifer, excessive windblown debris, lack of adequate visual screening, the potential for fire, as well as possible negative impacts on property values and future investment in the area supports a finding that it is not possible to attach conditions to the permit that would adequately mitigate or prevent these risks.

PC Resolution 14-33

CMS Monofill

By: Susan Lee
Introduced: November 3, 2014
Public Hearing: December 1, 2014
Action: Failed

MATANUSKA-SUSITNA BOROUGH
PLANNING COMMISSION RESOLUTION NO. 14-33

A RESOLUTION OF THE MATANUSKA-SUSITNA BOROUGH PLANNING COMMISSION APPROVING A CONDITIONAL USE PERMIT UNDER MSB CODE 17.60 FOR THE OPERATION OF A MONOFILL FOR THE DISPOSAL OF INERT CONSTRUCTION AND DEMOLITION DEBRIS, INCLUDING REGULATED ASBESTOS-CONTAINING MATERIAL (RACM) AND NON-REGULATED ASBESTOS-CONTAINING MATERIAL (NON-RACM) AND AN OUTDOOR STORAGE YARD FOR THE SALE OF SALVAGEABLE/RECYCLABLE MATERIALS, LOCATED AT 2840 S. GLENN HIGHWAY (TAX ID: 17N02E18C010) AND 2560 S. GLENN HIGHWAY (TAX ID: 17N02E19B006); WITHIN TOWNSHIP 17 NORTH, RANGE 2 EAST, SECTIONS 18 AND 19, SEWARD MERIDIAN

WHEREAS, an application for a conditional use permit under MSB 17.60 has been received for the operation of a monofill for the disposal of inert construction and demolition debris and an outdoor storage yard for the sale of salvageable/recyclable materials at 2840 S. Glenn Highway (Tax ID: 17N02E18C010) and 2560 S. Glenn Highway (Tax ID: 17N02E19B006); and

WHEREAS, the planning commission reviewed this application, associated materials, and the staff report, with respect to standards set forth in MSB 17.60.100 and 1760.110; and

WHEREAS, findings of fact and conclusions of law have been listed in the staff report dated December 1, 2014; and

WHEREAS, the planning commission conducted a public hearing on December 1, 2014 on this matter; and

WHEREAS, in 2013 Borough staff documented trash and daily cover (screened fines) that had blown from the monofill site onto adjacent properties; and

WHEREAS, ADEC regulations (18 AAC 60.420(2)) state a monofill must be operated so that litter is controlled by fencing or other approved means, and is removed from access roadways and other areas in the facility; and

WHEREAS, this region experiences frequent multiple-day high-wind events each year since it is at the confluence of the Matanuska and Knik River valleys. Loose debris and dust from the fill has, and is, expected to continue to scatter beyond the boundaries of the site; and

WHEREAS, the 15' tall cell berms will be constructed prior to waste placement; and

WEHREAS, as the cells increase in height the sides will be built up with tire bales that will be covered with topsoil and seeded for revegetation; and

WHEREAS, the use of a large sheep's foot landfill compactor to place and immediately compact the waste in the cell is the next method to prevent loose and blowing debris; and

WHEREAS, regularly covering the waste with soil further prevents blowing debris; and

WHEREAS, the daily cover/screened fines consist of shredded materials that are less than three inches in size. Material this size is easily distributed by the wind; and

WHEREAS, the inert debris that will be deposited on the site will be shredded into pieces 12 inches or smaller. Material this size can also become windblown; and

WHEREAS, after the residual material is deposited and compacted it will be covered with the daily cover/screened fines, which will also be compacted. The monofill material will be covered with soil weekly; and

WHEREAS, the applicant has stated that a remote weather station will be placed on the site to monitor wind and when sustained wind conditions on the site exceed 20 mph, waste will not be unloaded without secondary containment in place; and

WHEREAS, secondary containment proposed by the applicant involves the use of portable catch fences up to 15' tall and of variable lengths. The catch fences are used to slow the wind down and catch blown debris downwind; and

WHEREAS, normal size opening on the catch fences is 2" x 2"; and

WHEREAS, the openings on the catch fences are still large enough that smaller pieces of material could still blow through them; and

WHEREAS, the previous use of this site was for earth materials extraction. There are pre-existing legal nonconforming use rights for earth materials extraction for this property, which means that the industrial use was not approved under the current regulatory structure or evaluated for compatibility with surrounding land uses; and

WHEREAS, the surrounding land uses include earth material extraction sites to the north and on the south side of the Glenn Highway; residential subdivisions to the west and northeast; and agricultural uses to the east of the site; and

WHEREAS, the site is required to be visually screened on a year round basis from the view of any traveled or public right-of-way. The site must be screened from the Glenn Highway and from the section line easement on the west side of the property and the east-west section line running through the middle of the property. Staff is recommending the site also be screened from the residential properties on the west side; and

WHEREAS, the proposed monofill is an industrial use. The monofill can be screened with existing berms and by building up the berms and constructing site obscuring fencing. Screening from the western properties will have to be developed as the site is built up; and

WHEREAS, salvageable/recyclable materials that are stored outside must also be screened from the Glenn Highway and section line easements on the property; and

WHEREAS, the maximum finished elevation of the monofill will be 162 feet Above Sea Level. The adjacent Glenn Highway has an average finished elevation of 117 feet Above Sea Level, so the maximum height will be a little more than 40 feet above the Glenn Highway. The existing tree covered berm along the highway has an average elevation of 130 feet Above Sea Level. The finished revegetated height of the monofill will be above the berm on the south side, adjacent to the Glenn Highway. The maximum depth of the monofill will be 75 feet with an average depth of 50 feet; and

WHEREAS, should the site be modified as a result of the Glenn Highway Reconstruction Project, an updated site plan and plan of operations will need to be submitted to the Borough; and

WHEREAS, conditions can be set to prevent material from blowing off-site; and

WHEREAS, documentation has been provided demonstrating that the monofill operation does not have the potential for groundwater contamination that could have negative effects on drinking water and surface water quality; and

WHEREAS, the monofill can be developed with proper engineering and operational controls to protect the natural resources and public health and safety; and

WHEREAS, with conditions, the proposed conditional use is consistent tithe goals and policies of the Borough-Wide Comprehensive Plan (2005 Update) and the Core Area Comprehensive Plan (2007 Update); and

WHEREAS, the proposed monofill will preserve and will not detract from the value, character and integrity of the surrounding area as the monofill will be screened from the Glenn Highway, section line easements, and residential properties. Conditions will be set to address trash and debris containment on the site. Documentation has been provided showing that the proposed monofill will not contaminate the groundwater or have negative effects on drinking water or surface water quality; and

WHEREAS, comments received regarding the proposed monofill raised the following concerns: dumping of material without MSB or ADEC permits; dumping of hazardous waste; trash in the water; waster pollution; health problems; pollution of surrounding lakes; protection of watershed and aquifer; compromising the aquifer; windblown unhealthy dust and particulates from the monofill; contamination of water wells; windblown materials/debris onto surrounding properties; previous problems with gravel extraction on this property and rising water table;

breaching of berm between two of the manmade lakes and impact on surrounding water levels; lack of oversight and planning; applicants disregard for regulations; lack of CMS's ability to manage and provide oversight of the facility; concerns about reclamation of the property; contamination of soil; lowering of property values; the Glenn Highway is a Scenic Byway; threat to migratory and breeding birds; how the redesign of the Glenn Highway will affect this site; rising water levels of nearby lakes; improper handling and disposal of asbestos; concerns about lead based paint, mercury and heavy metals deposited in the monofill; too close to residential area; contamination of fish in Canoe, Kepler-Bradley Lake system; inconsistent with comprehensive plans, and highway safety and access issues; and

WHEREAS, there have been many concerns and comments regarding the potential for groundwater contamination that could have negative effects on drinking water and surface water quality. The applicant has provided documentation from four consultants that this will not be the case: Groundwater data has been collected. Based on the groundwater data the monofill will be designed to be at least 10 feet above groundwater. Water level data is continually being collected. The water table generally fluctuates less than one foot. The water that supplies the unconfined aquifer that underlies the proposed monofill is primarily through infiltration from the Matanuska

River. The bottom of the monofill cells will be established based on all of the water data that is collected up to the time of construction of that cell. On-site groundwater monitoring wells were installed. Three wells lie under the footprint of the proposed monofill, which can be utilized to indicate the depth of water beneath the refuse. Historical groundwater levels will be used to determine the historical high groundwater levels beneath the proposed monofill site. If there is any leachate at all, the monofill is designed to minimize the moisture levels in the material, so that the rate of decay and rot will not significantly impact any leachate that leaves the monofill. The monofill is designed so that waste will not stay in a saturated condition. CMS submitted a groundwater monitoring plan with their application. Subsequently CMS withdrew the plan after their consultant EMI found that the probability of creating a leachate that would impact the groundwater is so low. The proposed monofill is located in a semi-arid climate where the balance between the annual precipitation and the annual evaporation precludes the formation of any significant volume of leachate. The average annual precipitation rate in the area of the proposed monofill is approximately 15 inches. Under these climatic conditions, particularly when the precipitation is less than 15.75 inches per year, leachate is not formed in a landfill. Material brought to the facility is sorted, screened

and processed to ensure that the material is free of hazardous waste and putrescible material and/or liquids. CRS removes large quantities of drywall from the waste stream for recycling. No significant water will be available to percolate through the inert waste, nor to "pond" at any level within the refuse mass. ADEC requirements are met for an inert landfill with respect to the 10' minimum separation distance between the bottom of the refuse and the recorded historic high water table and no liner is required. Testing for potential contamination from the waste has occurred. EMI tested the residual material using the Synthetic Precipitation Leaching Procedures (SPLP) to check for potential contaminants of concern from the waste. This method is not used to test water for drinking water standards. It is designed to identify contaminants that may be of potential concern in waste water. Modeling results have indicated that there will be no contaminant plume extending down gradient from the landfill mass. Leachate modeling identified two potential contaminants of concern: sulfate and manganese. The results predict that the analytes will likely comply with ADEC's drinking water standards. The development of a vegetative cover will result in increased evaporation (evapotranspiration) and the minimal infiltration will be reduced as the landfill evolves, cell by cell. Establishment of the native ground cover

on the final cap of each cell will result in increased evapotranspiration and reduced potential for infiltration; and

WHEREAS, a total of ten cells will be constructed over the life of the monofill. The working face receiving the inert materials will comprise, at any one time, an area measuring 120' x 50'. Therefore, the surface of the monofill most vulnerable to infiltration by precipitation at any one time will be kept to a minimum; and

WHEREAS, the monofill is designed to minimize the moisture levels in the material so that the rate of decay and rot will be very slow and will not significantly impact any leachate, if there is any leachate at all that leaves the monofill; and

WHEREAS, ADEC regulations state that an unlined landfill may not be located closer than 10 feet above the highest measured level of an aquifer of resource value unless the landfill is constructed two feet or more above the natural ground surface (18 AAC 60.217); and

WHEREAS, under Alaskan administrative regulations, this proposed monofill is exempt from providing groundwater monitoring and corrective action to state agencies, as it is located in an area with 25 inches or less in total precipitation each year, per ADEC regulations (18 AAC 60.820(a)(8); and

WHERAS, CMS withdrew their groundwater monitoring plan from the application material. Staff is recommending that a

groundwater monitoring plan be required by the Borough Planning Commission and implemented in the conditional use permit; and

WHEREAS, the monofill is being designed so that a significant amount of leachate will not be produced; the groundwater level has been determined; no contaminant plume will extend down gradient from the monofill; and there will be minimal infiltration. A condition will be set to implement a groundwater monitoring plan at this site; and

WHEREAS, materials brought to the facility that have not been previously inspected will be deposited onto an impermeable pad for inspection, recyclable materials removed and the remaining non-recyclable material placed in the active monofill cell; and

WHEREAS, the applicant states that the following material will not be accepted at this monofill: PCBs or other hazardous wastes, household waste, putrescible waste, liquids, compressed gas cylinders, batteries, appliances with CFC/HCFC, animal carcasses, and petroleum contaminated materials; and

WHEREAS, Alaska Statutes 46.03.900(1) – defines "hazardous waste" as "A waste or combination of waste that because of quantity, concentration, or physical, chemical, or infectious characteristics may: cause or significantly contribute to, an increase in mortality or an increase in serious irreversible or incapacitating reversible illness; or pose a substantial present

or potential hazard to human health or the environment when improperly managed, treated, stored, transported, or disposed of"; and

WHEREAS, material haulers transporting any demolition and/or renovation material to a CRS facility or this monofill must provide the following documentation: (1) A copy of all Hazardous Building Material Surveys for each project that will be bringing their demolition and/or renovation material to the facility. Should the Survey indicate the presence of any hazard materials, then (2) a letter from the Contractor of each project is also submitted to CRS stating that all hazardous material has been properly removed from the project and there is no hazardous material being brought to the CRS facility. For their operations, CRS defines hazardous material as a material containing any percentage of asbestos; and

WHEREAS, Regulated Asbestos Containing Material (RACM) and Non-RACM will be accepted for disposal at the monofill in accordance with all applicable federal and state regulations for packaging, labeling, transport handling and disposal; and

WHERAS, materials that can be accepted at this monofill are described in the State of Alaska's Solid Waste Regulations, 18 AAC 60; and

WHEREAS, the Plan of Operations submitted to ADEC will prevent hazardous waste, as defined by the Federal government (40 CFR 261.3) from being placed in the monofill; and

WHEREAS, testing for potential contaminants from the waste has occurred; and

WHEREAS, leachate modeling identified two potential contaminants of concern: sulfate and manganese. The results predict that the analytes will likely comply with the ADEC's drinking water standards; and

WHEREAS, baseline data for water quality has been provided; and

WHEREAS, the site is less than one mile from the Palmer Hay Flats Refuge, which is a major migratory bird refuge in Southcentral Alaska; and

WHEREAS, with conditions, the proposed monofill should not be harmful to the public health, safety, convenience, and welfare; and

WHEREAS, ADEC regulations require that monofill waste be set back a minimum of 50 feet from all property lines; and

WHEREAS, no material will be placed or stockpiled within 25 feet of the industrial ponds on the site; and

WHEREAS, no waste will be placed within 100 feet of the industrial ponds on the site; and

WHEREAS, in addition to the monofill, two storage or shop buildings, a scale house, and field office are proposed for the site; and

WHEREAS, the site plan depicts the proposed structures in compliance with setback requirements; and

WHEREAS, the operation will be required to comply with the maximum permissible sound level limits in MSB Code, per the requirements of MSB 17.61.080 – Noise Standards and MSB 8.52 – Noise, Amplified Sounds, and Vibration; and

WHEREAS, the driveway to the site will be secured with a locked gate; and

WHEREAS, the site is monitored with camera security systems; and

WHEREAS, only approved contractors will be allowed to bring material to the facility. This is controlled by gates and on-site personnel that will inspect all loads delivered to the facility; and

WHEREAS, the public will not be allowed to drop off or dispose of material at the monofill; and

WHEREAS, the sale yard will be open to the public with controlled access; and

WHEREAS, with conditions, there will be adequate safeguards in place to prevent blowing debris and incidental trash onto adjacent properties and roadways. Additional conditions will be

set regarding the handling and storage of materials during wind events; and

WHEREAS, the application material adequately addresses the impacts of the climate, geology, hydrology and geography of the site and the impacts to surrounding land uses; and

WHEREAS, the conditional use does fulfill all other requirements of this chapter; and

WHEREAS, screening of the site will be accomplished by using the existing topography and berms, building up berms and installing site obscuring fencing.

NOW, THEREFORE, BE IT RESOLVED, that the Matanuska-Susitna Borough Planning Commission hereby finds this application does meet the standards of MSB 17.60.100 and 17.60.110 and hereby approves the conditional use permit for the operation of a monofill for the disposal of inert construction and demolition debris, including Regulated Asbestos-Containing Material (RACM) and Non-Regulated Asbestos-Containing Material (Non-RACM) and an outdoor storage yard for the sale of salvageable/recyclable materials on parcels 17N02E18C010 and 17N02E19B006 with the following conditions:

1. It is the responsibility of the property owner and operator to identify and comply with all applicable local, state, and federal regulations applicable to

this development and obtain all necessary authorizations and permits and update as appropriate.

2. Upon issuance of a permit under MSB Chapter 17.60, the permittee shall provide and maintain all necessary documentation to demonstrate continued compliance with permit conditions.

3. The property owner and the permittee shall be responsible for maintaining all aspects of the operation, improvements, and development, and the site in compliance with the terms and conditions of the permit and all applicable local, state, and federal requirements.

4. Authorized representative of the borough shall be allowed to inspect the site at reasonable times for the purpose of monitoring compliance with all permit conditions. Upon reasonable notice from the Borough, the permittee shall provide necessary assistance to facilitate authorized inspections.

5. Except as otherwise specified by code, the privileges and requirements of a conditional use permit shall run with the land, subject to the following requirements: Within 90 days of recording the transfer of ownership of the subject land, the new owner shall provide written notification and a signed acknowledgement that

the new owner assumes responsibility for compliance with the requirements of the permit.

6. If the operation expands or alters, an amendment to the conditional use permit shall be required.
7. The operation shall be limited to what is described in the development plan submitted to the Matanuska-Susitna Borough and the Plan of Operations submitted to the Alaska Department of Environmental Conservation.
8. An area no larger than 120' x 50' shall remain uncompacted at any one time.
9. The maximum square footage that shall be exposed and not covered at any one time during the monofill operation shall be 25,000 square feet.
10. At a minimum, the monofill material shall be covered with soil weekly.
11. Immediately after the tire bales used for the side walls are installed they shall be covered with topsoil and seeded for revegetation.
12. A remote weather station shall be installed at the site to monitor wind speed. The weather station shall be set up where the wind flows freely and is not influenced by nearby objects or topography.

13. When sustained wind conditions on the site exceed 10 mph, waste material shall not be deposited at the site.

14. When sustained wind speeds exceed 15 mph, all open areas shall be covered with soil, secured with tarps, or other appropriate measures until sustained winds decrease to less than 10 mph.

15. The applicant shall install catch fences downwind of active monofill cells at all times. The fencing mesh shall be a maximum of one inch (1") in size.

16. At the end of each day the stockpiled daily cover shall either be contained within a covered trailer or completely covered with tarps that are secured to ensure that material does not become airborne.

17. The site shall be monitored daily for windblown material. If materials are found to have blown off-site a corrective measures plan shall be submitted to the Borough for approval.

18. If material is windblown onto adjacent properties, reasonable attempts shall be made to obtain permission to gain access to these properties for debris removal

19. The site shall be visually screened on a year round basis from all traveled or public rights-of-way and

from the residential properties on the west side of the property.

20. The maximum finished elevation of the monofill shall not exceed 162 feet Above Sea Level.
21. Upon completion, the monofill shall be covered with two feet of topsoil, seeded, and sloped as described in the development plan.
22. Should the operation be modified as a result of the Glenn Highway Reconstruction Project, an updated site plan and plan of operations shall be submitted to the Borough.
23. The bottom of the monofill shall not be located closer than 12 feet above the seasonal high water table.
24. If it is found that groundwater has been contaminated, a corrective measures plan shall be submitted to the Borough for approval.
25. The Groundwater Monitoring Plan prepared for this site by TERRASAT, Inc., dated May 17, 2013, shall be implemented and maintained, except that a final laboratory report resulting from a release investigation shall be submitted to the Borough within 48 hours of receiving the report.

26. Materials that can be accepted at this monofill are described in the State of Alaska Solid Waste Regulations, 18 AAC 60.

27. The following materials shall not be accepted at this monofill: PCBs or other hazardous wastes, household waste, putrescible waste, liquids, compressed gas cylinders, batteries, appliances with CFC/HCFC, animal carcasses, and petroleum contaminated materials.

28. Materials brought to the facility that have not been previously inspected by qualified personnel shall be deposited onto an impermeable pad for inspection prior to being deposited in the active monofill cell.

29. If prohibited materials are found, they shall be properly handled and disposed of in accordance with all state and federal laws.

30. Regulated Asbestos Containing Material (RACM) and Non-RACM shall be handled and disposed of at the site in accordance with state and federal regulations for packaging, labeling, transport handling and disposal.

31. Monofill waste shall be set back a minimum of 50 feet from all property lines.

32. No waste shall be placed or stockpiled within 100 feet of the industrial ponds on the site.

33. Only previously approved haulers shall be allowed to bring material to the facility.

34. The operation shall comply with the maximum permissible sound level limits allowed in MSB Code, per the requirements of MSB 17.61.080 – Noise Standards and MSB 8.52 – Noise, Amplified Sounds, and Vibration.

35. The site shall be gated and locked when not in operation. All visitors to the site must check in with personnel.

36. Hours of operation shall be limited to 7 a.m. to 7 p.m., Monday through Saturday, May through September and 8 a.m. to 5 p.m., Monday through Saturday, October through April.

37. Environmental and Pollution Insurance shall be maintained in the amount of $1 million single with a minimum $5 million aggregate.

38. This conditional use permit shall expire December 31, 2020.

39. The owner shall provide copies of all permits issued by state and federal agencies to the Matanuska-Susitna Borough prior to commencement of the permitted use. The owner shall also provide to the borough a copy of

every application for an amendment to any such permit at the time the application is filed with the permitting agency, and a copy of any amendment approved by the permitting agency shall be provided to the borough within five days of issuance.

40. This permit has been approved by the Matanuska-Susitna Borough Planning Commission. The decision may be appealed within 21 days of the date of approval by the Planning Commission in accordance with MSB 15.39 – Board of Adjustment and Appeals.

ADOPTED by the Matanuska-Susitna Borough Planning Commission this ___ day of ___, 2014.

JOHN KLAPPERICH, Chair

ATTEST

MARY BRODIGAN, Planning Clerk

(SEAL)

YES: Klapperich, Walden, and Rauchenstein.

NO: Endle, Healy, and Adams.

The regular meeting of the Matanuska-Susitna Borough Planning Commission was held on December 1, 2014, at the Matanuska-Susitna Borough Assembly Chambers, 350 E. Dahlia Avenue, Palmer, Alaska. The meeting was called to order at 6:00 p.m. by Chair John Klapperich.

I. CALL TO ORDER, ROLL CALL, AND DETERMINATION OF QUORUM

Planning Commission members present and establishing a quorum:

Mr. Brian Endle, Assembly District #1
Mr. Thomas Healy, District #2
Mr. John Klapperich, Assembly District #3 *Chair*
Mr. William Kendig, Assembly District #5
Mr. Vern Rauchenstein, District #7

Planning Commission members absent were:

Mr. Bruce Walden, Assembly District #4
Mr. Tomas Adams, Assembly District #6

Staff in attendance:

Mr. Alex Strawn, Development Services Manager
Ms. Lauren Driscoll, Planning Services Chief
Mr. John Aschenbrenner, Deputy Attorney
Ms. Laura Newton, Assistant Borough Attorney
Ms. Lonnie McKechnie, Borough Clerk
Ms. Susan Lee, Planner II
Ms. Pamela Graham, Grants & Project Coordinator
Ms. Mary Brodigan, Planning Commission Clerk

II. APPROVAL OF AGENDA

Chair Klapperich inquired if there were any changes to the agenda.

GENERAL CONSENT: The agenda was approved without objection.

III. PLEDGE OF ALLEGIANCE

The pledge of allegiance was led by Assemblymember Matthew Beck.

IV. CONSENT AGENDA

A. Minutes

(There were no minutes available.)

A. INTRODUCTION FOR PUBLIC HEARING: QUASI-JUDICIAL MATTERS

(There were introductions for quasi-judicial matters.)

B. INTRODUCTION FOR PUBLIC HEARING: LEGISLATIVE MATTERS

1. **Resolution 14-35**, a resolution recommending modifications to the proposed Tall Structures Ordinance to be consistent with recent changes in Federal Regulations. Public Hearing: December 15, 2014. *(Staff: Alex Strawn)*

Chair Klapperich read the consent agenda into the record.

Chair Klapperich inquired if there were any changes to the consent agenda.

GENERAL CONSENT: The consent agenda was approved without objection.

V. COMMITTEE REPORTS

(There were no committee reports.)

VI. AGENCY/STAFF REPORTS

(There were no agency or staff reports.)

VII. LAND USE CLASSIFICATIONS

(There were no land use classifications.)

VIII. AUDIENCE PARTICIPATION (Three minutes per person.)

The following person spoke regarding public process: Mr. Eugene Haberman.

IX. PUBLIC HEARING: QUASI-JUDICIAL MATTERS *(Public Hearing not to begin before 6:15 P.M.)*

Commission members may not receive or engage in ex-parte contact with the applicant, other parties interested in the application, or members of the public concerning the application or issues presented in the application.

A. **Resolution 14-33**, a resolution approving a Conditional Use Permit, in accordance with 17.60.030 Permit Required, for the operation of an Inert Material Monofill on MSB Parcels 17N02E18C010 and 17N02E19B006. *(Applicant: CMS)*

Chair Klapperich read the resolution title into the record.

Chair Klapperich:

- read the standard memorandum into the record regarding quasi-judicial actions;
- queried commissioners to determine if any of them have a financial interest in the proposed Conditional Use Permit (CUP);
- have had any ex parte contact with the applicant, members of the public, or interested parties in the proposed CUP; and

- if all commissioners are able to be impartial in a decision.

Commissioner Kendig:
- stated that he has not done business with the applicant, but has done business with a sister corporation of theirs;
- he sold recyclables to them; and
- stated that he doesn't feel that he has a conflict in hearing this application.

Mr. John Aschenbrenner, Deputy Borough Attorney, asked Commissioner Kendig to explain the nature of his relationship with the sister corporation.

Commissioner Kendig:
- stated that they are not his main buyer, but he has done business with them in the past when they offered a higher price for his scrap metal;
- opined that it was a similar situation as with the CUP for the 49th Street recycling business; and
- the last time he did business with them was late summer or early fall of this year.

Mr. Aschenbrenner:
- referred to MSB 2.71.080 which states that a municipal official shall recuse himself from acting on a matter or proceeding if they have done business with the applicant within a twelve month period;
- opined that based on the bright line rule set by the MSB Assembly, it appears that Mr. Kendig has a conflict since he did business with an arm of the applicants business within the last few months; and
- urged the commission to allow the applicant to question Commissioner Kendig.

Mr. Bill Ingaldson;
- stated that he is the attorney representing CMS;
- based on the business dealing as described by Commissioner Kendig, opined that they are not an ongoing client of Commissioner Kendig;
- it is no different than if someone were to purchase tires from Target;
- opined that borough code is intended to address an issue of an ongoing regular relationship.

Chair Klapperich asked Commissioner Kendig if he can be impartial in this decision.

Commissioner Kendig stated that he spent hours and hours reviewing the material, and that he feels that he can be impartial.

Mr. Aschenbrenner:
- stated that code does not have a provision for trying to surmise the scope of the client relationship;
- the Assembly has set a bright line rule that no official is supposed to sit when they have interacted with an applicant within the proceeding twelve months;
- acknowledged the applicant's argument with regards to this matter, but stated that it's not code; and

- urged the commission to follow code and lodge an objection so as not to build an error into the record.

Chair Klapperich suggested that the business transaction was small and insignificant, and questioned if there is a level on the amount of substantial financial interest.

Mr. Aschenbrenner:
- stated that there is a separate ethics provision that deals with substantial financial interest;
- opined that the provision that the Chair is referring to would also disqualify a commission member from sitting; and
- Commissioner Kendig clearly stated that the applicant was his client just three months ago.

Commissioner Kendig:
- stated that he did not do business with CMS, but with Central Recycling Services (CRS) which is a separate corporation; and
- acknowledged that some of the same people may be involved in the different corporations.

Mr. Stuart Jacques, President of Central Monofill Services:
- stated that the important issue is the term client;
- client implies a fiduciary relationship between the parties; and
- opined that this is not the case in this matter.

Mr. Aschenbrenner:
- referred to an email from Mr. Shane Durand on page 2138 of the packet which clarifies the relationship between the corporations;
- it states that CRS owns and operates the recycling facilities and holds the contract with CMS to run the monofills;
- the last line of the email states "separate companies, same owners"; and
- cautioned the commission once again that they may be building an error into the record.

Discussion ensued as to whether Commissioner Kendig should be recused.

Chair Klapperich asked the commission if there is any objection to allowing Commissioner Kendig participate in the vote to remain sitting.

Commissioner Endle objected.

Mr. Aschenbrenner stated that once Commissioner Kendig made a decision not to recuse himself, it would not be appropriate for him to vote on whether he should be recused.

Discussion ensued regarding the commission voting on whether or not Commissioner Kendig should be recused.

Chair Klapperich called for a five minute recess to confer with the Borough Clerk and the Planning Commission Clerk.

(*The meeting recessed at 7:10 p.m., and reconvened at 7:20 p.m.*)

MOTION: Commissioner Healy made a motion to ask the commission if Commissioner Kendig should remain sitting for Resolution 14-33. The motion was seconded.

VOTE: The motion failed by a vote of three to one with Commissioner Endle in opposition. (Four affirmative votes are required to pass)

(Commissioner Kendig exited the meeting at 7:30 p.m.)

Chair Klapperich:
- stated that he will open the public hearing this evening so that everyone in attendance that would like to speak can speak;
- recommended that the public hearing be continued to the next meeting so that Commissioners Adams and Walden can participate; and
- will ask them to listen to the audio of the meeting so that they will be up to speed.

Mr. Ingaldson:
- opined that the commission made a mistake with the way that they handled Commissioner Kendig; and
- requested that the full public meeting be postponed until the next meeting so that the two commissioners that are absent can participate.

Mr. Aschenbrenner stated that the commissioners that are absent can participate in the discussion at the next meeting if they review the record and listen to the audio recording.

Chair Klapperich asked if there was any objection to continuing the public hearing.

There was no objection noted.

Mr. Jacques requested that they give their presentation at the next meeting.

Mr. Aschenbrenner stated that it is not normal for the public to comment prior to the applicant providing their overview.

Mr. Alex Strawn, Development Services Manager, stated that it is a normal part of the procedure for the applicant to give a presentation before the public hearing and then to respond to comments after the public hearing is closed.

Ms. Susan Lee and Mr. Strawn provided a staff report:
- staff recommended approval of the resolution with conditions.

Commissioner Healy referred to page 66 of the packet and questioned whether ADEC has approved the application.

Ms. Lori Aldridge, Alaska Department of Environmental Conservation (ADEC), Solid Waste Program:

- ADEC has declared that the application is complete and sent it out for public notice;
- there was an error in the first public notice and it was sent out for a second public notice which will remain open until December 29th; and
- at that time ADEC will review and analyze the information collected and will produce a decision document which will respond to all of the comments.

Commissioners questioned staff regarding the proposed Glenn Highway expansion and whether it will result in the applicant being subject to another public hearing and review.

Mr. Stuart Jacques, President of CMS, provided an overview of their application.

Commissioners questioned the applicant regarding:

- where the cover material will come from;
- what are the standards for long term monitoring of sites and who is responsible for monitoring;
- requested that Mr. Jacques present his recommendations for conditions;
- what is the perfect score that the applicant referred to; and
- clarification of the applicants statement that there will be little or no water that will leach.

Chair Klapperich opened the public hearing.

The following people spoke in favor of Resolution 14-33: Mr. Charles Homan, Mr. Landen Lovell, Mr. Paul Weir, Mr. Brian Goodman, Mr. Fred Thompson, Mr. Wes Walling, and Mr. Caleb Moffitt.

The following people spoke in opposition of Resolution 14-33: Ms. Rose Williams, Mr. Craig Kelly, Ms. Sarah Mayfield, Ms. Bonnie Kelly, Mr. Richard Harbuck, Vice President Gateway Community Council, Ms. Robin Bumgardner, Mr. Charles Young, Ms. Samantha Oslund, Mr. Bill Quantick, Mr. Ben VanderWeele, Mr. John Stuart, Ms. DeLena Johnson, City of Palmer Mayor, Ms. Diane Warta, Mr. Arthur Keyes, Mr. Kent Johnson for Rosanne Leiner, Ms. Vicky Ramage for Rachel Garnett, Ms. Lisa Kallander, Mr. Jesse Saxton, Mr. Joe Moore, Mr. Dennis Wetherell, Mr. Don Berberich, Mr. Kent Johnson, Mr. Gabe Jenkins, Mr. Johnnie Davis, Ms. Sarah Walcott, Ms. Judy Crosby, and Ms. Linea Crosby for Mr. Norman Crosby.

The following person spoke regarding Resolution 14-33: Ms. Lori Aldrich, Regional Program Manager for the Solid Waste Program of ADEC.

The following person spoke regarding the public process for Resolution 14-33: Mr. Eugene Haberman.

(*The meeting recessed at 10:26 p.m., and reconvened at 10:33 p.m.*)

The following people spoke in opposition of Resolution 14-33: Ms. Stephanie Nowers, Mr. Chris Kepler, Assemblymember Matthew Beck, Mr. Paul Johnson, Mr. James Munter, Hydrogeologist for J.A. Munter Consulting, Inc., Ms. Kathy Jo Johnson, Mr. Scott Wells.

The following person spoke in favor of Resolution 14-33: Mr. Nate Kruk.

Chair Klapperich invited the applicant to respond to comments and statements made by the public.

Mr. Stuart Jacques responded to comments and statements made by the public.

Mr. Alex Strawn responded to a statement made by Mr. Jacques regarding a staff site visit to the Birchwood site.

MOTION: Commissioner Healy moved to continue the public hearing until December 15, 2014. The motion was seconded.

Discussion ensued regarding not accepting new information that is received after noon the Friday before the Planning Commission meeting.

Chair Klapperich stated that no new material should be accepted and provided to the commission if it is received after 12:00 noon the Friday before the meeting.

VOTE: The motion to continue the public hearing for Resolution 14-33 passed without objection.

X. PUBLIC HEARING LEGISLATIVE MATTERS

(There were no legislative public hearings.)

XI. CORRESPONDENCE AND INFORMATION

(There was no correspondence and information.)

XII. UNFINISHED BUSINESS

(There was no unfinished business.)

XIII. NEW BUSINESS

(There was no new business.)

XIV. COMMISSION BUSINESS

A. Upcoming Planning Commission Agenda Items

Mr. Strawn provided a brief update on projects that will be coming before the Planning Commission.

XV. DIRECTOR AND COMMISSIONER COMMENTS

Commissioner Rauchenstein:

- thanked all the people for showing up;
- acknowledged that we have all built our homes and created waste;
- questioned where everyone puts their waste;
- stated that he puts his waste in the dump;
- CMS is trying to make use of the waste; and
- opined that this is a difficult decision.

Chair Klapperich:

- stated that he is encouraged by the participation in this process;
- we have to figure out ways to take care of our communities and our water and our air;
- we have to work together to find the best solution;
- stated that he is committed to doing this; and
- he appreciates the applicants patience and the boroughs patience.

XVI. ADJOURNMENT

The regular meeting adjourned at 11:22 p.m.

JOHN KLAPPERICH, Planning Commission Chair

ATTEST:

MARY BRODIGAN, Planning Commission Clerk

Minutes approved: March 2, 2015

The regular meeting of the Matanuska-Susitna Borough Planning Commission was held on December 15, 2014, at the Matanuska-Susitna Borough Assembly Chambers, 350 E. Dahlia Avenue, Palmer, Alaska. The meeting was called to order at 6:00 p.m. by Chair John Klapperich.

I. CALL TO ORDER, ROLL CALL, AND DETERMINATION OF QUORUM

Planning Commission members present and establishing a quorum:

Mr. Brian Endle, Assembly District #1
Mr. Thomas Healy, District #2
Mr. John Klapperich, Assembly District #3 *Chair*
Mr. Bruce Walden, Assembly District #4 (*attended the meeting telephonically until his arrival at 6:25 p.m.*)
Mr. William Kendig, Assembly District #5
Mr. Tomas Adams, Assembly District #6 (*arrived at 6:57 p.m.*)
Mr. Vern Rauchenstein, District #7

Staff in attendance:

Ms. Eileen Probasco, Planning & Land Use Director
Mr. Alex Strawn, Development Services Manager
Ms. Lauren Driscoll, Planning Services Chief
Mr. John Aschenbrenner, Deputy Attorney
Ms. Laura Newton, Assistant Borough Attorney
Ms. Susan Lee, Planner II
Ms. Pamela Graham, Grants & Project Coordinator
Ms. Mary Brodigan, Planning Commission Clerk

II. APPROVAL OF AGENDA

Chair Klapperich inquired if there were any changes to the agenda.

GENERAL CONSENT: The agenda was approved without objection.

III. PLEDGE OF ALLEGIANCE

The pledge of allegiance was led by Assemblymember Matthew Beck.

IV. CONSENT AGENDA

A. Minutes

(*There were no minutes available.*)

B. 2015 Planning Commission Meeting Schedule

C. INTRODUCTION FOR PUBLIC HEARING: QUASI-JUDICIAL MATTERS

(*There were no introductions for quasi-judicial matters.*)

D. INTRODUCTION FOR PUBLIC HEARING: LEGISLATIVE MATTERS

(*There were no introductions for legislative matters.*)

GENERAL CONSENT: The consent agenda was approved without objection.

V. COMMITTEE REPORTS

(*There were no committee reports.*)

VI. AGENCY/STAFF REPORTS

(There were no agency or staff reports.)

VII. LAND USE CLASSIFICATIONS

(There were no land use classifications.)

VIII. AUDIENCE PARTICIPATION (Three minutes per person.)

The following person spoke regarding Meadow Lakes Community SpUD: Mr. Phil Bindon.

The following person spoke regarding public meeting process: Mr. Eugene Haberman.

IX. PUBLIC HEARING: QUASI-JUDICIAL MATTERS *(Public Hearing not to begin before 6:15 P.M.)*

Commission members may not receive or engage in ex-parte contact with the applicant, other parties interested in the application, or members of the public concerning the application or issues presented in the application.

A. **Resolution 14-33**, a resolution approving a Conditional Use Permit, in accordance with 17.60.030 Permit Required, for the operation of an Inert Material Monofill on MSB Parcels 17N02E18C010 and 17N02E19B006. (*Continued from the December 1, 2014 Meeting. Applicant: CMS)*

Chair Klapperich asked Commissioner Kendig if he has any new information to add that was not previously disclosed.

Commissioner Kendig stated that he has nothing additional to add.

(*Commissioner Kendig exited the meeting at 6:15 p.m.*)

Chair Klapperich read the resolution title into the record.

Chair Klapperich:
- read the standard memorandum into the record regarding quasi-judicial actions;
- queried commissioners to determine if any of them have a financial interest in the proposed Conditional Use Permit (CUP);
- have had any ex parte contact with the applicant, members of the public, or interested parties in the proposed CUP; and
- if all commissioners are able to be impartial in a decision.

Chair Klapperich:
- reminded everyone that this is a continuation of the public hearing opened on December 1, 2015;
- stated that those that have not testified will be allowed to speak first;
- those that have already testified may have an opportunity to speak again if time permits; and
- the applicant will have an opportunity to respond after the conclusion of the public hearing.

(*Commissioner Walden arrived at 6:25 p.m.*)

Chair Klapperich asked Commissioner Walden if he had listened to the audio recording from the December 1, 2014, Planning Commission meeting.

Commissioner Walden responded that he listened to the recording and reviewed the record.

Chair Klapperich read the standard memorandum regarding quasi-judicial actions, and asked Commissioner Walden if he could be impartial in this decision.

Commissioner Walden responded "yes".

Mr. Ingaldson, Attorney for CMS:
- stated that he has concerns regarding the recusal of Commissioner Kendig;
- noted that Commissioner Rauchenstein had filed a written motion to reconsider the motion to recuse Commissioner Kendig;
- acknowledged that Commissioner Rauchenstein may have decided not to bring the motion forward; and
- stated that he would like it on the record.

Commissioner Rauchenstein:
- stated that he had intended to rethink the recusal of Commissioner Kendig; and
- he changed his mind after reading the letter from the borough attorney which said that there had been ex parte contact between Commission Kendig and the applicant.

Chair Klapperich continued the public hearing.

The following people spoke in opposition of Resolution 14-33: Mr. Ken Smith, Mr. Stan Gillespie of the Gateway Community Council, Mr. Aaron Kallas, and Mr. Mark Drake.

The following people spoke regarding the history of the site and the involvement of the Alaska Department of Natural Resources (ADNR): Mr. Charlie Cobb, State Dam Safety Engineer in the Water Resources Section, and Mr. David Schade, Water Resources Section Chief in the Division of Mining, Oil, and Water.

(*Commissioner Adams entered the meeting at 6:57 p.m.*)

Chair Klapperich asked Commissioner Adams if he had listened to the audio recording and reviewed the record from the December 1, 2014, Planning Commission meeting.

Commissioner Adams responded that he had listened to the recording and reviewed the record.

Chair Klapperich read the standard memorandum regarding quasi-judicial actions, and asked Commissioner Adams if he could be impartial in this decision.

Commissioner Adams responded "yes".

The following people spoke in opposition of Resolution 14-33:, Mr. David Gilley, Ms. Michelle Roundtree, Mr. Norman Crosby for Ms. Linea Crosby, Mr. Chris Sahlstrom, Mr. John Rozzi, Ms. Evelyn Bunch, Ms. Barbara Landi, Mr. David Palmer, Mr. Eric Quam, Ms. Marie Payne, Ms. Helen Hoffman, Mr. Samuel Raynovic, Ms. Stephanie Nowers for her husband, Stephen Nowers, Mr. Tony Bluma, Mr. Tony Sellen, Ms. Kellie Ballard-Chambers, Mr. Jeffrey Vincent, Mr. Jim Cassidy, Mr. Barry Orzalli, and Ms. Heather Orzalli.

The following person spoke in favor of Resolution 14-33: Mr. Larry Helgeson, Design Engineer for the monofill.

(*The meeting recessed at 8:00 p.m., and reconvened at 8:10 p.m.*)

The following people spoke in opposition of Resolution 14-33:, Mr. Jesse Hronkin, Ms. Melodie Wright, Mr. Emmitt Leffel, Ms. Gerry Keeling, Mr. Ray Jeffers, Mr. Joe Hannan, City Manager of Palmer, Mr. Ben VanderWeele for Mr. Roger VanderWeele, Mr. Romie Deschamps, Mr. Rick Fleming, Mr. Cheyenne Guard, Ms. Stephanie Figon, Ms. Melanie Glatt, Ms. Emily Longbrake of the Alaska Community Action on Toxics, Ms. Peggy Egelus, Mr. Bill Longbrake, Mr. Murph O'Brien, Ms. Rachel Gernat, Ms. Judy Crosby, Ms. Bonnie Kelly, Mr. Joe Moore, Mr. Sarah Wolcoff, Mr. Dave Jenkins, Ms. Diane Warta, Mr. Kent Johnson, Mr. Bill Quantick, Ms. Stephanie Nowers, Mr. Joe Figon, and Ms. Kristen Lewis.

The following people spoke in favor of Resolution 14-33: Ms. Donna Mears, Mr. Grant Goulet, Mr. Glen Price, and Mr. Bill Ingaldson.

The following person spoke regarding public process: Mr. Eugene Haberman.

Chair Klapperich invited the applicant to respond to questions and statements made by members of the public.

Mr. Stuart Jacques, President of CMS:

- introduced Mr. Dan Young of TERRASAT, Inc. and Mr. Larry Helgeson of Environmental Management, Inc.;
- responded to questions and statements from public testimony and ADNR; and
- suggested changes that he would like to see to the proposed conditions.

Chair Klapperich invited staff to respond to questions and statements from public testimony.

Mr. Alex Strawn suggested changes to proposed conditions in response to comments made by the public.

There being no one else to be heard, Chair Klapperich closed the public hearing and discussion moved to the Planning Commission.

Commissioners questioned the applicant regarding:

- status of the ADEC permit;
- what happens after the monofill is filled up and closes, and who is the responsible party;
- who has the obligation if the property is sold;
- how will the Glenn Highway expansion affect the monofill plan specifically with a proposed intersection;
- clarification of reclamation requirements with regards to pre-existing legal nonconforming rights;
- how much of Cell A and G will be available if the proposed highway intersection goes in;
- clarification of the discrepancy of how long the groundwater will be monitored after the monofill closes;
- clarification of how much top soil and silt will be provided as coverage;
- what changed in the design plans requiring the maximum finished elevation in the monofill to go from a maximum of 150 feet in elevation to 162 feet;
- will the cells be filled in the order of how they are named (A, B,C, etc.); and
- how will the site be screened from the highway if the berm is removed.

(*The meeting recessed at 10:42 p.m., and reconvened at 10:48 p.m.*)

MOTION: Commissioner Walden moved to approve Resolution 14-33. The motion was seconded.

Commissioner Healy:

- stated that he has serious concerns about this application, the location, and its compliance with the comprehensive plan;
- opined that this is a health and safety issue;
- the commission has heard overwhelming testimony from the public, the city of Palmer, community councils, and Home Owner Associations (HOAs);
- referred to the Core Area Plan and reuse of gravel pits going towards light industrial;
- has a major concern that there are lots of gravel sites in the area and allowing this type of use in this area will set a precedent;
- concerned about the AKDOT plans for the Glenn Highway Expansion and opined that this needs to be taken into consideration; and

- noted that any changes to the monofill plan will be an administrative decision.

Commissioner Endle:

- stated that he was not in favor of the initial application;
- he is looking for something from the applicant showing that they have resolved issues with the water table, ponds, and the wind;
- does not see that in the application;
- acknowledged that the applicant does not have to be a good neighbor, but does have to fulfill the requirements;
- there wasn't enough data to show that the water table will rise or fall, but opined that it is unstable;
- acknowledged the amount of testimony stating that the water levels have risen;
- the applicant has not proven that they meet the qualifications for the permit;
- does not buy that this is considered an arid climate;
- questioned the lack of a liner and that the applicant does not want to modify the design; and
- stated that he is not in favor of granting the permit.

Commissioner Walden:

- acknowledged the concerns of his fellow commissioners and the concerns of the people in attendance;
- Alaska has been in an economic bubble due to oil;
- opined that the bubble just burst due to the Saudis flooding the market with cheap oil;
- income for Alaskans will start to drop;
- stated that he is in favor of 10, 15 or 30 jobs; and
- suggested that the commission consider that there are hard times coming.

Commissioner Rauchenstein requested that the applicant be required to increase the amount of insurance that they purchase to adequately cover any problem that may occur.

Commissioner Adams:

- acknowledged that no matter what decision the commission makes, there will be someone that is unhappy;
- he is an engineer and understands some of the science, but opined that there is a lot of information that requires additional expertise;
- the applicants hydrologist said there is no risk and the borough's hydrologist says that there is risk;
- ADEC has the scientists and engineers with the background to pick this application apart;
- opined that it's unfortunate that they have not issued their permit which would contain certain stipulations;
- noted that code states that granting a permit will not be harmful to the public; and
- stated that he doesn't know if he has the expertise to vote on this permit.

Commissioner Rauchenstein:

- opined that many of the standards of ADEC and the EPA (Environmental Protection Agency) are arbitrary;
- stated that he lives in Talkeetna and the water was just fine;
- the EPA changed their standards requiring Talkeetna to upgrade their water system; and
- they recently relaxed their standards after the people of Talkeetna spent about a million dollars to upgrade their water system.

Chair Klapperich:

- highly agrees with Commissioner Adams;
- the more he read, the more that he realized what he didn't know;
- states that due to the fact that this is a quasi-judicial action, he was not able to talk to the engineer, or the applicant, to borough staff, visit Chugiak or Anchorage sites, or research what worked in the Lower 48; and
- if borough staff recommends approval with 40 conditions, opined that it is not his place to overrule them.

Commissioner Healy:

- referred to the lengthy whereas statement regarding the leachate issue that begins on page 2,153 of the packet and goes to page 2,154;
- opined that the whereas statement is almost word for word information provided by the applicants engineers;
- is concerned with the amount of disagreement between experts regarding hydrology;
- the borough hauls about 1.6 million gallons of leachate out of the central landfill which is the same climate as the monofill; and
- acknowledged that this is like comparing apples to apples, but considering the risk to groundwater, stated that he cannot support this resolution.

Commissioner Adams:

- referred to emails from DEC and questioned where they will go when they review the application;
- DEC has pointed out questions in the application;
- they noted that there was nothing in the application referring to adding fill to obtain the proper groundwater separation;
- the DEC permit requires that the owner provide adequate bonding and financial assurances, and commented that CMS has not done this;
- they also stated that they will not demand this until the permit is either issued or denied;
- stated that the email from DEC was what caused him to be concerned over the actual design of the landfill;
- the commission does not have the expertise to say if the landfill should or should not be lined;
- Mr. Helgeson made a statement that the lining may cause more harm than good;
- DEC has the scientists and engineers that have the expertise to determine if the monofill should be lined;
- would like the commission to be able to review the DEC permit to see what their conditions are and to fully understand DECs concerns regarding the design of the landfill

and if there is appropriate bonding and insurance should something go wrong and a body of water is polluted;
- stated that he is having a hard time supporting this application and suggested that the applicant pull it until they have the permit from DEC; and
- suggested changing the 30-year expiration date to five years which is in line with the limits suggested by DEC.

MOTION: Commissioner Adams moved a primary amendment to Condition of Approval number 38 for the Conditional Use Permit to expire on December 31, 2020. The motion was seconded.

VOTE: The primary amendment passed with Commissioners Endle and Healy in opposition.

Commissioner Adams:
- stated that there are a number of conditions of approval that he would amend if he had the expertise;
- went back to his original statement that DEC has the expertise; and
- will not be attempting to modify additional conditions because he doesn't know if he will be making them better or not.

MOTION: Commissioner Rauchenstein moved a primary amendment to Condition number 21 by changing 2 feet of topsoil to 18 inches of silt and 6 inches of topsoil.

VOTE: The primary amendment died due to lack of a second.

MOTION: Commissioner Rauchenstein moved a primary amendment to change Condition number 23 to state not closer than 12 feet instead of 10 feet.

VOTE: The primary amendment died due to lack of a second.

MOTION: Commissioner Endle moved to close debate and to vote on the main motion. The motion was seconded.

VOTE: The motion passed without objection.

VOTE: The main motion to approve Resolution 14-33 failed with Commissioners Endle, Adams, and Healy in opposition.

Mr. Aschenbrenner:
- stated that he is here on behalf of staff;
- even though the motion did not garner a majority vote, the commission's decision must include findings of fact and conclusions of law;
- the commission has in the past used the 30-day time frame allowed under MSB 17.60.040 to come forward with findings and conclusions; and
- acknowledged the late hour, but encouraged the commission to adopt finding.

Discussion ensued regarding:

- all commissioners, whether they voted in favor or against the permit, should come up with findings of facts and conclusions of law supporting the denial of Resolution 14-33; and
- the findings will be submitted via email to the clerk by 5:00 p.m. on December 22nd for inclusion in the January 5th meeting packet.

MOTION: Commissioner Adams moved to continue the adoption of findings of fact and conclusions of law to the regular meeting on January 5, 2015, and submitting draft findings of fact and conclusions of law to the clerk by 5:00 p.m. on December 22, 2014. The motion was seconded.

VOTE: The motion to continue the adoption of findings of fact and conclusions of law to the January 5, 2015, regular meeting passed without objection.

MOTION: Commissioner Healy moved to postpone all remaining business to the January 5, 2015, regular meeting. The motion was seconded.

VOTE: The motion to postpone all remaining business to the January 5, 2015, regular meeting passed without objection.

X. PUBLIC HEARING LEGISLATIVE MATTERS

A. **Resolution 14-35**, a resolution recommending modifications to the proposed Tall Structures Ordinance to be consistent with recent changes in Federal Regulations.

XI. CORRESPONDENCE AND INFORMATION

A. BOAA Case 14-01, Notice of Right to Appeal and Final Order (*Pertaining to PC Resolution 14-21, Sky Ranch Setback Variance*)

XII. UNFINISHED BUSINESS

XIII. NEW BUSINESS

XIV. COMMISSION BUSINESS

A. School Site Selection Committee - PC Representative 2 - Commissioner Kendig Term 12/31/14

B. Upcoming Planning Commission Agenda Items

XV. DIRECTOR AND COMMISSIONER COMMENTS

XVI. ADJOURNMENT

The regular meeting adjourned at 11:57 p.m.

JOHN KLAPPERICH, Planning Commission Chair

ATTEST:

MARY BRODIGAN, Planning Commission Clerk

Minutes approved: March 2, 2015

The regular meeting of Matanuska-Susitna Borough Planning Commission was held on January 5, 2015, at the Matanuska-Susitna Borough Assembly Chambers, 350 E. Dahlia Avenue, Palmer, Alaska. The meeting was called to order at 6:00 p.m. by Chair John Klapperich.

I. CALL TO ORDER, ROLL CALL, AND DETERMINATION OF QUORUM

Planning Commission members present and establishing a quorum:

Mr. Brian Endle, Assembly District #1
Mr. Thomas Healy, District #2
Mr. John Klapperich, Assembly District #3 *Chair*
Mr. Bruce Walden, Assembly District #4 (*arrived at 6:16 p.m.*)
Mr. William Kendig, Assembly District #5
Mr. Tomas Adams, Assembly District #6
Mr. Vern Rauchenstein, District #7

Staff in attendance:

Mr. Alex Strawn, Development Services Manager
Ms. Lauren Driscoll, Planning Services Chief
Mr. John Aschenbrenner, Deputy Attorney
Ms. Laura Newton, Assistant Borough Attorney
Ms. Shannon Bodolay, Assistant Borough Attorney
Ms. Mary Brodigan, Planning Commission Clerk

II. APPROVAL OF AGENDA

Chair Klapperich inquired if there were any changes to the agenda.

GENERAL CONSENT: The agenda was approved without objection.

III. PLEDGE OF ALLEGIANCE

The pledge of allegiance was led by Mr. Mike Koskovich, a member of the audience.

IV. CONSENT AGENDA

A. Minutes

(There were no minutes available.)

A. INTRODUCTION FOR PUBLIC HEARING: QUASI-JUDICIAL MATTERS

1. **Resolution 15-03**, a Conditional Use Permit in accordance with MSB 17.27 - Sutton Special Land Use District, for the construction and operation of a private outdoor shooting range, located within Township 19 North, Range 3 East, Section 32, Parcel B006; Tax ID# 19N03E32B006, Seward Meridian. Public Hearing: February 2, 2014. (*Applicant: J-TAC, LLC, Staff: Mark Whisenhunt*)

2. **Resolution 15-04**, a Conditional Use Permit in accordance with MSB 17.70 - Regulation of Alcoholic Beverage Uses, for the operation of an alcoholic dispensary (bar) at the 907 Club, located within Township 17 North, Range 3 West, Section 21; Tax ID# 54280000T00A, Seward Meridian. Public Hearing: February 2, 2014. (*Applicant: Nine Oh Seven, Inc., Staff: Mark Whisenhunt)*

B. INTRODUCTION FOR PUBLIC HEARING: LEGISLATIVE MATTERS

1. **Resolution 15-02**, a resolution recommending Assembly approval of a route selection for the Seldon Road Extension, Phase II. Public Hearing: February 2, 2015. (*Staff: Michael Campfield*)

Chair Klapperich read the consent agenda into the record.

Chair Klapperich inquired if there were any changes to the consent agenda.

GENERAL CONSENT: The consent agenda was approved without objection.

V. COMMITTEE REPORTS

(There were no committee reports.)

VI. AGENCY/STAFF REPORTS

(There were no agency/staff reports.)

VII. LAND USE CLASSIFICATIONS

(There were no land use classifications.)

VIII. AUDIENCE PARTICIPATION (Three minutes per person.)

The following people spoke regarding the Meadow Lakes Community Draft SpUD: Mr. Mike Koskovich, Ms. Linda Conover, Mr. Charles Center, Mr. Mike Sweeley, and Mr. Jon Spiegel.

Commissioner Walden arrived at 6:16 p.m.

The following person spoke about a commissioner possibly having a conflict of interest the CMS Inert Material Monofill CUP application: Mr. Glen Price.

The following person spoke regarding thanking the commissioners for their hard work on the CMS Inert Material Monofill CUP application: Ms. Stephanie Nowers.

IX. PUBLIC HEARING: QUASI-JUDICIAL MATTERS *(Public Hearing not to begin before 6:15 P.M.)*

Commission members may not receive or engage in ex-parte contact with the applicant, other parties interested in the application, or members of the public concerning the application or issues presented in the application.

(There were no quasi-judicial public hearings.)

X. PUBLIC HEARING LEGISLATIVE MATTERS

A. **Resolution 14-35**, a resolution recommending modifications to the proposed Tall Structures Ordinance to be consistent with recent changes in Federal Regulations. *Continued from the December 15, 2014, meeting. (Staff: Alex Strawn)*

Commissioner Endle stated that he works for MTA and asked that he be recused from the public hearing for Resolution 14-35, modifications to the Tall Structures Ordinance.

There was no objection noted.

(*Commissioner Endle left the room at 6:33 p.m.*)

Chair Klapperich read the resolution title into the record.

Mr. Alex Strawn provided a staff report:
- staff recommended approval of the resolution.

Commissioners questioned staff regarding:
- if the purpose of the modifications are just to meet federal changes or if there are substantial modifications;
- the number of legally constructed towers in the borough that are 200 feet or more;
- whether requiring the applicant demonstrate a need for requesting additional height on a tower [MSB 17.67.110(d)(2)] conflicts with federal code; and
- referred to 17.67.110(C) and questioned whether a replacement tower would be considered a new structure [17.67.90(A).

Chair Klapperich opened the public hearing.

The following people spoke in favor of Resolution 14-35: Mr. Murph O'Brien and Ms. Stephanie Nowers.

There being no one else to be heard, Chair Klapperich closed the public hearing and discussion moved to the Planning Commission.

MOTION: Commissioner Kendig moved to approve Resolution 14-35. The motion was seconded.

Commissioner Adams stated that he is in favor of Resolution 14-35, but would like to tighten up the language of 17.67.110(D)(2).

MOTION: Commissioner Adams moved a primary amendment to Resolution 14-35 by inserting the words "not to exceed 20 feet" to 17.67.110(D)(2) to read: "within a special use district, height increase under this section is limited to a cumulative increase of 10% of the existing facility unless the applicant demonstrates that the additional height, not to exceed 20 feet, is necessary for installation of one additional antenna array." The motion was seconded.

VOTE: The primary amendment passed without objection.

VOTE: The main motion passed without objection.

(*Commissioner Endle returned to the meeting at 7:04 p.m.*)

XI. CORRESPONDENCE AND INFORMATION

A. BOAA Case 14-01, Notice of Right to Appeal and Final Order (*Pertaining to PC Resolution 14-21, Sky Ranch Setback Variance, Staff: Alex Strawn - Continued from the December 15, 2014, meeting*)

Chair Klapperich read the agenda item into the record.

Mr. John Aschenbrenner, Deputy Borough Attorney:
- stated that this item is on the agenda for informational purposes only; and
- advised that this matter could potentially come back before the board.

Commissioner Adams:
- noted that there are two dates in the order that conflict;
- the opening paragraph references the Board of Adjustments and Appeals (BOAA) rendering an order on November 24, 2014;
- the last page above the signature references September 24, 2014;
- noted that regardless of which date was correct, the appeal period appears to have expired; and
- queried if an appeal has been filed.

Mr. Aschenbrenner:
- stated that he believes an amended order went out after this order;
- will get a copy for the commission and opined that it may answer Commissioner Adams' question; and
- because the appellant is not present, recommended that the commission take this information as it is currently presented.

XII. UNFINISHED BUSINESS

A. **Resolution 15-01**, a resolution adopting findings of fact and conclusions of law to support the Planning Commissions failure to approve Resolution 14-33. (*From the decision rendered at the December 15, 2014 meeting. Applicant: CMS, Staff: Susan Lee and Alex Strawn)*

(*Commissioner Kendig exited the meeting at 7:13 p.m.*)

Chair Klapperich:

- read the memorandum regarding quasi-judicial actions into the record;
- queried commissioners to determine if any of them have a financial interest in the proposed Conditional Use Permit (CUP);
- have had any ex parte contact with the applicant, members of the public, or interested parties in the proposed CUP; and
- if all commissioners are able to be impartial in a decision.

Commissioner Adams objected to the reading of the memo noting that the public hearing was closed on December 15, 2014.

Discussion ensued whether it is necessary to read the memorandum regarding quasi-judicial actions after the public hearing has been closed even if the decision is continued to another meeting date.

Mr. John Aschenbrenner:

- acknowledged that he is an advocate for staff in these matters;
- agreed that it is not necessary to read the memo regarding quasi-judicial actions after the public hearing has closed;
- referred to the letter that Mr. Glen Price sent to the Borough Clerk dated January 15, 2015; and
- stated that the applicant lodged an objection to a commissioner sitting, but only after the commission had made a decision in the matter.

[Clerk's note: the commission decided to disregard the questions presented in the memorandum regarding quasi-judicial actions since the public hearing had been closed on December 15, 2014.]

Discussion ensued whether the commission would accept information that is presented as handouts if it is provided after 12:00 noon on the Friday prior to a Planning Commission meeting.

[Clerk's note: the commission decided to disregard information that was received after 12:00 noon on the Friday prior to the Planning Commission meeting.]

Commissioner Healy:

- acknowledged that even if the commission disregards the questions presented in the memorandum regarding quasi-judicial actions at this time, they are not disregarding the rules that they represent;

- the questions were read at the onset of the public hearing and the commissioners sitting declared "no conflict";
- does not want anyone to get the impression that the commission is disregarding the issue of the conflict of interest rules; and
- stated that the commission respects the conflict of interest rules.

MOTION: Commissioner Endle moved to approve Resolution 15-01. The motion was seconded.

Commissioner Endle:

- stated that he didn't see everything that he wanted in Resolution 15-01, but opined that it presented a good starting template;
- noted that there was nothing in Resolution 15-01 that referenced back to Resolution 13-30 which denied the original application for a conditional use permit; and
- opined that there should be something in the resolution noting that there was a previous application that was denied.

MOTION: Commissioner Endle moved a primary amendment to Resolution 15-01 by adding Amendment E2 as presented on page 355 of the packet, and adding "previous application for the same" as the second whereas statement to read: "whereas, Resolution 13-30 contains findings of fact and conclusions of law which support denial of the pervious application for the same conditional use permit". The motion was seconded.

Commissioner Healy opined that the original conditional use permit was denied by the commission and, therefore, the current application is an entirely new application for a conditional use permit.

WITHDRAWN: Commissioner Endle moved to withdraw his primary amendment.

There was no objection noted.

Discussion ensued regarding the amendments proposed by Commissioners Endle, Adams, Rauchenstein, and Healy.

(The meeting recessed at 8:06 p.m., and reconvened at 8:14 p.m.)

MOTION: Commissioner Healy moved a primary amendment to Resolution 15-01, by:

- moving the "now therefore" statement before the first "whereas" statement on page 11 of 12 of the resolution;
- adding "makes the following conclusions" after " findings of fact and" and before "of law supporting denial";
- deleting "whereas" from the first and second "whereas" statements on page 11 of 12 of the resolution, and numbering them conclusions "1" and "2" respectfully;
- deleting "based on the above findings of fact and conclusions of law" from the new condition number "1";

- deleting "based on the above findings of fact" from the new condition number "2"; and
- moving the "whereas" statement from the bottom of page 2 to page 11, and renaming it as condition number "3".

The motion was seconded.

VOTE: The primary amendment passed with Commissioners Klapperich and Rauchenstein in opposition.

VOTE: The main motion passed with Commissioner Klapperich and Rauchenstein opposition.

(*Commissioner Kendig re-entered the meeting at 8:30 p.m.*)

XIII. NEW BUSINESS

(There was no new business.)

XIV. COMMISSION BUSINESS

A. Planning Commission Elections

1. Planning Commission Chair and Vice Chair

MOTION: Commissioner Kendig moved to nominate Commissioner Klapperich to be the Planning Commission Chair for 2015. The motion was seconded.

VOTE: The motion passed without objection.

MOTION: Commissioner Adams moved to nominate Commissioner Walden to be the Planning Commission Vice-Chair for 2015. The motion was seconded.

VOTE: The motion passed without objection.

2. School Site Selection Committee Representative 2

MOTION: Commissioner Adams moved to nominate Commissioner Kendig to be the Planning Commission Representative 2 on the School Site Selection Committee. The motion was seconded.

VOTE: The motion passed without objection.

B. Upcoming Planning Commission Agenda Items

Ms. Driscoll provided a brief update on projects that will be coming before the Planning Commission.

XV. DIRECTOR AND COMMISSIONER COMMENTS

Ms. Driscoll:

- spoke to comments made during audience participation regarding the proposed Meadow Lakes Special Use District (SpUD);
- the community requested the initiation of the SpUD process, and noted that staff merely facilitates the community driven process;
- stated that the next step after a community council adopts something is for it to go before the Planning Commission;
- SpUDs are based on the comprehensive plan;
- a 60-day public review period is wrapping up today;
- the Meadow Lakes community has been working on this process for eight years, but is free to request additional time to review;
- the community council has requested that the plan go back to them for discussion at their January 15, 2015, meeting; and
- the community will decide how they wish to proceed.

Commissioner Healy:

- congratulated Commissioner Klapperich for being elected chair once again;
- stated that he will be out of the country and absent from the January 19th and February 2nd meetings; and
- thanked staff and particularly Ms. Brodigan for all of the work put in over the last few meetings.

Commissioner Walden:

- thanked commissioners for the vote of confidence in once again electing him vice-chair; and
- stated that he may have to miss some meetings in the future and will keep Chair Klapperich and Ms. Brodigan informed.

Commissioner Kendig stated that this has been a very enlightening year and that he would not have missed it for the world.

Commissioner Adams:

- noted that there is nothing on the schedule for January 19th; and
- requested that all commissioners be sent a copy of the PC Policies and Procedures.

Ms. Brodigan acknowledged that there is nothing currently on the schedule for the January 19, 2015 meeting, and asked the commission if they would like to cancel.

Chair Klapperich:

- noted that the February 2nd meeting will be busy with two quasi-judicial public hearings and one legislative public hearing;
- acknowledged that the commission spends a lot of time attending meetings and reviewing packets;

- thanked the commissioners for their time, and for being courageous and not being afraid to take a stand; and
- suggested that the commission cancel the January 19, 2015, meeting.

There was no objection noted.

XVI. ADJOURNMENT

The regular meeting adjourned at 9:00 p.m.

JOHN KLAPPERICH, Planning Commission Chair

ATTEST:

MARY BRODIGAN, Planning Commission Clerk

MATANUSKA SUSITNA BOROUGH

PLANNING COMMISSION REGULAR MEETING (EXCERPT)

(RE CONDITIONAL USE PERMIT; RES. No. 14-33)

DECEMBER 1, 2014

CHAIR: Seeing and hearing none, one last call for any other audience participation. I close audience participation for the December 1st, 2014 planning commission meeting. Brings us up to Item No. 9, public hearing, quasi-judici -- excuse me, quasi-judicial matter. Commission members may not receive or engage -- excuse me, let me read the resolution title into the record first. Resolution 14-33, a resolution approving a conditional use permit in accordance with 17.60.030, permit required for the operation of an inert material monofill on Mat-Su Borough Parcels 17N02E18C010 and, final number, 17N02E19B006, applicant, CMS, and at this time, I'm going to read the conflict of interest *ex parte* question into the record.

A memorandum from Ms. Eileen Probasco, planning director, subject, planning commission quasi-judicial actions. In response to recent inquiries and in order to insure a fair decision on planning commission decisions, the following shall read -- be read by the chair after the resolution title. Before each quasi-judicial case is heard, based on Mat-Su Borough 15.08.150, conflict of interest, *ex parte* contact, three items. No. 1, I'm addressing this to the planning commissioners. Do you or any member of your immediate family have a substantial financial interest in any property affected by this decision or will you recognize a foreseeable profit as a result of this decision? Item 2, have you received or

otherwise engaged in *ex parte* contact with the applicant, other parties interested in the application or members of the public concerning the application or issues presented in this application either before the application or during any period of time the matter is submitted for decision outside of the public process provided by the Borough?

No. 3, are you able to be impartial in this decision? If anyone answers yes to Questions 1 or 2 or no to Question 3, both the borough staff and the applicant will be given the opportunity to ask further questions. Following this, the planning commission will render the decision as to whether or not the commissioner has a conflict of interest or can make an impartial decision. Commissioners? Mr. Bill Kendig -- that would be Mr. William Kendig from District 5.

COMM. KENDIG: The applicant -- the corporation, make the applicant, for the conditional use permit, I haven't done any business with them but they do have a sister corporation, if you will, that's -- buys recyclables that I have sold them in the past, similar to the same people that we gave the CUP to at 49th Street, the recycling. They're not -- never have been my main buyer but, on occasion, I have sold to them and I don't feel like I have a conflict or anything with it but I want to make sure that I put that out to everybody. I don't feel like I need to let them know.

CHAIR: For the record, that was Mr. William Kendig,

District 5. I would at this time like to ask the Borough if they have any questions for Mr. Kendig and then I will ask the applicant. Please state your name for the record.

MR. ASCHENBRENNER: John Aschenbrenner, deputy borough attorney. Excuse me, when Commissioner Kendig --

CHAIR: If you could speak a little louder, please, sir?

MR. ASCHENBRENNER: John Aschenbrenner, deputy borough attorney. Commissioner Kendig, could you please elaborate on the relationship between yourself and the -- what you described as the sister corporation to the applicant, what exactly the relationship was? I didn't quite understand that.

COMM. KENDIG: I in the past have sold scrap metal and my main buyer -- and they weren't my main buyer but, on occasion, they offered a higher price. I just wanted the higher price. Haven't done any business lately and, like I say, it was an occasional thing, similar to the CUP that was asked for at 49th Street, the recycling.

MR. ASCHENBRENNER: Can you tell me when the last time a transaction occurred?

COMM. KENDIG: Oh, early fall, late summer and, prior to that, probably hadn't been for four or five years.

MR. ASCHENBRENNER: Early fall of which year?

COMM. KENDIG: This year.

MR. ASCHENBRENNER: If you'll bear with me just one second? And this sister corporation, it's the corporation

that is involved with the recycling for the applicant?

COMM. KENDIG: Yes.

MR. ASCHENBRENNER: If I might bring to the attention of the board members, commissioners, under Mat-Su Borough Code 2.71.080, the recusal, it provides that a municipal official shall recuse himself from acting on a matter or proceeding coming before a borough elected body, board, commission or committee of which the official is a member when the matter or proceeding involves any person who is or has been a client of the official or the official's firm or partnership within the 12-month period immediately preceding the date of the action. I think this is -- I leave it to Mr. Kendig's and the Commission's decision but I think a fairly straightforward reading, the bright line rule that the Mat-Su Borough assembly has said is that if the applicant -- and in this case, basically, Mr. Kendig is saying it's an arm of the applicant, the recycling portion of this applicant, has been his client just within the last few months. So it looks -- it appears to me that there is a conflict so I -- and I urge the chair to allow the applicant the same opportunity that the Borough's had -- has had to inquire about --

COMM. KENDIG: And could I ask a question?

CHAIR: I thank you, Mr. Aschenbrenner. Mr. Bill -- William Kendig?

COMM. KENDIG: I -- and I have a question for Mr.

Aschenbrenner.

CHAIR: Please proceed.

COMM. KENDIG: Well, sir, this is very similar to the conditional use permit for the recycling on 49th Street, it just was never brought up at that. I'm just confused as to why it's being brought up now.

MR. ASCHENBRENNER: Through the chair to Commissioner Kendig, I can't speak to some past action and whether or not there was a conflict that perhaps wasn't brought forward. All's I can speak to is the facts that are brought before this commission this evening. It appears to me that you've laid out that the applicant's recycling arm for this conditional use permit has been your client just a couple months ago and so I'm reading Mat-Su Borough Code 2.71.080 which provides for recusing if you're an official where somebody coming before you is your client within 12 months is the bright line rule that the Mat-Su Borough Assembly has set.

CHAIR: Thank you, Mr. Aschenbrenner. Before I weigh in on this, I would like the applicant to have a -- an opportunity to address Mr. Kendig's disclosure. Please state your name for the record as loud and clearly as you can, sir.

MR. INGALDSON: Is that better? Bill Ingaldson. I'm an attorney on behalf of CMS. If I could just ask Mr. Kendig one question? If I understood it correctly, you sold some material to them?

COMM. KENDIG: Nate is who I dealt with.

MR. INGALDSON: But I mean you sold some recyclable material? They paid you some money for some recyclable material?

COMM. KENDIG: Yes.

MR. INGALDSON: And -- all right. Are these people that are -- you talked about this being a client but it sounds to me like this was maybe no different than if you went and sold tires from -- say to someone else or if someone goes to Target and buys things from there. This -- these aren't people that you're dealing with every day or that you're doing social affairs with or that it's a -- when they talk about being a client, is it just they paid more money? Right?

COMM. KENDIG: Yeah.

MR. INGALDSON: Okay.

COMM. KENDIG: Yeah, it's not -- like I said, the last time I'd done any business with them was probably four years prior.

MR. INGALDSON: Thank you. And, Mr. Chairman, I guess my point on this is just that if you -- the fact that someone happens to sell something in an arm's length transaction which it sounds like this is and doesn't have an ongoing regular business doesn't make that person a client and I don't think that the borough code was intended to be -- to address that issue. I think the borough code is intended to address an

issue where you have an ongoing regular relationship. That's what a client is.

CHAIR: Thank you, Mr. Ingaldson. The most important question to me is are you able to be impartial in this decision? And I ask you, Mr. Kendig.

COMM. KENDIG: I feel I could be impartial to it. I've spent hours on hours going through our material and I think I feel confident in saying that I can be impartial.

CHAIR: Before I ask the question to my fellow commissioners, I feel the weight should be on the amount of business and it seems like it's an insignificant, one-time transaction out of the last five years that doesn't portray a -- an engaged relationship as of tonight or in the future so I ask my fellow commissioners. Yes, Mr. Aschenbrenner?

MR. ASCHENBRENNER: For the record, if I might just address the Board one more time, John Aschenbrenner, deputy borough attorney. The code doesn't have a provision in it for trying to surmise the scope of the client relationship. It just isn't there. So the Mat-Su Borough Assembly has set a bright light rule that no commissioner is supposed to sit when a client of that official, they have interacted with them within the preceding 12 months. So while I understand the applicant's argument with regard to this, that's just not the code. You could get into those other kinds of questions which would be the backdrop of whether or not due process and a fair

hearing is afforded and whether or not the commissioner can afford the applicant a fair and unbiased decision maker but before you even get there, you have a Mat-Su Borough code provision that provides a bright line rule. So, again, I urge the Commission to follow the borough code and lodge an objection for the reason that it's pretty clear that Mat-Su Borough Code 2.71.080 applies in this case so that there's not an error built into the record on this appeal.

CHAIR: I thank you for that clarity and my question would be on the first question do you or any member of your immediately family have a substantial financial interest, recognize a foreseeable profit in past, there has been insignificant small transactions that were waived because of this -- because of the miniscule relationship. Isn't there a level of -- like I say, why did -- why does the -- we talk about substantial financial or recognize a foreseeable profit. It seems to put a level on what type of and how much business. If it's very small and insignificant, I would like to have experts enjoined in this decision process we're doing.

MR. ASCHENBRENNER: Just respond one more time. John Aschenbrenner, deputy borough attorney. There's a separate ethics provision that deals with substantial financial interest that -- the provision I'm pointing to is totally separate. So you're absolutely right and the provision that you're relying upon also would disqualify a commission member

from sitting if they had a substantial financial interest in the matter and then the Mat-Su Borough Assembly has gone on to define that in monetary terms as over a thousand dollars, I believe, but we're not dealing with that provision. That's a separate provision. The -- and rather than having the planning commission chair go through at the beginning of these types of hearings every potential conflict of interest or recusal requirement of the ethics code, the program that's been provided for the chair tries to hit the bright line rule of a substantial financial interest but that's not the provision that applies here. The most specific provision would apply -- and in this case, it's pretty clear to me that that provision would be -- that Mr. Kendig has said and laid out that the applicant has been his client just three months ago. So, again, I urge the Board to not build an error into the record on this conditional use permit application.

CHAIR: Thank you, Mr. Aschenbrenner. Before I go to the planning commissioners, I will go back to the applicant to address what we've heard.

COMMISSIONER: Okay. We're talking a bright line interpretation? I believe the code says the applicant, if he did business with the applicant. He did not do business with the applicant, he did business with a separate, independent corporation. They are not wholly owned, they are not subsidiaries. So if we're going to state the bright line

rule, you have to take the bright line rule the whole way and Mr. Kendig did not say he sold anything to Central Monofill Services. It was the applicant.

MR. ASCHENBRENNER: I don't know if that was directed at me. I'm the deputy borough attorney.

COMMISSIONER: Well, you're the one --

MR. ASCHENBRENNER: The commission's up here so --

MR. JACQUES: Oh, I understand. Okay.

COMMISSIONER: I'm sorry, sir.

CHAIR: Thank you. Would you read -- did you state your name for the record?

MR. JACQUES: I'm sorry, I'm Stuart Jacques. I'm the president of Central Monofill Services.

CHAIR: Stuart Jacques.

MR. JACQUES: That's correct.

CHAIR: Thank you, Mr. Stuart. Would -- Mr. Jacques. Would you please remain that and get -- I wanted to ask for clarity from Mr. Kendig. Then did you do business with the applicant?

MR. JACQUES: No.

CHAIR: Mr. Aschenbrener, were you under the interpretation he did business directly with the applicant?

MR. ASCHENBRENNER: It's my understanding that this is an application for a C&D monofill and recycling center and that the entity that he was going to -- referring to would be doing

business at this site. If I'm in error, you know, I leave it to the Commission to sort that out.

COMM. KENDIG: No, two separate but I just want it to be perfectly clear because it is a separate corporation but some of the same people may be involve in these different corporations but I have not done any business at all with Central Monofill.

CHAIR: Thank you. Would either the Borough or the applicant have further questions for this commission before I ask the Commission? Seeing and hearing none, all right.

MR. ASCHENBRENNER: Do we have discussion? Oh.

CHAIR: Mr. Aschenbrenner?

MR. ASCHENBRENNER: If we could just have a moment, I believe in the record, there's an e-mail that explains the relationship between the corporations. So if we could just have a moment?

CHAIR: Approved.

MR. INGALDSON: Mr. Chairman, while we're waiting, if I could make one brief comment? Bill Ingaldson again and I think the important issue here too that seems to be overlooked is the term client. We're talking about this being a bright line but a client is different than someone that just happens to make an occasional sale. A client implies a fiduciary relationship between the parties which is not this -- the case here. So if you happen to sell something, if you sell someone

your car, they don't become a client and so I think that that's where Mr. Aschenbrenner, I respectfully disagree with his interpretation.

CHAIR: Thank you, sir. I just want to remind my commissioners to make certain we turn off our red buttons when we're not speaking and we'll see where that little bit of that feedback is coming from so that not only is it not annoying, it's pleasant to the audience that you hear every word and don't hear what you don't want to hear but you hear what is needed to be said.

MR. ASCHENBRENNER: Mr. Chair?

CHAIR: Yes.

MR. ASCHENBRENNER: John Aschenbrenner. Looking at page 2138 of the record, it provides a clarification from the applicant that Central Recycling Services owns and operates the recycling facilities and holds the operations contract with CMS to run the monofills. So -- and, again, getting back to this question of -- that the applicant has raised with regard to whether or not selling to the rec -- CRS makes them a client. Mr. Kendig, can you further elaborate on what business are you in?

COMM. KENDIG: Recycling.

MR. ASCHENBRENNER: And then you sell to CRS?

COMM. KENDIG: Yes.

MR. ASCHENBRENNER: Oh, so I just want to note for the

record it's clear from the record --

COMM. KENDIG: Central Metal Environ -- Central Environmental I sold to.

MR. ASCHENBRENNER: Okay. So I guess the question is is that -- it sounded earlier like that was CRS. Is that different than CRS?

COMM. KENDIG: I believe so. Central Environmental, Incorporated, is different than CRS, yes.

MR. ASCHENBRENNER: Oh, this is this demolition and abatement company and it's a customer of CRS is what the record provides. Perhaps the chair would like to inquire of the applicant --

COMM. KENDIG: So I -- if I could, I am looking at the e-mail and the bottom line says Central Environmental, Inc. -- that's who I sold to -- is the demolition and abatement company and is a customer of CRS. So I sold to a customer of CRS.

MR. ASCHENBRENNER: Right, and then the final line says separate companies, same owners.

COMM. KENDIG: Yeah, I understand that but corporations aren't individuals.

MR. ASCHENBRENNER: I leave it to the Commission. I am concerned that it may be building error into the record and I leave it to the Commission.

CHAIR: For those that are still arriving, I'm not going

to repeat what business has been done but I know that there's been several that have just arrived after I'm reading the *ex parte* communication and Mr. Kendig revealed that he'd done one piece of business in the last five years with some association with the applicant so we're just trying to sort that out whether Mr. Kendig is able to have an impartial decision and he said yes.

We've heard from the Borough last. Do we need any other information from the applicant? Any additional information from the Borough? I believe that brings the decision to the planning commission. We've heard attorney Aschenbrenner, we've heard Mr. Kendig and we've heard from the applicant. As chair, the more prepared people hearing all the information usually renders a better decision so I would like to have as many planning commissioners as eligible hearing all this information but we have one, two, three, four, five commissioners here. Mr. Bruce Walden is District 4 en route from Anchorage. Mr. Adams has been recused so it does take four commissioners to pass legislation and it would take four -- am I right, Ms. Brodigan, if I were to take a vote on allowing Mr. Kendig, would it be four or would it be a majority? Would it be three?

MS. BRODIGAN: The planning commission requires four affirmative votes to take action. You do have four individuals here that can vote so you can continue.

CHAIR: But I -- I'm going to ask the commissioner since we've heard Mr. Kendig that would like to participate and feels he can be impartial if I was to vote without Mr. Kendig, I want to make certain I'm on the record how many votes would it take to allow Mr. Kendig to participate, three or four, and would Mr. Kendig be allowed to vote?

MS. BRODIGAN: It would take three votes from the other commissioners to agree to allow Mr. Kendig to remain.

CHAIR: Commissioners, you've heard attorney Aschenbrenner clearly advising that this would be a cautious area. Mr. Endle?

MR. ENDLE: Just for clarification, is it the Commission's responsibility to approve this or is it the individual's responsibility to -- yeah, who has the authority here?

CHAIR: Well, I had to ask the question if he could be impartial in his decision and Mr. Kendig said yes. That satisfies me. You've heard Mr. Aschenbrenner and you've heard the applicant so now I would be asking the rest of the commissioners if you feel that the information that you've been given and is on record on public, do you want to allow Mr. Kendig to participate or ask him to leave?

MR. ENDLE: Well, I can answer that but my question is -- to staff, perhaps to the chair --

MS. BRODIGAN: Mr. Chair, borough staff and the

attorney's office has indicated that they feel that there is a conflict. It -- the final decision is up to the Commission. Mr. Kendig feels that he can be -- that he would not have a conflict but the final decision is up to the Commission.

CHAIR: So I'm very respectful of everybody's time and standing and I just want it to be right. You're telling us it's up to the Commission, it's not up to the borough attorney. He's made recommendations that we should definitely adhere to. The borough attorney is certainly someone that this planning commission should take.

MS. BRODIGAN: Mr. Chair?

CHAIR: Yes.

MS. BRODIGAN: The borough attorney has stated that by allowing Mr. Kendig to remain, there could be -- I have to go back and see what he said. It could build an error into the record.

CHAIR: I appreciate that. That's on the record but I want to make certain that we, as five commissioners, have the right to approve or disapprove. Well, any other further discussion? Mr. Thomas Healy?

COMM. HEALY: Well, I wasn't expecting to adjudicate something like this. I -- it seems to me -- I mean, there is -- the attorney has pointed out a bright line which seem on the surface to indicate that Mr. Kendig should recuse himself. On the other hand, there's information in terms of the -- Mr.

Kendig had some business with the firm that is not the applicant. However, the -- it has been pointed out that Central Environmental which is not the applicant which -- with whom Mr. Kendig had a transaction gets -- it's a separate company. They're not the applicant or, really, the same owners. I -- I'm not a corporate attorney so I can't tell if they're so intertwined that they are, essentially, the applicant. I just can't -- that's beyond me to determine that. I think it would be beneficial to have as many commissioners hear this issue as possible. I don't take lightly the borough attorney's statement that he believes this may build an error into the record so I'm kind of torn here. I think the cautious thing to do in the big picture would be to have Mr. Kendig recuse himself. However, I don't think that serves the broader public interest of having as many commissioners hear this as possible.

CHAIR: Ms. Brodigan?

MS. BRODIGAN: Mr. Chair, just as a reminder, it does take four positive votes to take action including allowing Mr. Kendig to remain so the vote -- the Commission will need to vote to either keep him in the -- in that public hearing or him to recuse himself.

CHAIR: Thank you very much and, ladies and gentlemen -- and I appreciate your patience but, clearly, what's going to be decided tonight or possibly postponed but I'm saying this

is something that will have long-lasting effects after a couple of hours so we just want to make certain that it's done right when it's done and so excuse me if I belabor this a little bit but I do have a question for Ms. Brodigan since Bruce Walden from -- is being delayed from District 4 and since this is quasi-judicial and all commissioners need to have the same information, if we were to prove -- move forward with the public hearing in just a minute, it would not be information he would get here. So if he arrives here in a few minutes and doesn't have all the information, would he have to recuse himself from tonight so it'd be just us five?

MS. BRODIGAN: The information that will be provided tonight is also included in the packet and Mr. Walden did pick up his packet last Tuesday morning. Actually, he had someone pick it up for him.

CHAIR: So if the additional commissioner arrives shortly and we do get through all our public hearing and we get to a vote tonight, he would be able to participate no matter when he arrived?

MR. ASCHENBRENNER: Mr. Chairman?

CHAIR: Yes.

MR. ASCHENBRENNER: John Aschenbrenner. May I address the Commission on behalf --

CHAIR: Please.

MR. ASCHENBRENNER: I'm here on behalf of staff as an

advocate and you could certainly ask the applicant the same question. It'd be my understanding that Mr. Walden or any commission member would be able to participate even if they were absent from a portion of the hearings as long as they review the record and come up to speed on it. So if Mr. Walden missed some of the public testimony, in order for him to participate, we would be urging that the Commission take a recess and allow him to listen to that information. Thank you.

CHAIR: Thank you. Is there any other further discussion? Mr. Healy, I'm going to ask you to turn that little red mike off there. It just seems to help.

COMM. HEALY: Oh, I'm sorry.

CHAIR: That's fine. Is there any other discussion -- your microphone too, please, Mr. Endle?

MR. ENDLE: I'm sorry.

CHAIR: It just seems to help for clarity in the house. Is there any other discussion by the Commission before what I believe is my right and my duty to ask for a vote with all the testimony we've heard from the applicant, the attorney and Commissioner Kendig to vote whether we would allow him to participate in the decision making process tonight? Mr. Healy.

COMM. HEALY: Thank you, Mr. Chair. If I may, could I -- I'm stuck on this issue of three corporations, same owners.

Could -- through the chair, could I ask the deputy borough attorney as well as the applicant's representatives how they would interpret that question; that is, there's Central Monofill Services which is the applicant. There's Central Recycling Services and Central Environmental, Inc. The question would be if Mr. Kendig did business with Central Environmental, does that constitute doing business with the applicant?

CHAIR: Proceed.

MR. ASCHENBRENNER: John Aschenbrenner, deputy borough attorney. It's an interesting question. What we're trying to sort out is whether or not under the borough code a commissioner should recuse themselves. Basically, under 2.71.080, the Mat-Su Borough Assembly has set a bright line rule in the sense of 12 months that a commissioner or other board or commission member should not sit on an action where they've had transactions with the applicant or the entity that's appearing before that body. The question here is okay, so you have several corporations all engaged in recycling which are applying for a C&D monofill cell and recycling center and it's admitted in the record that they are the same owners but there are several different corporations. In my opinion, you know, it's easy to say they're separate corporations but that's a -- that's something you do to create the corporation. What they've essentially admitted in the

record is they're the same owners of all of these entities. They may be creating separate corporations for a variety of reasons but, ultimately, you have to ask the question would the assembly in carrying out 2.71.080 want a commission member to sit who has engaged in transactions with one of the corporations that the applicant is saying is integrally involved with this operation. Now, they're saying well, no, wait a minute, the corporation, CRS, is the operator and Central Monofill Services will hold the permits so Central Environmental shouldn't count. So to me, I think that what the assembly was trying to do was make sure that you have neutral decision makers that haven't had recent within the last 12 months interaction with the folks that are coming before the body. So it looks awful close to me, especially when, you know, it's admitted that they're all the same folks that own these different corporations.

So what I'm saying is if we go forward and Mr. Kendig sits, then you have the potential of -- whether the appellant is a member of the community or the Borough or the applicant, you have built into the record the potential that Mr. Kendig, by sitting, violated 2.71.080 and can build an error into the decision itself. In my opinion, it looks a little too close for comfort. I would feel better if -- and I'm an advocate here on behalf of staff and staff's recommended approval -- if we didn't have built into the record that one of the

commissioner members was transacting business with the applicant just three months -- just a couple months -- you were talking September, I believe you said -- before we were before the Commission. So, you know, I believe it to the Commission but I think what you're doing is just building an error into the record that's unnecessary. You still have a quorum, hopefully, of folks that don't have any conflicts of interest but why we would build into a decision a potential error right at the get-go, I'm at a loss but I'll leave it to the Commission.

CHAIR: Thank you. It's clearly read into the record, sir. Mr. Brian Endle, District 1.

MR. ENDLE: Just want to weigh in a little bit on this. I do believe Mr. Kendig and that he can make a partial decision. However, reflecting on what the attorney said there and my understanding of corporations, et cetera, this -- I'm siding with the attorney on this in respect because if this goes further and it was to be repealed in any way, whether it went down or it went up, it does put a cloud on the decision.

CHAIR: Mr. Thomas Healy.

COMM. HEALY: Mr. Chair, could you recognize the representatives of the applicant? I asked and I get responses to my question from both the Borough and the applicant?

CHAIR: Could you repeat your question clearly and succinctly to the applicant?

COMM. HEALY: My question was -- my question had to do with the three firms all of one owner and whether Mr. Kendig's actions with Central Environmental, I guess, constituted under its corporate structure transactions with the applicant. I guess that's generally my question. Is that -- you understand that? Thank you.

MR. INGALDSON: Bill Ingaldson on behalf of the applicants. Let me start off by saying I have been intimately involved in this exact issue of corporations and their separate identity. I was one of the attorneys in the *Brown v. Knowles* Alaska Supreme Court decision that just came down last year that dealt with piercing the corporate veil. The bottom line is that there hasn't been a corporate veil pierced here and whether it's a parent, subsidiary or it's a -- separate companies, it doesn't matter how they're owned as long as they're operated independently and have not been formed for the purpose of defeating public convenience or fraud. So they are separate entities and they're no more -- it'd be no more than saying well, you all have the same parent and I did business with someone's parent and their three brothers that maybe have business and so if you are, I agree with Mr. Jacques, if you're talking about a bright line test, I think he's correct.

More significantly here is let's now put form over function. What's causing me a little bit of concern here is

that the borough attorney is -- now it's going from being a client to tran -- doing transactions. I don't have the code in front of me but when he read the code, he didn't say have you done any transactions with the party, he said are you a client and that is a huge, huge difference because a client -- a client infers that there's a fiduciary relationship between the parties, not a one-time sale thing because that means that you have something to gain by gaining favor with them or some obligation, ongoing obligation, to them. There is -- what I heard Mr. Kendig say, there's no ongoing obligation to sell things, no ongoing deals that he's going to get some benefit from this. He made a one-time sale. So I respectfully disagree with Mr. Aschenbrenner.

Finally, this issue of are we building error into the record, we're already missing one commissioner, Commissioner Walden and, obviously, from the applicant's standpoint, the more commissioners, the better because it's not a majority. They need four people to prevail. If it turns out that the vote is five in favor and none against, it'll be a moot point. If the vote is down and the Commission decides you're not going to award it, it's a moot point because no one is saying that that transacti -- unless there's some issue that that transaction somehow disposes him against because I guess that could happen too but right now, we're really concerned because we -- we're already down two commissioners.

MR. JACQUES: And I probably shouldn't say anything but it does frustrate me a little bit, sir, that, based on the attorney's -- the borough attorney's interpretation of that code, he keeps again going to this bright line of this sale. If I owned a coffee shop here in town and was coming for a CUP and I sold each of you a cup of coffee, would now all of you have to recuse yourself because there was a transaction?

CHAIR: Again, I appreciate --

MR. JACQUES: It gets to the point of, you know --

CHAIR: I appreciate the comments being held by the audience but I -- it does trigger a question to Mr. Aschenbrenner from me, the chair. Isn't there a threshold of doing business? Is there -- I mean, I applaud Mr. Kendig because I don't think it was even significant. I mean, a wheelbarrow full of too old wheels versus a massive transaction, is there -- isn't there something so insignificant that it doesn't really apply as a -- as an ongoing client relationship?

MR. ASCHENBRENNER: John Aschenbrenner, deputy borough attorney. The applicant is correct, it doesn't refer to transaction in 2.71.080. The strict language is -- or the language of the code is a municipal official shall recuse himself from acting on any matter or proceeding coming before a borough-elected body or commission or committee of which the official is a member when the matter or proceeding involves

any person who is or has been a client of the official or the official's firm or partnership within the 12-month period immediately preceding the date of the action. So the applicant is correct that the analysis is are they a client. What I heard Mr. Kendig say was he's done business with them in the past and he did business a couple months ago. So, again, I'll leave it to the Commission. I think the relationship has been laid out. Commission has the code and, again, I understand the applicant's concern about the number of officials. I -- my -- as an advocate on behalf of staff, I want to ensure that those officials acting on the matter don't have a conflict or in this case a requirement to recuse themselves that is building, potentially, an error into the record that's unnecessary.

CHAIR: Thank you, Mr. Aschenbrenner. I think we have enough information. We've been at this an hour. We don't want to rush it. We want to get it right. As chair, is a one-time transaction that I would assume minimal dollars constitute recusal? We want it right. We want it right for the public most of all. Does five people make a better option than four or six? I think more people hearing more information makes sense. Mr. Rauchenstein, District 7, you've been quiet on this. Do you have any comment?

COMM. RAUCHENSTEIN: I do business with the Mat-Su Borough. If I would -- couldn't -- if I couldn't act

independently, I will have no business being up here. So --

CHAIR: Obviously, we want this right for a duration, for decades, for generations. Do I want to cause a problem? No, I want it right. I think there's a little -- we've all heard the information. We do need to move on. I don't think there's any more information. The Borough spoke last. Any closing comments from the applicant before I ask for a vote from the -- seeing none, the Borough has been asked, the applicant's been asked. I believe it is the authority of this planning commission to exercise its right to vote whether we allow Mr. Kendig with his voluntary disclosure of the transaction he made with a real -- a corporation that knows the corporation. So we certainly want -- we want it right but I guess it would be time for us to call for the vote.

For the record, obviously, Mr. Kendig has stated that he can. Is he allowed to be a member in this voting, Ms. Brodigan?

MS. BRODIGAN: Mr. Chair, that's a very good question.

CHAIR: Well, obviously, he's a commissioner.

MS. BRODIGAN: The question is whether he remain. He has already stated his decision. I believe it would be up to the rest of the Board to decide whether he should remain or not.

CHAIR: Well, let me ask this first, is there any objection to the planning commission to allowing Mr. Kendig to participate in this discussion? We have an objection. So we

have an objection so, clearly, there would be one vote against allowing Mr. Kendig. So I think it's important for us to -- somebody, either the clerk or the attorney, does Mr. Kendig be allowed to vote on this.

MR. ASCHENBRENNER: John Aschenbrenner, deputy borough attorney. No, I don't believe it's appropriate for commission members to vote. Once he's decided not to recuse himself, then I don't believe it would be appropriate for him to vote on -- and I'm here on behalf of staff as an advocate and, certainly, you can ask that question.

CHAIR: It's been clear from the attorney representing the Mat-Su Borough that Mr. Kendig cannot vote. Any further comment from the applicant?

MR. JACQUES: I'm just not familiar with that part of Robert's Rules of Orders to answer that but I -- you know, Mr. Aschenbrenner's saying he does not think it's appropriate but he hasn't cited any rule disallowing it and I'm not sure that if someone moved to have him recuse himself, if he doesn't feel he can vote, I'm not sure that it passes to this.

MS. BRODIGAN: Mr. Chair?

CHAIR: Thank you.

MS. BRODIGAN: Mr. Kendig brought this before the Commission to let them know that there had been contact within three months. He's already stated his facts. Now it's up to the Commission to determine whether or not he can stay. He

has stated that he does not wish to recuse himself so it is up to the remaining commissioners to determine whether or not he can remain. It takes four positive votes.

COMM. KENDIG: So can I ask a question?

CHAIR: Proceed, Mr. Kendig.

COMM. KENDIG: Do you know that for a fact or are you just guessing that?

MS. BRODIGAN: Mr. Kendig, we do have the borough clerk in the office and she has confirmed that that is accurate.

CHAIR: Well, clearly, with Mr. Walden and Mr. Adams out, it's a moot point because we can't have -- we can have a majority if all three -- if the remaining three vote yes. It fails?

MS. BRODIGAN: No, sir, it would fail because the planning commission requires four positive votes to take action.

MR. INGALDSON: May we be heard?

CHAIR: You may be heard.

MR. INGALDSON: This is Bill Ingaldson on behalf of the applicant. The planning commission requires four votes to take action on a conditional use permit or other type of proposal. I don't think that the rules require a vote of four people to make procedural decisions.

MS. BRODIGAN: I'm sorry, sir, but in this case, it does.

MR. INGALDSON: Is there a section in the code that

you're relying on?

MS. BRODIGAN: We are a small commission so we do run by Robert's Rules but in this case, we run -- we also have to follow the rules of the planning commission. It states in policies and procedures that for the planning commission to take action, it requires four votes, four positive votes. I'd be happy to show you that on a -- in a break.

CHAIR: Well, clearly, we want -- we wanted this to go right so that there's no problems going forward and part of me says that we're now instilling an opportunity that Mr. Aschenbrenner wanted to stay away from. Are you totally convinced, Mr. Aschenbrenner, that a majority of these commissioners cannot vote Mr. Kendig in?

MR. ASCHENBRENNER: I believe the clerk is correct that it's four votes for the planning commission to take action but it really boils down to how you frame the question and I believe under Robert's Rules, it should be framed in the positive whereas if you make the motion to have Mr. Kendig recuse himself and it doesn't garner four votes, then if it fails, it's a motion in the positive. If you make a motion to allow him to stay, then if you frame it that way -- and the clerk or the Borough could correct me if I'm wrong -- I think that's a motion in the negative and then you would be left with the quandary of what happened if it didn't garner a majority vote. So I think the way to frame the question -- I

could be wrong from the clerk for the planning commission and the Borough -- would be a motion for Mr. Kendig to recuse himself and if it didn't garner four votes, then he could remain. Does that make sense?

CHAIR: Well, I'm not certain that this is clear and we've taken an hour and 10 minutes on this and I would like to take a five-minute break for the clerk and maybe the borough clerk or maybe us to get total, make us absolutely certain because we want both sides to have the equal opportunity to be right on this and if we make an error on this, the next four hours or the next four weeks could be in jeopardy. So please bear with me and we're going to ask for a five-minute at ease at the clerk's request.

(Off record)

CHAIR: December 1st meeting is back in order. I asked for a five-minute at ease and it was seven minutes. I believe everybody was here when we took the at ease to get clarification. The most important thing for this planning commission is to get it right, to do the public's business. We have the borough bu -- we have a borough and we have an applicant and then we have the public's interest at hand here and if we don't start out with the foundation that makes sense that -- how can we build anything above it or extend into the future for years and generations?

The question has been, obviously, Mr. Kendig's voluntary

reference to a one-time piece of business with a corporation that is related to the corporation of the applicant and we've heard from Aschenbrenner, we've heard from the applicant, we've heard from Mr. Aschenbrenner, we heard from the applicant and we've heard from our clerk and we've heard from the assembly clerk and a couple of things that are important is this planning commission and the historical record and in formality, it takes four affirmative votes yes to vote any action and the historical record is something that I'm going to, as chair, adhere to. So it takes four affirmative votes to allow Mr. Kendig to participate in this op -- in this discussion and we have the challenge of one delayed on the weather and one delayed for another reason so we only have five planning commissioners. It's been ruled by the clerk that Mr. Kendig cannot vote. It takes us to four remaining. So it would take a unanimous yes to allow Mr. Kendig to participate and we've heard both sides and I need to be succinct and give one opportunity to each but we need to move forward. Mr. Aschenbrenner.

MR. ASCHENBRENNER: Mr. Chair, John Aschenbrenner, deputy borough attorney. I concur that it takes four votes but I would ask the clerk if the motion is framed in the positive and to check with the -- if the borough clerk is still here, I would have understood the motion to be a motion to remove Mr. Kendig or ask him -- motion to have him recuse himself. Then

if it failed to garner a majority -- I guess you'd need four votes -- then no action would be taken and he'd still be sitting.

MS. BRODIGAN: Mr. Aschenbrenner, through the chair, the question will be whether the Commission approves Mr. Kendig to remain on the Board for this issue.

CHAIR: The applicant would like to respond.

MR. INGALDSON: Thank you. Bill Ingaldson on behalf of the applicant. Through the chair, Mr. Kendig has a right to participate if he does not recuse himself. If the Commission is going to take action, it's to prevent him from participating. He does not need approval to participate. So there would have to be a motion to recuse him which would then have to pass by the vote because every one of you has the right by your election on the planning commission to participate unless there's a motion to recuse if a commissioner has not recused himself. So it would be wholly improper to frame the question does he have a right -- do we approve him continuing because you could say that about every single member. The question has to be someone has to move for him to be recused. It has to be seconded and then you vote. That is taking the action. Otherwise you don't need to take action and you would not be taking action. He does not need approval.

MS. BRODIGAN: Mr. Chair?

CHAIR: That's on the record. Ms. Brodigan?

MS. BRODIGAN: May I respond, please?

CHAIR: Please.

MS. BRODIGAN: Commissioners are advi -- are directed to bring any potential conflicts before the Commission. They are asked if they think that they have a conflict or not. They have the opportunity to say that yes, they have a conflict and request to be recused or they can say that, no, they do not think that they have a conflict. It is up to the remaining commission to determine if they do -- or if there is an appearance that there is a conflict. Mr. Kendig -- it is up to the Commission to decide if Mr. Kendig will remain.

MR. INGALDSON: And Mr. Aschenbrenner and I are -- concur on this and, just so you, at least from the attorney for the applicant and the attorney for the Borough, our legal law says that it has to be a motion to recuse.

CHAIR: That's on the record. It's been conferred with the assembly clerk and the planning commission clerk that the can be posed. It would take a yes vote, do you approve of Mr. Kendig remaining in the discussion and it would take four yes votes to allow him to remain here. Mr. Healy?

COMM. HEALY: Just to clarify, it seemed to me the Commission was asked this question before the break and there was objection to the question, correct?

CHAIR: Correct.

COMM. HEALY: There was no motion made but there was a question put to the -- okay. So we need to make a motion, as you just stated and as the clerk stated and then we need to vote on that motion, correct? If that's the case, I would make that motion.

CHAIR: State that motion for the record.

COMM. HEALY: Whether to approve of Commissioner Kendig -- whether he will remain on the -- to hear this decision. I mean, that's --

CHAIR: Resolution 14-33.

COMM. HEALY: Yes.

CHAIR: There's a motion been made to allow Mr. Kendig to remain in the discussion Resolution 14-33. Do I have a second? There's a motion been made to allow Mr. Kendig to remain by Mr. Thomas Healy. I would second that motion. Is there an objection? Brian Endle objects. There's been a motion made to allow Mr. Kendig to remain in discussion and it's been seconded and there's an objection so I call for the vote and it takes four affirmative votes to pass any action and Mr. Kendig cannot vote, according to Mr. Aschenbrenner and the clerk.

Are you ready for the vote? A yes vote allows Mr. Kendig to remain. A no requires him to leave for the duration even if this meeting's extended and public audience participation is extended. Again, a yes vote allows Mr. Kendig to remain.

MS. BRODIGAN: The motion to allow Commissioner Kendig to remain in the public hearing failed with Commissioner Endle in opposition.

COMM. KENDIG: Okay. I'd like to say something before I leave this meeting.

CHAIR: May I ask the Commission if there is any objection to allowing Mr. Kendig to have closing comments? Seeing and hearing none, proceed.

COMM. KENDIG: You know, sitting on this planning commission's a voluntary job. There's not a lot involved in it. This was a very complex issue that was spent a lot of time on. While most people sitting in this room were having a Thanksgiving weekend with their family, I was not and I just feel like that's -- I have a solution. When we do a consent agenda, that's when we should say do we have a conflict because if it had done -- been done that way, I wouldn't have -- I would have been spending my Thanksgiving weekend with my family. Right now I just feel like that was taken for granted. Don't appreciate it. Hope it doesn't happen again because you won't have to worry about me being in any decisions and it does.

CHAIR: Thank you, Mr. Kendig. I believe it'd be appropriate to -- you know, there's parliamentary procedures and then there's also common sense and we all would like to somehow get this resolved that makes sense and I believe the

most important thing for the -- tonight is to move into the public hearing as quickly as possible so that we can hear from everyone that's here tonight and I believe it would be in the best interest of the applicant and the Borough and the public to have two additional planning commissioners here before the final decision is rendered because if they can bring themselves up to speed and we will have six planning commissioners that are very experts and very prepared so if we hear as much audience participation as we can and then we may have to extend the audience participation to time certain, bring my other two planning commissioners up to speed and then we would have six planning commissioners to render a decision and, as a rule, if you have six intelligent, experienced, passionate people about learning the facts, chances of rendering a proper decision would be better than just five or four. Yes?

MS. BRODIGAN: Mr. Chair, just for a point of clarification, so are you suggesting that we open the public hearing and allow those people here tonight to speak and then possibly continue that public hearing to another meeting and, as discussed earlier, then two planning commissioners who are not here would still be able to participate in that discussion, that decision making via either listening to audio provided through various means, being able to read testimony and things like that and be able to participate so there would

be a larger body for that decision.

CHAIR: Exactly but, clearly, the public's been here an hour and a half and we know we have weather and we know we have lots of data to go through. Ordinarily at this time, I would ask Susan Lee and Alex Strawn to write a staff report and then the application -- or the represent -- provide an overview of the application and I was going to ask my fellow commissioners to waive the -- you know, the applicant's time frame so that we get all the information out. So, just to make certain that I'm following procedures, if we do have to extend or we choose to extend in the personal interest of the public the public hearing, would we have an additional presentation by the Borough and the applicant at the extended public hearing?

MS. BRODIGAN: Normally you wouldn't because you're just continuing the action that's already been started. So, as part of this issue being opened up at today's meeting, you would have the presentations by the two entities and then the public speaks and, basically, what the planning commission is saying by continuing the public hearing is saying we know that there is more discussion about this, we want to keep the discussion open and you would continue that at the next public hearing but you wouldn't necessarily kind of rehash the whole thing over again. If somebody wanted the information that was part of this meeting, they could either attend or get that

through the minutes or audio, a variety of different means.

Yes, normally there's no new introduction of information but the public hearing, the public participation portion continues.

CHAIR: Well, I appreciate the patience. I have children and moms and dads and lots of things going on in people's lives. How do I move as -- quickly enough to satisfy everyone and yet not rush this? So I believe the proper protocol would be the -- at this time, Susan Lee and Alex Strawn would provide the staff report for their recommendation approving this conditional use permit. If there's no objection, I'd like to ask the Borough to proceed after Mr. Engle. I would -- Ingaldson. Bill Ingaldson representing the applicant. Sorry, sir. Please proceed.

MR. INGALDSON: Mr. Chair, given what's transpired tonight, in order that everyone have a chance at a fair hearing and we don't have people complaining later that there are (indiscernible) commissioners that aren't here, we would request that this hearing be put off. I think the Commission's made -- I -- and, with all due respect, if we could have a little courtesy from people here, we were here waiting too and have been waiting, as everyone has. I think the Borough's already made -- I think the Commission's made a mistake, with all due respect, in how Mr. Kendig was handled. We would have an opportunity to address that --

CHAIR: Yup.

MR. INGALDSON: -- and you could have at least considered legal opinions on that issue but, more important, there are two other commissioners here. I understand that people are against this. It's a -- in their favor to have less people here. If they get rid of one more person, then they don't -- we don't have to have a hearing because no action can take place and I would just request for everyone who's put a lot of time and money into this and a lot of effort that we postpone this to the next hearing so we can have a full, fair hearing with all the commissioners here that couldn't make it because of weather tonight or for other reasons are not here and we would have at least a fair opportunity to address the one commissioner who is -- well, with all due respect, we think improperly recused.

CHAIR: Since I've allowed the applicant to speak, I'm going to ask the Borough, Mr. Aschenbrenner.

MR. ASCHENBRENNER: John Aschenbrenner, deputy borough attorney. I believe that, legally, the commissioners that are absent, if they choose to participate, can review the record and the testimony this evening and come to another meeting up to snuff. I think that's legally permissible. I leave it in the chairman's capable hands. We've had a great number of people including the applicant and staff ready for this evening and people have come here in weather conditions that

are adverse. So I leave it in your capable hands but I think, legally speaking, you've got a quorum, staff's ready to go. With a -- we have no objection to going forward this evening.

CHAIR: Thank you. As chairman, I have always, historical records, ruled by majority. So I would ask the planning commission of four to is there any objection to moving forward with public testimony tonight? Seeing and hearing no objection, I'm going to allow public testimony because there will probably be people that may not make the next one but I can tell you this is going to be extended for additional public testimony to a date certain so that we'll get everybody that wants to testify tonight and for an exception to the rule or just to make certain you understand, there are times if I extend audience participation and you've already participated, could preclude you but I've been told that it's up to me that allows you so if we have another audience participation, you will have another opportunity to speak.

MR. JACQUES: Mr. Chair?

CHAIR: Yes. The applicant.

MR. JACQUES: Stuart Jacques, Central Monofill Services. I would request that I get to reserve my presentation until all the members are present, all the members that are going to be voting are present.

CHAIR: Ms. Driscoll, the applicant want -- would like to

reserve his presentation.

MS. DRISCOLL: To the applicant, would you be willing to give it more than once?

MR. JACQUES: No.

MS. DRISCOLL: Would you be willing to give the presentation at this meeting and the next to better inform the public?

MR. JACQUES: No, I mean, I'm talking to four people here. I mean, half -- almost half of the Board isn't even here so I think I should have the -- this -- you know, the right to be able to provide a presentation to the full board. You don't get the same -- necessarily the same impact from just the written testimony and as far as other comments of -- you know, that people are here to give this, you know, we have significant written record in the planning commission's hands so, I mean, the vast majority of our presentation is already in the public's domain.

CHAIR: I've allowed the applicant to speak to that. Mr. Aschenbrenner, you have any comment?

MR. ASCHENBRENNER: John Aschenbrenner, deputy borough attorney. The staff is ready to proceed. The usual procedure is the staff makes its presentation and then the applicant gives their presentation. I think it out of the ordinary to have public comment on a conditional use permit go before applicant's presentation. I leave it in the planning

commission's capable hands but it seems to be a proposal that seems to defeat the -- having the full opportunity to comment on --

CHAIR: I understand. I believe it's out of the ordinary but, as chair, I don't believe it's -- it's up to our right to allow it and I've already proclaimed that we were going to have extended audience participation, a public hearing. So the final decision will not be rendered tonight and I cannot force the applicant to proc -- to make the presentation as long as I've said it's going to be extended because of the time of the day and rules we have for adjournment.

The borough attorney spoke. You have an opportunity to the applicant.

MR. JACQUES: Okay. If I have the right to do the presentation twice, then I'll go ahead and just do a short presentation this evening if that's acceptable.

CHAIR: Any objection by the Commission?

COMM. HEALY: Mr. Chair?

CHAIR: Yes. Mr. Healy?

COMM. HEALY: This public hearing was posted for tonight and a lot of people have devoted their evening to being here and I believe we need to move along in our process here. Our typical process is to hear a staff report and then hear a report from the applicant and then we have public hearing and I would like to get going on that procedure, frankly. If the

applicant chooses not to give a presentation this evening, then whether or not they give another one at the next meeting is, I guess, up to the Commission, but they will be given the opportunity at this meeting to do that. I think we have procedures in place and we should follow them. Obviously, this is probably going to carry on to another meeting.

CHAIR: I understand, Mr. Healy, and I think we'd all like to proceed as quickly as possible so we're all on the same team there and we just want to make certain that we hear from the Borough, we hear from the applicant, we hear from the audience and then we're going to extend and then if we hear from the applicant a second time, we also get to hear from the Borough. Mr. Strawn.

MR. STRAWN: Thank you, Mr. Chair. Alex Strawn, development services manager for the Matanuska-Susitna Borough. It is also part of the procedure not only to have a presentation at the beginning but the applicant will also have a chance to have a presentation at the end of public testimony. That is a normal part of the procedure so they would have two shots at it.

CHAIR: Thank you. With no further adieu, Susan Lee and Alex Strawn provide a staff report for Resolution 14-33, a resolution of proving a conditional use permit in accordance with 17.60.30, permit required for the operation of inert material monofill on Mat-Su Borough parcels as indicated. The

applicant is CMS. Proceed.

MS. LEE: Good evening. I'm Susan Lee, the planner that processed the conditional use permit for the proposed monofill. Central Monofill Services has submitted a conditional use permit application under the requirements of Borough Code 17.60 for the operation of a monofill for the disposal of inert material. The applicant has stated that the inert debris will be primarily the non-hazardous shredded residual non-recyclable waste material from construction and demolition waste. Regulated asbestos-containing material and non-regulated asbestos-containing material will also be accepted at the site.

In addition to the monofill, there will be salvageable recyclable materials in a storage yard that will be for sale at this site. Materials such as doors, windows, wood, bricks, glass, steel, culvert, pipe and broken concrete that had been removed from the waste stream are those types of items that will be stored in the separate area away from the monofill in the resale area.

The property consists of two pieces of property that are a total of 118 acres in size. There's one single access to the site from the Glenn Highway. The monofill footprint is proposed to be 35.5 acres within -- with a 16.5 acres used for the recycling operations. A conditional use permit is needed for 52 acres of the property. A scale house, maintenance shop

and other support facilities will be needed to support the monofill and recycling operations and will be placed out and the recycling operations will be placed outside the 35-1/2 acre monofill footprint. The placement of materials into the monofill is proposed to be over approximately 30 years.

Waste materials to be deposited in the monofill would be placed to fill the natural and manmade topography of the property. Tire bales will be used as structural berms and act as visual buffers by framing the sides of the cells to contain the debris. The sides of the cells will be constructed prior to building each cell which creates barriers on two or three sides helping to block the wind and contain the material. A total of 10 cells would be constructed over the life of the monofill.

The Alaska Department of Environmental Conservation permit regulations require the bottom of the monofill cells to be located a minimum of 10 feet above the established groundwater levels. Elevation of the bottom of the waste disposal cells will be established using historical groundwater information.

Building the cells will start at the southernmost part of the property and advance to the north. Each cell is proposed to be about 125 feet wide. There will be subcells created within the cells and, as the cells increase in height, the sides will be built up with tire bales that will be covered

with topsoil and seeded for revegetation. These cells will be wide enough to allow equipment to maneuver and place loads in the correct locations and material will be spread into two-foot lifts and compacted and this process will continue until the layers of the cell reach a depth of 15 feet. The working face receiving the inert materials will comprise at any one time an area approximately measuring 120 feet by 50 feet. The working face is the area within a cell where active filling is taking place and heavy equipment is compacting and covering the refuse. The maximum square footage that will be exposed and not covered at any one time during the monofill operation will be 25,000 square feet.

There will be two-way streams entering the facility. One stream if the material haul from a Central Recycling Services operation that has already been inspected and processed and the second way stream is the material hauled from known customers that has not been inspected. The general public will not be allowed to drop off or dispose of material at the monofill. Materials that have not been previously inspected or initially dumped on an impermeable inspection pad where they are inspected, recyclable materials removed and the remaining non-recyclable material placed in the active monofill cell.

The applicant states that if prohibited materials are found, they will be removed for proper disposal and any

contaminants will be cleaned up. After materials have been deposited in the cell, the materials will be spread and compacted and the waste material will be shredded to the size of 12 inches or smaller. The shredded, compacted debris will be covered with daily cover which is screen fines of material three inches or smaller and the debris will be covered with soil weekly.

Once the monofill cell is filled in -- to its final height, native soils, drippings, compost, will be spread over the top and slopes of the cell for a minimum of two feet. The final surface will be graded to drain in order to prevent surface ponding and reduce infiltration. A cap for the monofill will be seeded and will allow the establishment of vegetation over the surface to occur. All drainage will flow away from the working face of the monofill and a minimum of a two percent grade will be required. As the top sections of the monofill are completed to final height, 24 inches of native or imported soil will be spread over the top, serve as a final capped and allow the reestablishment of vegetation on the site.

The regulated asbestos-containing material and the non-regulated asbestos-containing material will also be accepted at the site. The regulated asbestos loads delivered to the monofill are packaged and sealed in leak-proof containers and placed within the designated cells. The materials are not

compacted by equipment to insure the integrity of the packaging. The maximum finished elevation in the monofill will be 162 feet above sea level. The adjacent Glenn Highway has an average finish elevation of 117 feet above sea level so the maximum height will be a little more than 40 feet above the Glenn Highway. The maximum depth of the monofill will be 75 feet with an average depth of 50 feet.

The past use of this property has been for earth materials extraction. There are three manmade dredge ponds on the site which are the result of previous dredge -- gravel dredging. The ponds are fed with surface water -- surface flowing groundwater. In 2004, there was a breach of the confining layer of the aquifer in one of the three dredge ponds that may have claim -- that many have claimed caused problems with the local water table AM waves (ph). In 2010, Brady Hydrologic Consultants prepared a groundwater modeling study to assess the impact of dredging at the Anchorage Sand and Gravel Palmer pit which is directly adjacent to the north side of the monofill site.

In summary, this reports -- so in 2010, J.A. Munter Consulting prepared a report for the Borough on the -- which was prepared regarding the effects of gravel extraction in an area south of the City of Palmer including the area of this proposed monofill and this report addressed the concerns about potential effects on there by water goils (ph) serving

individual residences and public water systems.

Oh, metals -- materials such as metals and sheetrock that have caused concerns for leachate productions are removed from the waste streams and large quantities of sheetrock are also removed from the waste and recycled by Central Recycling.

In 2003, Central Monofill Services submitted a conditional use permit application for the operation of an inert debris monofill at this location. That conditional use permit was denied by the planning commission. After that public hearing, the Borough hired J.A. Munter Consulting to prepare a hydrogeologic evaluation of the site and a very brief summary of that report, Mr. Munter states that there appears to be no significant effort to reduce or control infiltration or rainfall through the waste and no provisions for an engineered native soil or other liner, no impermeable cap. The 10-foot separation between the bottom of the waste and the water table is not insufficient and potential changes to the water table have not been evaluated and that the applicant did not appear to provide any substantive assurance that the aquifer is protected or that the groundwater contamination can be detected or be remediated should it occur.

In January of 2014, Central Monofill submitted a new conditional use permit application for this monofill. The Borough again hired J.A. Munter Consulting to review that

application and material and a very brief summary of Mr. Munter's 2014 report is that he states material disposed of at inert monofill will eventually rot, decay and leach into the groundwater and studies have shown increased concentration of contaminants from C&D Landfills. Only a small amount of some of the components or elements are needed to contaminate a large amount of water and the modeling shows that domestic drinking water wells could be contaminated from the monofill and that insufficient data analysis have been provided to accurately evaluate the effects of the proposed monofill.

In February of 2014, the Borough sent a letter to Central Monofill Services requesting additional information. In May of 2014, Central Monofill submitted response to that request and that supplemental include -- is included with all their application material, reports from four consultants and the following are some brief summaries of those reports.

Environmental Management, Inc., EMI, was responsible for the design of the monofill and they say that CMS did hire an expert in landfill design and assessment to review the design of the monofill and the landfill is designed to minimize the moisture levels of the materials so that the rate of decay and rot will be very slow and will not significantly impact any leaching if there's any leaching at all that leaves the monofill. The landfill's been specifically designed so that the waste will never stay in a saturated condition and they

found that the probability of creating leachate that will impact groundwater is so low that the groundwater monitoring is not necessary and recommend the submitted groundwater monitoring plan be withdrawn and not implemented. However, staff has recommended that this plan that they did submit initially be implemented as a condition.

The bottom of the monofills will be established based on all of the water data that is collected up to the time of construction of the cells. Maddox and Associates was hired by CMS to perform a review of the site hydrology and leachate concerns raised with the proposed monofill. The proposed monofill and a brief summary of their report is that the proposed monofill is located in a semi-arid climate where the balance between the annual precipitation and the annual evaporation precludes the formation of any significant volume of leachate. Any minor volumes of leachate that may be produced in the monofill will not have the ability to cause a significant impact on the underlying aquifer and that large quantities of drywall are removed from the waste stream.

The proposed monofill is taking in post recycling waste which is waste that's been processed to remove metals, appliances, et cetera, and the material that is brought to CRS is sorted, screened and processed to insure that the material is free of hazardous waste and putrescible waste and/or liquids. Every effort is made to insure that no materials

that may produce a harmful leachate will be present in the landfill.

The monofill will be located in a semi-arid environment where the annual precipitation and annual evaporation are essentially equal and the average annual precipitation rate measured at the Matanuska Agriculture Experimental Station is approximately 15 inches. Under these climatic conditions, particularly when the precipitation is less than 15.75 inches per year, leachate is not formed in a landfill. Alaska state requirements are met for a landfill with respect to the minimum separation from the water table of 10 feet and no liner required.

Modeling results have indicated that there will be no contaminant plume extending down and downgrading it from the landfill mass. As the working cells are completed and there is no working face, infiltration will decrease significantly as each cell is completed and the vegetative cover established, the volume of infiltration will be significantly reduced. As vegetation is added, most precipitation will evaporate. A simple top cover with vegetation will reduce infiltration through evaporation. As the landfill expands and more cells are completed with the final vegetative cover, the volume of infiltration building will be reduced and the volume of potential infiltration will be very low to begin with and will be further reduced as the landfill evolves cell by cell.

Excuse me, I need a drink.

CHAIR: You -- you're doing fine. Just so -- I'm going to interrupt you for a second. We're asking a lot of you to encapsulate 2,200 pages in 10 minutes and I think some of this is good and some of it is going over. I just want to make certain is this all on line and on public record that you're telling us?

MS. LEE: Yes, this is all in the staff report and all of the application material has been posted on line and made available.

CHAIR: So, clearly, we've read what you're saying but you're making it available to the public audience that may have not seen it on line or chose to pursue it and I just wanted to make certain that if somebody has to leave and if this is not making sense and we know we're going to extend audience participation, they can research this deeper on line and I guess I would like to know approximately how long you're -- before you finish with your conclusion.

MS. LEE: I'm going as fast as I can. I'm probably more than halfway done.

CHAIR: Well, let me just make certain -- I mean, obviously, you need to tell us although we've read it, you need to tell the audience and everything but, like I say, if somebody has to leave -- I seen somebody leave -- I mean, you're going to conclude with on page 77 recommending approval

of this conditional use permit with the following conditions is where -- if there -- somebody comes in. That's what you're going to end up with and you're stating your reasons. You have findings of fact and conclusion of law. We're not allowed to talk, ask you questions. Then we're going to hear from the applicant prior to the audience participation and I'm asking my commissioners if we get a little uncomfortable up here for a break, you're going to stay get a little uncomfortable because we're going to give the public, the audience, a chance to go out and get fresh air or go to the bathroom but we're going to try to stay here as long as possible but I do think the audience should get a time frame when I could -- when do you feel your participat -- your presentation, then the applicant's participation, what time do you think audience participation could open? I mean, just -- this is just reasonable and I think it's reasonable that you know, correct?

You -- many of you are here signed up to address us and you may not be able to be back and you want the information and what you're hearing is useful but a little of it's complex. This is very complex and complicated and I'm not certain that too much granular from either side is going to speed things up but, with that being said, you're halfway through so you feel you have 10 minutes and, Alex, you have a presentation?

MR. STRAWN: Mine will be short.

CHAIR: And then we have the applicant and then we have questions to the Borough and the applicant so I just think it's worthy to this audience because we do the people's business that they have a little bit of an agenda and a time frame. So if you're 10 more minutes, certainly, the applicants -- I believe the applicant's going to be 10 or 15 more minutes. I'd like the audience to know when they can start coming up and telling us what they have to say and, clearly, 2,200 pages, we could -- this could be an afternoon session. So I don't know how you encapsulate and use the meat but if you can get to what you really feel is pertinent and then we're going to have time because we're not going to be voting on this tonight, we're going to have -- continue audience participation. So how do I be thorough and respectful? This was -- as a chair, I want to be thorough and respectful. You came here and probably not anticipating not to get a chance to speak before 8:30. I would like to say between you and the applicant, if I could ask you to be completed with our questions by at least 8:30, 28 minutes, is that unreasonable?

MS. LEE: I'll speak very fast.

CHAIR: Well, just, you know, give us the information we need to have. Agreed? Okay. Proceed.

MS. LEE: As working cells are completed and there's no

working, base infiltration will decrease significantly. As each cell is completed and the vegetative cover established, the volume of infiltration will be significantly reduced and, as vegetation is added, most precipitation will evaporate. I think I -- a simple top cover of vegetation would reduce infiltration through evaporation.

As the landfill expands and more cells are completed with the final vegetative cover, the volume of infiltration will be reduced. The volume of potential infiltration will be very low to begin with and will be further reduced as the landfill evolves cell by cell. The most vulnerable portion of the monofill at any one time is the working face which is the area within a cell where active filling is taking place and heavy equipment is compacting and covering the refuse. The working face of the proposed monofill would typically cover an area approximately 120 by 50 feet.

The potential for the production of leachate at the monofill site is low based on the following facts. The proposed monofill is located in a semi-arid climate. The annual precipitation is relatively low. The annual evapo-transpiration is approximately equal to the annual precipitation. The ground is frozen during a significant portion of the year. No significant period of residency of liquids within monofill materials and no significant retort (ph) in areas of the monofill.

Another consultant that -- hired by CMS was Terrasat which tested the water quality excedents (ph) and these results from these calculations so that groundwater will not be significantly impacted. Terrasat evaluated infiltration process and potential leachate fate and transport through the potential monofill and two potential contaminants of concern were identified, one being sulfate and the other manganese. The results predicted the likelihood that analytes will comply with the ADEC drinking water standards.

Seven monitoring wells have been previously installed on the site. Three models were evaluated to explain processes of water infiltration into the proposed monofill. Alaska Chem Engineering was also hired in -- to investigate the infiltration, percolation and groundwater recharge near Palmer and that study examined the relationship between the precipitation and groundwater recharge in the area of south and west of Palmer pertinent to the proposed monofill and, based on their investigations, the proposed monofill would not cause recognized adverse health impacts from the contamination of groundwater and there appears to be (indiscernible) groundwater at the site primarily supplied form the Matanuska River and Talkeetna Mountain foothills.

The Borough reviewed all of the information provided by the applicant, by Mr. Munter, the public and we did make a recommendation for approval with conditions to mitigate issues

and so some of the high -- some of the conditions that we talked about regarding infiltration and those conditions are that an area no larger than a 120 by 50 feet remain uncompacted at any one time. The maximum square footage that could be exposed and not covered at any one time during the monofill operation would be 25,000 square feet. At a minimum, the monofill material would be covered with soil weekly and immediately after the tire bales were used for the site, higher bales were installed, they would be covered with topsoil and seeded for revegetation.

Conditions to address -- first of all, staff did go out to the Birchwood landfill where CMS is putting this same type of material out there and did conduct a site visit and in the debris, there are very small pieces of material, plastic material, whatever, that could easily become windborne at the site and we did have concerns about the material being contained on the site. So conditions that we put on there to address containment and windblown material on the site were to install a remote weather station at the site which would be to be set up directly and when sustained wind conditions at the site exceed 10 miles per hour, waste and materials should not be deposited at that site. When the sustained wind speeds exceed 15 miles per hour, all open areas will be covered with soil secured with tarps or other appropriate measures until sustained winds decrease to less than 10 miles per hour.

A -- catch fences will be installed downwind of active monofill cells at all times and the fencing mesh shall be a maximum of one inch in size. At the end of each day, the stockpile daily cover will either be contained within a covered trailer completely covered with tarps and secured to insure that material does not become airborne. The site will be monitored daily for windblown material and reasonable attempts shall be made to obtain permission to gain access to any properties where material may have blown onto the -- conditions to address the screening of the property have been put on there that it is required by code that the site be visually screened on a year-around basis from all travel or public rights-of-way and from the -- and we are also saying from the residential properties on the west side of the property. The maximum finished elevation of the monofill will not exceed 162 feet above sea level and, upon completion, the monofill will be covered with two feet of topsoil, seeded and slipped as described in the development plan.

Also, should the -- this operation be modified as a result of the Glenn Highway reconstruction project and updated site plan and plan of operations would need to be submitted to the Borough.

Conditions for groundwater protection were if it's found that groundwater has been contaminated, a corrected measure plan would have to be submitted to the Borough for approval.

The groundwater monitoring plan prepared for the site by Terrasat would have to be implemented and maintained and then conditions addressing the acceptance and handling and disposal of materials that materials have to be accepted in the monofill are described in the State of Alaska solid waste regulations. Materials not accepted at the monofill are PCB's or other hazardous waste, household waste, putrescible waste, liquids, compressed gas cylinders, batteries, appliances with CFC or HCFC, animal carcasses and petroleum-contaminated materials. Material brought to the facility that's not been previously inspected by qualified personnel will be deposited into a permeable pad for inspection prior to being deposited in the active monofill cell and if prohibited materials are found, they will be properly handled and disposed in accordance with all state and federal regulations and only previously-approved haulers will be allowed to bring material to the facility and that's the end of my presentation and Alex can --

CHAIR: Thank you. Clearly, as I stated previously, for you to encapsulate all this data is -- but on page 77 through 80 in our packet are the conditions that she was referencing so if there's anyone in the public who would like to see the conditions that are -- that she read part, there is 42 specific conditions that go along with their recommendation for approval. Again, no commissioner discussion at this time.

We may ask staff brief questions and then we go to the applicant and we go to audience participation. Mr. Alex Strawn?

MR. STRAWN: Thank you, Mr. Chair. Alex Strawn, Mat-Su Borough development services manager.

CHAIR: Place it loud, please.

MR. STRAWN: Thank you. So a lot of times on things like this when there's a long period for comments, a lot of them very useful and helpful comments come in at the very end and I've -- that certainly is -- we've received a lot of comments for the time and, certainly, some of the great ones have come at the very end.

I want to point out that this Commission is reviewing this development under MSB 17.60 and it's a code that is not necessarily tailored for this type of development but it does incorporate it and, specifically, there's actually six standards by which you're going to be reviewing this for. Last time it was denied primarily based on that the Commission could not find that the conditional use permit would not be harmful to the public health, safety, convenience and welfare. We recommended denial last time. This time we're recommending approval and it's essentially the same development proposal that there was last time. So what has changed? One of the big ones is that they have had multiple hydrologists review this. Before it was kind of in the dark, how is this going to

affect the water table. Did they have hired professionals that have spoken on their behalf or I think given an objective synopsis of what they think is going to happen?

So we're faced with this quandary that we have opposing hydrologists. We hired a hydrologist who thinks it could potentially contaminate drinking water wells and we're looking at three other hydrologists who say it won't and so we're put in a difficult position but, you know, looking at it, looking at the proposal, we submitted a very long list of -- you know, after they -- it got denied last time, CMS came to us and said well, what can we do to possibly get approval and we gave them a very long list of things that we wanted. You know, the code only requires a site plan and the application and here we have, you know, over a thousand pages, a couple thousand pages -- well, a thousand-page application so I certainly think they have done their due diligence as far as gathering as much information as they possibly can to show that they can re -- operate in a manner that does not pollute the water table.

However, I would say that it is with some reservation that we do recommend approval because there is conflicting reports. One of the -- Commissioner Healy had a very thoughtful question just recently, how much water -- how much leachate does the Mat-Su central landfill dispose of each year and the answer we just got today was 1.6 million gallons and that's -- I asked them so do you have -- what is your open

face that you have at any one time and the answer is seven acres and I did a quick calculation and if you do a correlation of seven acres compared to the 25,000 square feet that CMS will have open any one time, if you just do a one-to-one correlation, it'd be hundred and -- around 130,000 gallons of leachate that would occur given the same conditions and they do compact, they slope and everything like that, the same as CMS would.

So I don't think it's without risk if you were to approve it. I think CMS has been very responsive. They've been helpful. They've given us any information they've requested and I believe that there's a possibility that there won't be any problem if done correctly but I certainly would urge caution. We recommended 40 conditions and I think that is the bare minimum that you should require to protect the public health, safety and welfare. There are other conditions that you could adopt. You could require a liner and if you did that, we could help you with that. You could -- well, some of the concerns that have been brought up lately is -- or very recently is, you know, after it's been developed, 30 years have gone by and they've covered it with two feet of topsoil and they've seeded it, at that point, there's a potential that there could be settling, uneven settling, which could create ponding. So it also might be wise to adopt a condition that would require maybe five years of monitoring and regarding to

address that sort of situation and then, you know, I -- it's possible that 30 years from now CMS will not be the owner of this operation. They could sell it, potentially, and the permit would run with the land so keep that in mind. You know, they are a very capable company. They have a lot of resources available to them. They can -- they could, potentially, operate in a manner that's in compliance but some of the things you might want to look at is, you know, the final two feet of covering doesn't specify -- this is an oversight. It doesn't specify the permeability of that final covering. We would want it to be something that's somewhat less permeable than gravel, for instance, so you might want to consider adopting a condition that would have a cap that would be permeable no greater than 10 to the negative four centimeters per second and I'm sure they would probably be amenable to that but -- so, anyway, please look at the conditions, look at our findings and make recommendations -- or make a decision based on all that. Thank you.

CHAIR: Thank you, Mr. Strawn. No commissioner discussion at this time. Any brief questions for staff before I have the applicant present their overview of the application? Mr. Thomas Healy.

COMM. HEALY: Oh, thank you, Mr. Chair. Quick question, there was -- on page 66 right in the middle of the page of the staff's report, it says ADEC has approved the proposed

monofill design pending receipt of the Mat-Su Borough conditional use permit. I found a e-mail on page 1593 from DEC stating that DEC has not approved the permit. So I just need to clarify I guess the statement in the staff report that says that DEC has approved the monofill design and yet DEC seems to say they haven't approved it yet, they've received an application.

MR. STRAWN: I believe that they have not received final approval for -- from the DEC for this operation. I think one of the things that they're waiting on is approval by the Borough. We do have Lori Aldrich with the DEC here so she could certainly answer that question.

CHAIR: Mr. Healy, would you request further information at that -- this time or do you want to direct that to --

COMM. HEALY: If there's a brief explanation the staff or the DEC representative could provide, it might be helpful.

CHAIR: Please state your name for the record, ma'am.

MS. ALDRICH: Hi, I'm Lori Aldrich with the Department of Environmental Conservation solid waste program. The status of their permit application is that we have declared that the permit application is complete and at that point in the process, we go to public notice. Because there was an error in the public notice, we have gone out for a second public notice which is open now until December 29th and at that time, we will review the information collected and analyze it and

make our decision. We will ultimately produce a decision document and a response to all the comments.

CHAIR: Thank you, ma'am. Any other questions from the commissioners for the staff? Mr. Alex Strawn?

MR. STRAWN: I'm sorry, I do have one more point that I was hoping to make that I forgot.

CHAIR: Proceed.

MR. STRAWN: One of the other things that you should consider is that the water table is potentially a moving target. There are other factors that could change the height of the water table. One is there's an unresolved situation with the state regarding the spillway on -- in the separating the ponds just to the north which is on CMS property. That has yet to be resolved and nobody I don't think really knows what the resolution is going to be. However, there is a possibility -- one of the options that could potentially occur is that it would be required that that's spillway be essentially stopped, dammed, and that could change the hydraulic situation on the site. It could potentially raise the water table in that area as well as just in January of this year, we did have a Alaska Sand and Gravel to the north -- it's the immediate partner to the north -- or not partner, immediate landowner to the north is planning on having a very large dredging operation just to the north and they actually did submit a hydraulic report that says that it could raise

the water table up to two feet. That's contrary to a prior hydrology report that we said that could lower the elevation of the water table so there's a lot of uncertainty. One thing that's for certain that I think that the water table, as it is now, is certainly subject to change. So another condition that could be required just to be safe would be to require, potentially, a larger buffer between money operations and the water table potentially 12 feet or 15 feet or so and then another one -- or at least for the first cell or if you wanted to base it on until the spillway is corrected or whatever but it's certainly something so --

CHAIR: I appreciate that, Mr. Strawn, but for my own input, you in your conditions, you have a groundwater monitoring plan plus you have a guaranteed separation. So it'd be the obligation of the applicant to know where the water table is. If it's moving or not, it's up to their to know exactly where it is if they're going to operate under these conditions.

MR. STRAWN: Correct, but they could be put in a position where they place the material at 10 feet in compliance with the permit. The water level changes and then all of a sudden they're out of compliance which would put everybody in a kind of a bad situation.

CHAIR: Any other questions for the Borough? Mr. Thomas Healy?

COMM. HEALY: Thank you, Mr. Chair, just one other question. If the -- there are -- regarding the Glenn Highway expansion, there -- there's some plan views in there of the proposed development as it stands today which would impact a considerable amount of the area of this proposed monofill. You'd mentioned that if there were changes to the site plan as a result of that, those -- they would have to submit an updated site plan. Would that site plan be an amendment -- if the conditional use permit were granted, would that be an amendment to the conditional use permit that would be subject of public hearing and review?

MR. STRAWN: The intent of that condition is not that it would go before the public -- before the planning commission again. Rather, they would still be subject to the same conditions that could not be visible from the public rights-of-way. They'd have to have all the same conditions, they would just have to submit an updated site plan. Essentially, it would decrease the size of the operational data.

CHAIR: Thank you. For the members of the public, I said 8:30. I'm not going to ask the applicant to rush but we're clearly going to immediately after the applicant gives a presentation, we'll go to the public hearing and then you can state your -- address us and if you must leave, this will be continued and then we're going to invite the applicant to respond at the conclusion of this and if we can't get our

business done by adjournment which we -- which I have already said this will be continued. So, with that being said, if there's no questions for the Borough, I would invite the applicant or representative to provide an overview of the application and the commissioners may question the applicant or representative. No commissioner discussion at this time and if there's any particular specific areas that you want us to look at a map, you have the information in front of us, direct us to it. Otherwise proceed with your name, please.

MR. JACQUES: Excuse me. My name is Stuart Jacques. I'm the president of Central Monofill Services.

CHAIR: Proceed. Thank you.

MR. JACQUES: CMS has in front of you tonight a request for a CUP to operate a recycle facility and associated inert waste monofill. CMS is an Alaska corporation. CMS facility will support Central Recycling Services' recycling operation. Started in 2009. CRS addresses a large component of our waste construction and demolition debris. Comprising a quarter to a third of all waste generated, C&D has the largest potential for increasing recycling. As the only full-scale C&D recycling facility in the state, CRS has been making an impact with this project and, with this project, will be able to expand C&D recycling opportunities in the Mat-Su.

We will be able to collect recyclable construction materials at this facility, haul it to our Anchorage plant,

return residual materials to the monofill and provide recycled construction materials for sale. Seventy-five percent of the material collected is turned into recycled products and the other 25 percent of the residual material which has been inspected and sorted will reside in the monofill. CMS owns a similar permitted monofill in Salcha in the Fairbanks North Star Borough operated by CRS. This facility recently received a routine inspection by ADEC and was given a perfect score. The perfect score considered our records as well as a site inspection.

Access to the CRS facility in the CMS monofill is strictly controlled. These are commercial facilities and the monofill is not open to the public. The entrances to the CMS monofill is a fenced, gated and the gates are secured when the facility is closed or unmanned. The design and operations plan for the inert waste monofills are reviewed and permitted by ADEC. This proposed monofill is designed in strict accordance with the ADEC requirements. The only waste allowed to be disposed in this monofill is classified as inert material defined by ADEC. The inert materials that will be placed into this monoflll are the same components that your homes are constructed with. You physically encounter these same materials on a daily basis and whenever you perform any maintenance or remodel on your homes. Let me be clear, in contrast to unfounded allegations from certain members of the

public, no municipal toxic or hazardous waste will be accepted at the facility and no residual waste will be disposed into the ponds located on the property.

There -- the monofill has been designed to avoid contact with groundwater. The key to minimizing leachate is to provide as little opportunity as possible for precipitation or groundwater to contact or percolate through the placed waste. This monofill is designed to provide positive drainage away from the waste. The operations plan is designed to insure that the waste is placed in a limited, controlled area, compacted slope and covered in a timely manner to direct precipitation away from the waste. There are four separate detailed studies in the board's packet that show that, built as designed, little to no water will transmit through this waste.

There will be extensive emotion-based public comment throughout the evening and I understand that but I encourage the board members to ask me questions and make decisions not on emotion but on the facts. I understand where people are coming from on this issue. I've been in the same situation myself before. However, we need to make decisions based on the facts, not on fears and unfounded allegations.

Let me quickly address some of the issues, mis and unfounded allegations you will hear tonight. There's not enough time in this presentation to address each of these

issues in det -- in the detail they deserve.

The ponds. Regarding the ponds on the property, these are industrial ponds, not wetlands or waters of the U.S. The ponds are not included within the area of the CUP request. Comments regarding alleged impacts from the existing pond water levels on neighboring lakes and interactions with DNR -- with our interactions with DNR related to the pond water levels do not have impact on the monofill and are not a part of this permit application and, again, no residual waste will be placed into the ponds.

Mr. Strawn brought up the water levels and things on the spillway. If the spillway were completely dammed, the water level in that pond -- and there's been -- we've had a couple of hydraulic desetters (ph) and this would raise no more than eight inches. And also in regards to that, everybody talks about the failure of the spillway. That is -- no correlation at this point has been made to anything happened on -- with the spillway in those ponds with any neighboring properties. We are working with DNR. We've given access to our property to come in and do all their testing and to determine that. At this point, we can't be asked to continue to make modifications and make modifications and then go well, that didn't work, let's try something else. So we've asked them to give us a plan -- do the science, give us a plan and then we'll work with them on the plan.

Another one you hear is property values. You'll hear that if this CUP is approved, property values will drop dramatically and people will quit moving to Palmer. There's no validity to this allegation. There are currently two other monofills in the Palmer area within two miles of the site that have been in operation for at least 11 years. We have provided documentation in our package that confirms that the values of the properties located adjacent to these landfills have increased at the same rate as all other properties in the Palmer area. Growth in the Palmer area over the past 10 years has kept pace with other areas of the Mat-Su Borough. Residents living within a mile of the gravel pit are already required to mark a box on the real estate property disclosure form.

Windblown debris. You'll hear that trash from the monofill will blow all over the Palmer area. It must be emphasized that a condition of the CUP, several conditions of the CUP, is that the debris will be contained and not allowed to blow out of the monofill. We have a requirement to maintain a limited working face, install berms prior to placement of waste, install catch fences near the working face, cover the shredded topo when not being used for cover material and to cease placement of waste on days of high wind.

Leachate. Mr. Strawn just brought up the issue of leachate which has not been -- at that point, wasn't brought

specifically to us. However, comparing an inert waste monofill to a municipal waste landfill, they're not even the same animals. So when you talk about the amount of leachate that's generated by a municipal waste monofill, it's not even a close correlation to what happens in a -- an inert waste monofill. Approximately and maybe more than 50 percent of the percentage of the waste that goes into a municipal landfill is water. There's going to be a dramatic amount of leachate in a municipal landfill. Not the case in an inert waste. So trying to make the correlation you made of the square footage and think this amount of open face versus this amount of open face is going to create this much leachate, that -- that's not even close to an accurate evaluation.

The other thing I think is important, we don't have to -- there's a lot of public comment about what will happen and all these things that will go on. We don't have to imagine what the impacts of this monofill will be to this area. Alaska General Monofill and the Mat-Su Borough Monofill are opera -- are already operating within two miles of this site and accept the same types of waste with much less screening than CMS will perform. Have the property values around these sites plummeted? No. Have people quit moving to Palmer as a result of them? No. Are the residents located around these mon -- are the residence wells located around these monofills contaminated? No. Are dust clouds blowing around

contaminating the local residents from these monofills? No. Is trash blowing all over Palmer from these -- well, okay. Trash is blowing all over from a variety of sources and I'll mention also, you know, Susan made the comment that you guys visited the landfill at Birchwood that were operating there and, yes, there is that small debris stuff from our material. However, what you failed to mention to them was that you also noticed that none of it has blown off of the site.

As a property owner in the Mat-Su Borough, CMS has the same rights to use our property for our own use as any other property owner in the Mat-Su Borough with limita -- within the limitations of the Mat-Su Borough Code. As presented and agreed by staff, we have met the Mat-Su Borough Code requirements for approval of the CUP in front of the Board. As I understand from the MSB website, part of the planning commission's mission is part quasi-judicial in nature to, I quote, review all aspects for enactment for amendment, platting and land use regulations in conditional use requirements.

We believe -- and I quote from the Board's mission statement -- that we have, quote, met all the established requirements to give them a right to a permit or other entitlement. Again, in Mr. Strawn's wrap-up, he talks about increasing the depths from the -- of the separation. That hasn't been discussed. That's not a requirement of the law.

We're doing the thing in strict requirements with the ADEC regulation. I see nothing in the Mat-Su Borough regulation that requires a specific separation distance that exceeds that of ADEC or, you know -- or any of the other requirements that are in excess of ADEC's requirements. Again, the monofill is designed in accordance with the law and in accordance with the Mat-Su Borough Code.

So we did all we could to address the conditions with staff that they place, the 40 some conditions, but we do have two conditions we'd like to discuss further and I don't know if we do that now with the Board or how that works so --

CHAIR: I think I would like to go to the public hearing and then --

MR. JACQUES: Okay.

CHAIR: -- and then the conditions, we're going to be going over those if we have any changes or recommendations that are going to be part of that process.

MR. JACQUES: Okay. And we can do that at the end?

CHAIR: Absolutely.

MR. JACQUES: Okay. That works. We hope that you approve this CUP request. Thank you for your time and, again, request if you have any questions regarding our proposal, do not hesitate to ask me. There's a lot of complicated issues here. The only way we're going to get through those is if the Board asks questions and we'd be happy to answer those rather

than walk through every part of the package.

CHAIR: Mr. Jacques -- that's how you pronounce your last name?

MR. JACQUES: That's correct.

CHAIR: You've articulated that well and we've asked a lot of you and we've asked a lot of the Borough to try to reiterate 2,000 pages of information. There's been a lot of studies. There's been a year's worth of work by both of you that, clearly, Mr. Kendig and I have related to what we've spent the last week on and some of us the last year. So I do want to get to public hearing but for those that have not heard me, I'm not going to close audience participation -- excuse me, I meant public hearing. I'm not going to close public hearing tonight just because this is too complex of an issue to rush through it. So we've asked both the Borough and the applicant to time certain that we'll decide when we are going to reconvene for public hearing but we have the opportunity now for brief questions to the applicant before I open public hearing. Questions? Mr. Thomas Healy.

COMM. HEALY: Thank you, Mr. Chair. Mr. Jacques, a couple of questions. I didn't see cover material. You're -- there are some areas that are going to be filled as you build the monofill but then there are, you know, one-foot lifts.

MR. JACQUES: Yeah.

COMM. HEALY: All that cover material that you're

proposing using will come from that site?

MR. JACQUES: No. Well, you mean the final dirt -- the dirt lift in between the cells? That will come from the site, yes.

COMM. HEALY: Okay. Then -- but the cap or whatever will be --

MR. JACQUES: Yes. Well, some of that cap we may have to import in, you know, but we need to -- the final cap is the vegetative mater -- so we're going to have to import some topsoil and things like that in.

COMM. HEALY: I know -- I'm trying to be quick here. Another question -- and I just have one other comment. What is the standard for long-term management and monitoring of sites like this? Is there a state standard where -- you know, the permit is good for what is it, 30 or 40 years --

MEMBER: Thirty years.

COMM. HEALY: -- 30 years and after that, assuming the thing is capped and done, what are the -- who's responsible for -- these things are in the ground, it's a long-term issue.

MR. JACQUES: Mm-hmm.

COMM. HEALY: What are the kind of management and monitoring requirements in the years beyond?

MR. JACQUES: I can address part of that question and maybe Ms. Aldrich should address the remainder of it but we're the property owners so we have a vested interest in

monitoring, you know, what goes on our property. I mean, we have a significant financial interest in if there's a problem or any type of thing like that. So our monitoring will continue on from a -- we're obligated to provide a bond and we have insurance throughout this so we've met -- we'll meet the requirements of the regulatory agency in that regard.

COMM. HEALY: Okay.

MR. JACQUES: I'd say Ms. Aldrich could probably answer the rest of that.

COMM. HEALY: That's fine. And one more comment, Mr. Chair, Mr. Jacques --

CHAIR: Proceed.

COMM. HEALY: -- mentioned there were two conditions. You had an issue after you'd like to propose?

MR. JACQUES: Mm-hmm.

COMM. HEALY: I would suggest that we hear those now so the -- those present hear them before the public hearing portion just so they have all the information or as much as they can.

CHAIR: Any objection? If you could encapsulate that with not a lot of detail, please?

MR. JACQUES: Yeah, they're not overly significant so --

CHAIR: Proceed.

MR. JACQUES: -- but the first one is Condition 13, when sustained cond -- wind conditions on the site exceed 10 miles

per hour, waste material should not be deposited at the site. Our proposal, we had proposed 20 miles an hour in a sustained wind and so I don't think that that's necessarily unreasonable and, you know, we -- we're going to have an extensive amount of containment around there, fencing, berms, limited amount of face open. I mean, the -- we're going to have, you know, a significant amount of grow -- and then we're still liable if it blows off of there. If we don't meet those conditions, then we're in violation of the code and then we'll have to deal with it. So -- but, you know, I'm just trying to make it to where it's a workable situation also.

And then the other is Condition 36, hours of operation shall be limited from 7:00 a.m. to 7:00 p.m. Now, I don't have any real problem with that for the monofill portion of the property. We don't intend on operating beyond those hours but the other part, the recycling area of the facility, we may want to be able to bring in materials, you know, in the evenings or -- and on Sundays, you know, for the public. I mean, you know, the public is not necessarily working within these hours and we may have an office facility and all of that type of stuff. There's a -- for that portion of it, I'd like to be able to have standard working hours just like any other business in town but I have no problem with this for the monofill part. That -- that's all I have.

CHAIR: Thank you, Mr. Jacques. Any other questions for

the applicant? Before I open up the public hearing, I just had two. For the record, I just want to make certain I understood what you said. When you mentioned we received a perfect score, would you tell me again a little bit what that perfect score and who gave it to you and what that was about?

MR. JACQUES: Certainly. It's in your package. It's in the package, actually.

CHAIR: Mm-hmm.

MR. JACQUES: It's from ADEC, the Fairbanks division of ADEC. Our mono -- the monofill at Salcha is regulated by -- I don't know what page -- do you know what pages it is in the package, Susan?

CHAIR: I'll find it.

MR. JACQUES: Okay.

CHAIR: I just thought I left it everything (ph).

MR. JACQUES: But, anyway, we provided that in here and so what they do is they go through and they do a -- an inspection checklist and they go through a whole variety of, you know, pages of items and they inspect our records and they inspect the site and they go through everything and in the end, we received a -- 250 points out of 250 points.

CHAIR: Thank you. I will research that a little closer and my final question was --

MR. JACQUES: And for --

CHAIR: Yes?

MR. JACQUES: And their comment on it was this facility is being managed and operated excellently and received a compliance score of a hundred percent during this year's inspection. Great job.

CHAIR: Is there a signature on there?

MR. JACQUES: Yes, Neil Laner (ph), environmental program specialist, solid waste program --

CHAIR: And the date on that document?

MR. JACQUES: October 1st, 2014.

CHAIR: Thank you. I will research that further and my -- I just want to make certain again and clear on the record. Obviously, there's a lot of concern about leaching and water and I think you made reference there will be little or no water will leach. Little or no water will leach, I believe, were your words.

MR. JACQUES: Mm-hmm.

CHAIR: What can we, as the public, or what -- those in the public, how can we -- where did you base that on, little or no water will leach?

MR. JACQUES: Well, there's several hydrology reports in here that confirm that statement. They've run modeling and they've run sampling with our -- with the material that we're placing into the monofill and, you know, that's how it was designed, in such a way that to -- so that we brought it up in certain amount of lifts, we compacted a certain way to avoid

having water come through that. That's why the face is only a certain size, it's not an extremely large open face. Unlike Mr. Strawn said at the borough landfill, our open face is significantly smaller to avoid allowing precipitation to come through there. Everything is sloped to avoid any type of ponding or an -- to allow any of the precipitation to stay for any amount of time. The key to that is keeping precipitation from being able to stay long enough in a spot to be able to go down through and percolate into the waste.

CHAIR: So excuse me if this question's elementary but if it really rains a lot and you get a lot of snow and that water goes on top of what you put in there, where does that water go, just kind of sits and the --

MR. JACQUES: Well, most of it'll sheet off of there just like it would sheet off your lawn or your -- or any other place. I mean, you know, that'd be very similar, I guess, really, to go to your lawn after a hard rain like you do now.

CHAIR: So instead of percolating through, it would go off?

MR. JACQUES: That's correct.

CHAIR: Thank you, sir.

MR. JACQUES: Yeah, because it will be compacting.

CHAIR: Any other questions? I'm going to try to move forward. Thank you. Any other brief comments from the borough staff before I open up public hearing?

MR. JACQUES: No further comment.

CHAIR: Thank you. At this point, it comes to the item on the agenda for a public hearing and, clearly, it's three minutes per person for members of the public and out of respect each and every one of you, you know, you can have up to three minutes. There's brilliance in brevity. If you can get your point across in one minute or two, so be it, but I want to -- I really ask you to prepare mentally that if your most strongest point -- make certain if it's at the end, that it doesn't come after the microphone's turned off and if I allow somebody just to say wrap it up, wrap it up, then the next person's going to take it and then I'll abuse all your privileges. So three minutes unless you happen to be the Palmer mayor or you happen to be the president of a homeowners' association or --

MS. BRODIGAN: Community council.

CHAIR: Community council. I erred, it's not homeowners' association, it's community council. Excuse me and thank you, Ms. Brodigan, and I didn't mean to call out the Palmer mayor, if you're the city mayor, if you're the Wasilla mayor, I believe. So if you're the head of a state agency, a city or borough official, you could use up to five but let's be respectful and, remember, I am not going to close, I'm going to extend public hearing so if your point's been made by someone and you want to say I want to remove myself from the

list or come to the next one, you don't have to mandatory and I've looked through here and everyone's got good handwriting and, ordinarily, I want this on public record exactly who I'm speaking to but I have Joe Moore and Wetherell and Landi and Goodman and everybody wrote in clear, legible handwriting. So I am going to take them as it was signed up and we will get through as many as we can and, again, we don't allow applause or boos. If we'd allow one, I'd have to allow the other and I do have the authority to enforce it and so we're here for the -- all for the right reasons and the same reason and it's to get as much information as we can to make an informed decision. With that, I will take them in rotation and then I'm going to call two names so that if we could find a chair -- how could we do this, Alex? Could we get an extra chair so that there could be one or two person that's ready to go up so that we don't delay minutes in coming up? I appreciate that, Mr. Ingaldson, and the timing will come on. The microphone is red. Just state your name in your own voice and no need to spell it unless I ask for it.

We have Rose Williams and then we have Craig, I believe, Kelly and Sarah Mayfield.

MS. WILLIAMS: So the mike's on? Okay. My name is Rose Williams. I'm here again this evening to address the Mat-Su Planning Commission. I find that very sad. I was here in June, 2013 for the very same purpose. We, the owners of the

-- the owners who live downstream of this proposed dump expressed our valid concerns concerning this permit. The permit was denied and yet here we are again and I'm just kind of puzzled by that.

We spoke that evening of how the company in question had already let asbestos-tainted trash blow into our community, how they illegally dump garbage from Anchorage, how they had already been burying trash illegally and how they were dumping garbage into an open aquifer. All this they had done even before they had a license. This is -- they showed us really how they operate. I don't know that they've changed and these are all facts. I'm not making any of this up.

They want to build a dam between lakes over an aquifer that is the water source for the communities downstream. They're hoping nothing goes wrong. They are counting on Mother Nature to be absolutely perfect. They're not counting on any extra waterfall, they're not counting on any rain. They're not counting on any earthquakes. They have no plans for having a liner for their facility. They are willing to risk our clean water for their financial gains. They are hoping you, the borough planning commission, will allow this to happen and I am asking you to put the health and welfare of the (indiscernible - coughs) and the children of our community above the all mighty dollar. I'm asking you to have a long-sighted view of health and prosperity for everyone, not just

one company.

This is a social justice question. This is a moral issue. This is a moral test for you guys, for you, our planning commission, are -- to -- are you willing to do what's -- you have to ask yourself what is more important, the financial gains of one company or the health and welfare of a community of 500 or more families. Once you pollute a water source, it's polluted forever. This is a bell that you can't unring. Our water is perfect, clean, fresh and without taint or smell. I keep hearing that all the hydrology reports say that there'll be just small changes to our water, nothing significant. Well, my water's perfect and I like it that way.
